THE ART-JOURNAL.

LONDON, JANUARY 1, 1876.

ARTISTS' MARKS.

CASUAL glance at the present page might induce our readers to imagine it devoted to some abstruse paper on Coptic manuscripts, Egyptian hieroglyphics, or possibly on Babylonian inscriptions, aided by the research of Colonel Rawlinson himself. It is, however, sacred to no such profundities, but is intended simply to display some of those curious forms adopted by artists to stamp their own works as authentic, in the same way as the goldsmiths, silversmiths, and potters did theirs, and which it has been our province to describe in our preceding volume.

Some artists have been content to exhibit the initials of their names, combined with that of the place of their birth, as in Fig. 1, which is the mark usually adopted by Israel Van Mechlin (born 1450, died 1503). He, however, varied the marks on his works, and sometimes only adopted the large flowing I, seen in Fig. 2, at other times he formed the name *Israel* into a fanciful monogram, or used the old German letters, I. V. M., as his marks; sometimes the letter I. passed at a right angle through the M., then, occasionally, V. M. only appears; so that in the instance of this artist we find as much variety as is displayed in the marks generally adopted by one man. Fig. 3 exhibits the sort of mathematical figure used by Hans Van Aken (born 1552, died 1615), a painter of the Low Countries, and a native of Aix-la-Chapelle.

Fig. 4 is the cypher used by Albert Van Everdingen, the painter and engraver of the Netherlands (born 1621, died 1675); it is a combination of the three first letters of his name, fancifully disposed. The mark, Fig. 5, was adopted by Crispin Van den Brock, of Antwerp (born 1530), who practised painting, and engraving on copper and wood; the combination of letters which he has adopted signifies *Crispin, inventor, Antwerp*. Fig. 6 is that used by Agostini Caracci, to mark his engravings (born 1557, died 1602); it is A. C. F., for A. Caracci,

fecit, at other times he used the A. C. alone. Fig. 7 is the monogram constructed by Spagnoletti (born 1588, died 1656), to distinguish his works, and consists of the letters of his proper name, Ribera, with the omission of the letter E. The upright line of the A. also serving for I. in his Christian name, Joseph.

There is an artist whose works were known in the middle of the sixteenth century as those of "the master of the caltrap," from his using that implement as his mark, Fig. 8. The caltrap was an instrument used in Medieval warfare, and consisted of a group of iron spikes, which were cast upon the ground, to wound the feet of horses and impede a charge of cavalry. Fig. 9 is the mark of Francis Mazzuoli, better known by his sobriquet of Parmagianino, from Parma, the place of his birth, (in 1503), which he has here adopted in combination with his Christian name. Fig. 10 is the florid initials of Johann Friedrich Greuther, a Dutch engraver, born in 1600, died 1660. Fig. 11 is the quaint combination of F's, all forming part of each other, used by Franz Friedrich Frank, another Dutch engraver, who flourished from 1627 to 1687. The last two are good examples of the *florid* and the *formal* styles of initial.

The old merchants universally adopted a series of marks to distinguish their sales of goods; and as they were not allowed, however rich they might be in the middle ages, to adopt arms, and thus rival the dignity of the gentry, these marks were used upon shields, similar to those upon which heralds emblazon their fancies. Hence many an old tomb and church window is thus decorated. Some few of the old artists adopted similar elaborations, and the mark, Fig. 12, is a good example, being that used by Jost Van Winghen, who lived from 1544 to 1603. Very frequently these old merchant-marks were combined with a figure of 4, which some

writers have considered to be a rude representation of the mast and yards of a ship, indicative of their trade, in the same way as shown in Fig. 15, which was used by the artist Raphael de Ravenna. Fig. 13 is another fanciful mark, also much like a merchantman's, used by Augustin Hirschvogel, a German engraver, born 1504, died 1560. Fig. 14 was adopted by the Italian engraver, Gabriel Gholiti, of Ferrara, who flourished in the early part of the sixteenth century.

Nicholas Roser, of Modena, who lived at the same period, adopted the somewhat fanciful mark, Fig. 16, which bears no allusion to his name, but may, possibly, to his native town. The painter, Elias Rei-

dinger (born 1695, died 1767), used the quaint arrangement of his initials, engraved Fig. 17. George Bobba, an Italian engraver of the latter part of the sixteenth century, combined the letters of his surname, as in Fig. 18. Bernhard Graat, a painter of the Netherlands (born 1628, died 1709), placed the initial of his Christian name above a *grating*, indicative of his surname, with the letter *f*, for *fecit*, beneath, as shown in Fig. 19.

The wood-engraver, John Operin, of Basle (born 1509, died 1568), combined his initials as in Fig. 20. Martinus Martini, the engraver, of the early part of the seventeenth century, used the sort of double M, seen in Fig. 21, sometimes surmounted by the bowl of a tobacco-pipe. Antonia Tempesta, the painter (born 1555, died 1630), employed the monogram, Fig. 22. The German painter, Ludwig Von Ring (born 1496, died 1547), used the flowing I, upon which a ring was hung, as shown in Fig. 23.

This plan of using a figure for a name was very customary in the middle ages, and such an invention was called a *rebus*; it was natural that artists should particularly prefer such pictorial nomenclature. Thus, Martin Rota, the Italian engraver, used the *rota*, or wheel, for his mark, as in Fig. 24, accompanied by the initial of his Christian name, and the word *fecit*. Ludwig Krug, the German goldsmith and engraver, placed the Jug, symbolic of his name, between his initials, as in Fig. 25. Gerard Lairese, the painter (born 1640, died 1711), adopted the fanciful double combination of initials seen in Fig. 26.

The wood-engraver, Tollot, about 1530, used the mark, Fig. 27. Another more famous practiser of the art, Hans Schaufelin (born 1492, died 1540), used the letters of his name, as in Fig. 28, or the two small shovels, such as are used by bakers, as in Fig. 29, which afforded a punning allusion to his name. Herman Ring, a German painter (born 1540, died 1597), adopted the ring in his initials, Fig. 30, as used by his predecessor, Fig. 23.

Albert Durer (born 1471, died 1528) used the open gates as a rebus of his name, Fig. 32, and adopted from the similarity of sound between his name and the word *thor*, or gate, in German; they generally enclose the initials of his name and the date at which each particular work was executed, as in our example. The great painter,

Corregio, used a heart, indicative of the first syllable of his name, and inscribed the rest above it, Fig. 33,—or else, as in Fig. 34, crowned his heart, as *cor regio*, placing the usual designer's word upon it.

George Hofnagel, the German painter and engraver (born 1575, died 1629), whose name literally signified *Housenail*, rejoiced in marking his works with a large nail, as in Fig. 35, sometimes entwining it with the first letter of his Christian name, as in Fig. 36, or else with the last, as in Fig. 37; at other times he used the great nail alone, upon which was inscribed his Christian name, latinised, as in Fig. 38.

Johann Maria Pomedello, an Italian engraver of the early part of the sixteenth century, used the mark, Fig. 39, consisting of an apple, indicative of the *pomme*, in his name; which was further "punned on" by Isabella Quatre Pomme, living at the same time, who placed the number 4 on her apple, and completed a perfect French rebus of her name, Fig. 40. The German engraver, Hopfer, at the same era, marked his plates with the small tree, Fig. 41. Francis Sebastian Scharnagel, the painter and lithographer of Bamberg (born 1791),

adopted this old custom, by placing Fig. 42 on his works, indicating the literal meaning of his name, *share-nail*. Fig. 43 is one of the most curious of these whimsical marks; it was adopted by an Italian engraver in the early part of the sixteenth century, who was hence known as "the master with the rat," his name being Ratto. With the same feeling, Hans Weiner, the German engraver of 1590, used the bunch of grapes, Fig. 44, indicative of the *wine maker* his name literally signified. Ulrich Pilgrim, the German wood-engraver, who flourished about

the same time, adopted the cross *bourdons*, or walking-staves of the pilgrims, Fig. 45. The Italian engraver of the fifteenth century, Lucca Fiorentinus, placed his initials on a shield, as in Fig. 46. Lucas Cranach, the German engraver (born 1472, died 1553), used the winged dragon holding a ring in his mouth, Fig. 47; at other times he adopted a shield with two swords crossed; and at others the arms of the Electoral Princes of Saxony, by whom he

was patronised. Sometimes two or three of these marks are found together in one of his pictures, or engravings.

In speaking now more particularly of painters' marks, the place of honour must be given to Raphael, who sometimes used the combination of the four first letters of his name, as in Fig. 48. Philip Wouvermans combined those of his Christian name, as in Fig. 49. Paris Bordone used the mark, Fig. 50. Jacob Palma, returning again to the rebus, gave a palm branch with his initial, as in Fig. 51. John Wynants used the boldly flowing initials represented in

Fig. 52. John Vandervelde, the quaint combination of an I and two V's, seen in Fig. 53. Carl Van Mander used an equally fantastic compound of his initials, as in Fig. 54. Gerhard Terburg adopted the mark,

Fig. 55, which includes a letter for each syllable of his surname. This plan was also adopted by Daniel Lintmayer, in the scrawling initials, Fig. 56. The Italian painter, Dosso Dossi, used the large D with a bone through it, as in Fig. 57. Another mark used by Vandervelde is given, Fig. 58. That

adopted by Andrea Mantegna is shown, Fig. 59. Jost, or Justus Ammon, a wood engraver, extensively employed by the booksellers of his era, (he was born 1539, and died 1591), distinguished the myriad of curious and beautiful cuts he gave to the world by the initials engraved, Fig. 60. In Fig. 61, we have exhibited a mark used by the painter Tempesta, Fig. 61 is another, which is a combination of *A. Temp.*, an abbreviated form of his name. Hubert de Croock, a German wood-engraver of the close of the fifteenth century, used the mark, Fig. 62,

which combines the H and C of his name with the pastoral staff, or *crook* of the Romish Church. The painter, Nicholas Berghem, adopted the CB of Fig. 63, the C indicative of the familiar Dutch abbreviation of his Christian name into *Claas*. Annibale Caracci used the mark, Fig. 64. The small and modest *a. v.*, in Fig. 65, is the mode in which the great Vandyke marked his works. Fig. 66 is another variety of mark adopted by Tempesta (see also Figs. 22 and 61).

The Dutch painter and engraver, George Wachter, in the early part of the seventeenth century, used the quaint initials of

his name, Fig. 67. Johan Van Sommer, about the same time, used Fig. 68 as his mark. Theodore Kaiser, another artist of the same period, used Fig. 69. We now add a fourth instance of Tempesta's marks, Fig. 70; while Fig. 71 exhibits that of the Italian painter, Sebastian Ricci.

We have thus given fair examples of the great variety of fanciful modes adopted by artists and engravers of all grades and at all periods to identify their works, comprehending initials, monograms, and emblems. The custom of using quaint marks is now almost entirely confined to initials; there are, however, some few instances of the old practice of punning in our own day, as when Richard Doyle placed a (*Dickey*) bird for the mark to his designs in "Punch," or John Leech exhibited a *Leech* in a bottle,

for his; these were good-natured comicallities, well fitted to such works, if not a quiet satire on the practice. We conclude our series with a few examples of marks used by artists and engravers of the last and the present century. Fig. 74 is the abbreviated name of John Henry Ramberg, the German painter and engraver, (born 1763). Fig. 75 is that used by our famous mezzotint engraver, James Mac Ardell (born 1710, died 1765). Fig. 73 is used by Eugene Nenreuther, of Munich, (born 1806); and Fig. 72 that adopted by his great fellow-townsmen, Peter Cornelius, (born 1786), who has done so much to elevate the Fine Art of his country.

F. W. FAIRHOLT.

BRITISH INDUSTRIES.*

No. VI.—DEVONSHIRE MARBLES.

It has often appeared to us, that we do not sufficiently value the productions of our own Islands. That which is foreign is highly esteemed, while, too commonly, that which is produced at our doors is regarded as valueless. With our increasing wealth this feeling has certainly been fully developed, and articles of taste are valued more frequently by a scale, graduated according to the distance from whence they are brought, rather than by any intrinsic excellence. To this passion we find many excellent caterers. The less wealthy, but no less industrious inhabitants of many Continental localities, seek for native productions, and moulding them to suit the prevailing tastes of England, realise large profits by materials which to them were formerly valueless. In these remarks, let it be understood there is no intention to undervalue the productions of the Continent. It is desired only to direct attention to sources at home from which articles of equal beauty could be obtained if the wealthy amongst us would but lead the way in this direction.

The black antique marble—the *Nero antico* of the Italians, the *red antique marble*, *verde antique*, the *marmo verde pagliocco*, the *Cipolino marble*, and the *rose-coloured breccia*.

* Continued from p. 258, vol. for 1855.

cia marble, have all of them been rendered famous by the works which have been executed in them; and hence, for ordinary purposes, these marbles are bought at an extravagant cost, when we have ornamental stones in our own island surpassing many of them in beauty.

The limestone formations of Devonshire and of Derbyshire produce a variety of coloured marbles of high character. Black, white, grey, red, and brown varieties are found in both these counties. Wales and Westmoreland can yield from their carboniferous and transition limestone beds several most agreeable dark marbles. The green marble of Anglesea, the Connemara marbles of Ireland, the white and variegated marbles of Scotland, and the beautiful serpentine of Cornwall, to which we have already more than once directed attention, may be quoted as a few examples of our British resources.

Although we have been long acquainted with the numerous varieties of stone produced from the limestones of Devonshire, our attention has been more especially directed to them during the past autumn. The peculiar geological character of these rock formations—the picturesque beauty of the country in which they are found—the romantic arrangement of the rocks themselves along the coast in the neighbourhood of Torquay, and the adaptability of this material to numerous purposes of decorative art—are so many inducements for us to devote an article to their consideration. This district has been so carefully examined by some of our most skilful geologists, that no apology is required for availing ourselves of the information they give us.

The following general sketch of the coast is from the pen of the late Sir Henry de la Beche—

"There is no beach to the cliffs from near the Ness-point, at the mouth of the Teign, to Hope's Nose, the northern point of Tor Bay, with the exception of the bottom of a few coves, and the Babbacombe Sands, and their continuation, the Oddicombe Sands, both misnomers, for they are shingle beaches. The cliffs plunge directly into the sea, and are well seen only from a boat. The coast is equally bold from Hope's Nose to Torquay, with the exception of Meadfoot Sands, which are, however, backed by a high broken hill. After passing the hill, between Torquay and Tor Abbey, the coast assumes a milder character; the cliffs, where they occur, are of no great elevation; and there are extensive sands both at Paington and Goodrington, separated by Roundham Head. Further south, low cliffs intervene between Goodrington Sands and the Broadsands. Beyond the low rocky land of Galmpton Point the cliffs are bolder, and continue so to Berry Head, being in a few places broken into coves, the most considerable of which is occupied by the harbour of Brixham. This range of coast is backed by hills varying in height from 200 to 500 feet. Furland Hill, between Brixham and Dartmouth, is 589 feet above the sea."

If we look at a geological map we shall find the limestone formations commencing on the edges of the red sandstone series, and spreading in detached masses—islands as it were—amongst the clay-slate formations to Plymouth, at which place they may almost be said to terminate. It is true, that in the neighbourhood of Looe, and at some two or three other spots in Cornwall, small patches or veins of this limestone are found, but never in any quantity. The eminent geologist whom we have already

quoted, writes thus of the limestones of St. Mary Church, Babbacombe, and the northern side of Tor Bay—

"These encircle the old red sandstone, which extends from Meadfoot Sands towards Upham. The section on the south side of the Meadfoot Sands shows the limestone resting on old red sandstone. The quarry at the south-west points, opposite a rock called Shag Rock, is marked in grey and reddish compact limestone, dipping south west; beneath is an argillaceous shale, reddish in the upper part, and grey in the lower.

"The limestones in the vicinity of Torquay are much disturbed, as are also, more or less, all the stratified rocks of the district." So much confusion exists in the vicinity of Torquay, that no regular dip of the limestones can there be determined. They dip S.S.W. at an angle of 35°, near the turnpike, and at the quarry near the baths, to the S.W. They are perpendicular, with a north and south direction, at a little hill near Tor-Moham, at the Chapel Hill, and under Torwood House. At Stantaway Hill, between Tor-Moham and Upham, the calcareous slate and limestones are much confused. On the road from Torquay to St. Mary Church, at the entrance of the rocky defile, irregular, detached, and arched strata, have a very picturesque effect, the arch appearing to be almost a work of art. The coast also, from Babbacombe to the Black Head, exhibits confused strata of limestone and argillaceous shale; at the latter place we may observe a thick bent stratum of limestone included in the solid trap; this limestone is very crystalline. Hope's Nose, with the Leadstone, Oarstone, and Thatcher Rocks lying immediately near it, are composed of limestone much contorted at the cove north of the Thatcher. This mass of limestone is detached from the limestone on the west, that is above the level of the sea; and, beneath they are probably connected with the Torquay beds, for the Thatcher Rock is composed of them. Kent's Cavern, celebrated on account of the remains of elephants, rhinoceroses, hyenas, bears, deer, wolves, &c., found in it, is situated in these limestones."

Similar caverns to Kent's have been discovered in the Plymouth limestones, and the remains of animals of the same description have been found in them. These discoveries of ossiferous caverns have been of considerable interest, as marking a period when those islands must have been the habitation of animals now found only in tropical climes. Notwithstanding the variety of bones found in Kent's cavern, and others, it is inferred from very satisfactory evidence, that the hyena alone inhabited them, and that these predaceous creatures accumulated the bones of the other animals which have been found.

It must be borne in mind, however, that the remains of animals found in these limestone caverns, are of all ages; and Dr. Buckland has shown that it is highly probable that they may have been used as occasional places of sepulture, especially from the evidence afforded by the discovery of the remains of a woman in Paviland Cave, Glamorganshire. We have incidentally noticed these limestone caverns principally to show the geological time to which these formations must be referred. The beautiful *Madrepore* and *Encrinetic* marbles show that they are the result of influences such as those now going on in the Pacific Ocean.

These enormous masses of limestone have been, without doubt, produced by *polypi*.

The best evidence of this has been afforded by Mr. Austen, who examined with very great care not merely the limestones of South Devon, but the rocks immediately associated with them. The limestones are stated by this author to occur, in nearly every instance, in the immediate vicinity of volcanic disturbances, and to be partly included in the slates and sandstones, and partly to rest upon them.

To the former belong the broad band extending from Staple Hill to Dean Prior, the minor bands in the neighbourhood of Thorpestone and Totness, and all those which occur beyond the Dart; also the limestones of Newton and Torbay. They are said to be less pure and more slaty than the overlying limestones, and to be frequently separated by seams of shale. Transverse sections of these bands show, that the strata in some cases become thinner as they descend, and the partings of the shale increase, as near Staverton in the valley of the Dart, and at Staple Hill; but that, in other instances, as between Newton and Totness, the strata, instead of fining off, end abruptly upon the slate, and are covered in the direction of the dip by similar slates. The strata are always inclined, but they invariably form a table land at the surface. This inclined position is conceived not to be due to dislocation, but to the beds having been deposited at the angle which they now present. The bands of limestone dip 40°, but are nowhere more than 150 feet thick, and they all contain the same description of organic remains.

In the structure of the Devonshire limestones, Mr. Austen considers that he has discovered evidences of an origin similar to that of modern coral reefs, which will explain their inclined position. At Ogwell Park the limestone forms a horizontal capping to the inclined strata, and at Bradley rests conformably against a ridge of slate, the baset edge of each bed rising to the level of the crest of the ridge. This structure agrees with that of the coral reefs in the Southern Ocean.

The stratified arrangement of the calcareous masses may be explained by the occasional deposition of sedimentary matter, which might, for a time, interrupt the labours of the *polypus*; and thus a series of beds would be produced, varying in thickness, according to the recurrence, at shorter or longer intervals, of interfering agents, each bed rising successively to the surface-level of the water.

If the deposition of sedimentary matter were great, then the *polypi* would be destroyed, and the reef would become encased in a mechanical accumulation. In further proof of the limestone of Devonshire having been coral reefs, Mr. Austen advances the great abundance of zoophytes found on the surface of the lower strata, embedded in the layers of sand which separate the beds; and, their absence in other parts, especially in the interior of the bands, is no objection to this view of the origin of the limestone, because, in recent reefs, all traces of organic structure are frequently obliterated.

If we refer back to the description quoted from De la Beche, or if we examine for ourselves the rocks *in situ*, we cannot but be struck with the resemblance in the conditions, to those which are constantly occurring in the Atoll of the Maldiva Islands, and the great coral reefs of the Eastern Archipelago. Masses of branching madrepores, then as now, were formed upon the coasts of a red sandstone sea; and alternations in the levels of land and water produced all the conditions of beds.

Mr. Charles Darwin, in his valuable

work on "The Structure and Distribution of Coral Reefs," has explained, with very great accuracy, all the conditions under which coral reefs are now forming in the Pacific Ocean. The conditions are precisely those which will explain all the phenomena of the limestones of Devonshire. Upon the theory that the land around which coral reefs have been formed has been gradually subsiding, and that during the subsidence there has been a constantly upward growth of the reef-constructing corals, this observer explains the progress of coral formation in some cases, and the destruction of the coral animals in others.

He has shown us at what depth the polypifers can exist, and how slight movements destroy them. Not only is the sea active in grinding up the coral rocks, and thus forming deposits, but "the number of the species *Holothuria*, and of the individuals which swarm on every part of these coral reefs, is extraordinarily great; and many ship-loads are annually freighted, as is well known, for China, with the trepan, which is a species of this genus. The amount of coral yearly consumed, and ground down into the finest sand, by these several creatures, and probably by many other kinds, must be immense. These facts are, however, of more importance in another point of view, as showing us that there are living checks to the growth of the coral reef, and that the almost universal law of 'consume and be consumed,' holds good even with the polypifers forming those massive bulwarks which are able to withstand the force of the open ocean."

By these means there was a formation of material which was eventually to receive a stony structure; and if to this condition we add the by no means uncommon one of volcanic action pouring out its molten matter, to produce the all-involving trap rocks, the entire set of phenomena is complete.

Such then are the geographical, geological, and physical condition of the Devonshire limestone, we must now return to the economic value of these stones.

At the Marble Works of Mr. Woodley, at St. Mary Church, near Petit Tor, and Babbacombe may be inspected every variety of these limestones—worked into columns, vases, chimney-pieces, and a variety of other ornamental articles. These marbles are varied tints of grey, mingled with veins of white. Blocks composed almost entirely of fossil corals are frequently found. These are known as Madrepore Marbles. Red and yellow varieties are sometimes found near Babbacombe, but in smaller quantities. In addition to those, the following summary from the "Geological Survey of Devon and Cornwall," shows the variety which may be obtained.

"The marbles of Plymouth are not very dissimilar from those obtained at Petit Tor, with the exception of the black, a good variety of which is found at Cat Down. At Ipplepen, there is a reddish variety, which is extremely handsome; and near Totness, there are some of good appearance; indeed, throughout the limestone between Newton Bushell, Babbacombe, and Plymouth, marbles of very great varieties of colour may be obtained, though tints of grey chiefly prevail, and they deserve to be far more extensively employed than they have hitherto been: a greater demand would cause more varieties to be worked. A beautiful green marble is found in Kitley Park, and the rose-coloured dolomite in the vicinity of the same place, affords a very handsome, though hitherto neglected, material."

R. HUNT.

THE ROYAL PICTURES.

L'ALLEGRO.

W. E. Frost, A.R.A., Painter. T. Garner, Engraver.
Size of the Picture, 3 ft. 2 in. by 2 ft. 4 in.

ETTY seems to have had no small influence on the destiny of Mr. Frost, who is now almost universally considered as the legitimate successor of the former in his especial walk of Art, while it was by his advice that the painter of "L'Allegro" was placed in the school of Mr. Sass. In 1829, he was admitted a student of the Royal Academy, where, by his assiduity in availing himself of the means afforded for study, he made such progress as to secure the several medals and honorary distinctions awarded by that institution. As is the case with many other artists who ultimately aspire to historical painting, he commenced his career as a portrait painter, and during the fourteen years that followed, he painted upwards of three hundred portraits. But this field was too restricted for his genius, and as an early step towards emancipating himself from the drudgery of portraiture, if the term may be applied to the art, he sent to the Exhibition of the Royal Academy, in 1843, a picture, "Christ crowned with thorns," which met with a purchaser, and at once determined him in his future path; portraiture was abandoned.

In 1844, one of the prizes was awarded to his picture of "Una alarmed by Fauns," in the Westminster Hall Exhibition; and in 1846, Mr. Frost was elected an Associate of the Academy.

The picture of "L'Allegro," in the Royal Collection at Osborne, is copied from a portion of a larger work, entitled "Euphrosyne," painted to illustrate Milton's poem; but it has especial reference to the passage,—

"But come, thou goddess, fair and free,
In heaven ye've d' Euphrosyne,
And by men, heart-easing Mirth,
Whom lovely Venus at a birth,
With two sister Graces more,
To ivy-crowned Bacchus bore."

The picture "Euphrosyne" was painted, in 1848, for the well-known patron of English artists, Mr. E. Bicknell, in lieu of the "Una," which Her Majesty desired to possess after it had been purchased by that gentleman, and which, of course he relinquished. Her Majesty was also so much pleased with the "Euphrosyne," that she commissioned the artist to paint the passage here engraved.

From the outset of his career, Mr. Frost inclined to subjects of a sylvan character, illustrating themes such as are found in Spenser or Milton, where the grace and loveliness of the female form might be represented in pure harmony with the varied charms of natural landscape; and his indefatigable study of the human figure enables him to illustrate these great authors with surpassing ability. No painter of any epoch has treated the semi-nude with more delicacy; had his prototype, friend, and adviser always evinced the same feeling, how much more acceptable would the generality of his pictures prove to the public. Always correct, Mr. Frost is never over-free; the fervour and purity of his own refined intelligence and character suggest and influence all the productions of his graceful yet vigorous pencil, while it is impossible to praise too highly the exquisite care with which every part of his composition is made out.

"L'Allegro" is one of the "birthday presents" of the Queen to her Royal Consort. The picture is, in a remarkable degree, distinguished for those admirable qualities which give the works of the artist such superiority over those of any other living painter who professes to follow the same style: the figures are charmingly grouped, and are in most hilarious motion; they are drawn with perfect accuracy, and their faces, bright with "wreathed smiles," would charm even an anchorite, soul-steeled as he may be against the vanities of the world. In colour the work is marvellously lighted up, and the flesh is so exquisitely and truthfully painted, it seems as if it would yield to the softest touch.

A FEW WORDS ON BEAUTY.

Present—MAGISTER and AMICUS.

micus.—BEAUTY, you say, is the legitimate subject for Art—would you, then, limit Art to the expression of the agreeable only? Would it not thus be deprived of many fine subjects, and often of the opportunity of inculcating a moral lesson?

Magister.—At least, the more beauty there is in a subject, the more it is suitable for Art. Subjects incapable of beauty are unfitted for representation.

Amicus.—To take a favourite subject with the painters of the middle ages—"The Fall of the Wicked"—

"hurled,
With hideous ruin and combustion, down
To bottomless perdition."

how would you rank this subject?

Magister.—Pictures of pure horror are certainly not suited to our tastes at present. The "Murder of the Innocents" appears to me the most detestable subject of mediæval art, more especially as frequently represented in the most actual manner. The subject you instanced is more mythic; mysterious and removed from actual life, and thus less atrociously abhorrent. Its nature is more epic—and when presented to us as it has been by Michael Angelo and Rubens, it possesses so much beauty of composition, form, and colour, that it may be said to be dragged into the category of the beautiful.

Amicus.—But what is the principal impression derived from it? Is it that of beauty?

Magister.—Perhaps not. But each work of Art may be said to be two-fold in its nature. In the first place, there is the subject—the story told—the mental aim. In the case you mention, there is the "doom of evil" presented—a moral lesson. This may be called its theoretic quality, which speaks straight to the intellect. Secondly, there is that which addresses itself more sensually—that is—enlists in its favour those messenger senses of sight which convey it to the mind, and speaks to their predilections for graceful flowing compositions, and the charms of line, tone, and colour.

Amicus.—May you not add a third quality as intermediate, so to speak, existing between and uniting these—viz., that represented by the ingenuities of the modes selected by the artist in adapting the subject to the powers and expression of his art, such as groups, actions, episodes, chosen by him, that speak, not by words but by visible images? Thus, firstly, we should have the mental story to be told; secondly, the artistic view of the subject that has adapted it to the arts of visible expression; and thirdly, the modes and felicities of execution, by which all this has been carried out.

Magister.—I was going to say that beauty in execution would go far towards rendering any subject suitable for Art; but I readily accept your third division, and, apropos of it, would add that there is nothing in which the capacity of an artist is more shown than in the mode by which he adjusts a given subject to the powers of his own art. Thus you have set the proposition on a Delphic tripod.

Amicus.—Truly a three-legged stool will adapt itself to any uncertainties of ground, and the reason, perhaps, that ancient priestcraft adopted it. So ours, perhaps, may stand, until some one seeks to add a fourth or fifth leg to our definition:—for in these kind of disquisitions the last speaker is uppermost, like the child's game of "hand over hand," and the edifice that looks very stable for the moment requires but a stone loose for it to be easily pulled down into ruins by another speculator, to form materials for a fresh structure, possibly equally short-lived.

Magister.—But such disquisitions may be occasionally useful not only as gymnastics for the mind—to exercise its powers, and make firm its muscles, but particularly as regards the aim and means of Art.

Amicus.—No doubt;—and if conducted in a proper spirit, they also read us a good lesson,

W. E. FROST, A.R.A. PINX^t

T. GARNER SCULPT

L' ALLEGRO.

FROM THE PICTURE IN THE ROYAL COLLECTION.

LONDON, PUBLISHED FOR THE PROPRIETORS.

by illustrating the bounds, beyond which we cannot soar. I recollect an account of some pigeons which were taken up by an aeronaut and let out when his balloon was at its highest. The poor things seemed quite lost. They waved their wings very vigorously, but the air was too thin for them, and it was with much ado that they got back to the car from which they started. Thus it is, not unfrequently with your metaphysical gentlemen. From the very high starting point they take, they get at once into an ether too subtle for their pinions, and they flap round and round without making any progress. Doubtless, your metaphysical requires a still stronger curb than even your poetical Pegasus.

Magister.—As simile second, such a would-be grasper at the "nature of things" may be likened to an insect, which, having always lived on one leaf, would vainly reason proudly on the whole tree, or the wood in which it stands.

Amicus.—There are no doubt very high things which can be and have been, truly, as far as we can judge, compassed and expressed by mathematical rules. For example,—what can be more lofty or ennobling than the knowledge—to which science and the successively piled labours of great minds have enabled us to creep—of the times, orbits, sizes, and distances of the heavenly bodies. But as to the "essential nature of things," we do not seem much farther advanced than at the time of the wise men of Greece.

Magister.—For instance, we were speaking of Beauty in regard to works of Art. Beauty is always attractive, in whatever way it be manifested. It is an object of our involuntary as well as voluntary regard; and yet we can't define it. I fully believe, except in a general way. 'Tis a part of the "to kalon" that baffled the ancient philosophers.

Amicus.—Yes!—the search after such abstractions reminds me of the pursuit which they say Swedenborg used to make about his room, with two hair-brushes, after the spirits which he deemed were ever hovering around him! We cannot catch an abstract essence as an entomologist does a beetle or a butterfly, and pin it down and look at it through a microscope!—Some Persian poet calls Beauty the perfume of the soul, and there it must rest.

Magister.—Some have thought to define it as the result of the union of fitness and proportion; but, as regards form, comparative anatomy alone were perhaps sufficient to show the inadequacy of such definition. Have you paid any attention to this last subject?

Amicus.—A little—that is—as regards general principles.

Magister.—You know one of those is, that there is a general connection and unity of plan in all animal bodies, which is especially evident in the higher and more developed classes. Especially as regards what our friend the professor would call the "osseous structure;" and that if you set up the skeleton of a horse or a lion on his hind feet beside that of a man, you find nearly all the principal details of the beast identical with that of the man, as the hock with the heel, the stifle joint with the knee, and the knee with the wrist, &c.

Amicus.—Yes, I recollect attending a lecture of Mr. Haydon, in which these resemblances were clearly pointed out.

Magister.—And this does not stop with the quadrupeds, but ascends to the birds, in which the wing represents the arm, and nearly all the muscles of the part of the body to which it is attached are devoted to moving it. Now, an angel has ever been considered a beautiful object in Art. The Egyptian, Hebrew, Assyrian, Phœnician, Greek, Roman, and in the latter days, our most tasteful artists, such as Raphael and Flaxman, have delighted to represent such beings. But how is the human structure to receive and accommodate arms and wings both, which are representatives of each other? Where is the room for their attachment, and for that of the muscles to move them? And could they be so attached, would not they be very much in each other's way? So much for the fitness of an object of Art which has universally been acknowledged to be beautiful. Again, I think Pliny affords an account of a Greek picture, very

celebrated and much admired, of a family circle of Centaurs, father and mother, all at home with their little foals, and yet these represented creatures with two sets of internal vital organs.

Amicus.—To accommodate which they may have dined alternately off roast meat and oats. May be, on the occasion when they met the Lapithæ, at the marriage of Hippodamia, they had lunched previously with the steeds in the stable before completing their repast with their masters upstairs; and this disagreement of words, in accordance with what some one has said as to all great dissensions being traceable to errors of digestion, may have had some part in the notable row that was got up on that occasion.

Magister.—Which afforded so favourite a subject to the artists of old. However, after all that may be said in the way of ridiculing too keen a search after precise definition, some advantages are derivable from their discussion. Many a useful discovery emanated originally from astrology and the search after the philosopher's stone; and fitness, though useless as a definition, may be, and is doubtless excellent as a quality in a work of art.

Amicus.—Especially if we give it the less pedantic name of common sense, although indeed it might be rather difficult to argue all the fine things even into that category. Unless, indeed, common sense is to be taken with a dramatic or operatic interpretation, which allows of a large licence; but even then I fear it were impossible. I am a great admirer of Milton. Trite enough! you will say; but perhaps not so much so, when I add that I am one of the very few who really have read *Paradise Lost* through, from beginning to end, every word. Moreover, I am ever reading it between whiles; but I must allow with Johnson, that I cannot away with the battle of the angels, or the gunpowder bombardment of heaven.

Magister.—Which, after all, was only a copy of Hesiod's War of the Giants and Titans.

Amicus.—That he copies too, if you recollect, separately, in the second day of the fight; that is, the Pelion-upon-Ossa part of the affair. But, doubtless, the old poet had the best of it. There was at least a dramatic fitness in making volcanoes war with heaven and belch forth rocks and flames in the face of celestial spirits; but "villanous saltpetre" should not have been introduced into angelic fight, however much Milton may have desired to express his detestation of that agent of war. The whole struggle of spirit and matter in that great poem was an unexampled difficulty to treat; but, with this exception, the great poet throws his whole authority on the side of propriety. How fitting are all the more mortal details which really could be grasped! How characteristic the representation of our first parents and the world of turbulent thoughts out of which his Satan is created! In all he could compass, every episode and thought and description was suitable for its purpose, and it was only in those parts of this subject that are beyond all mortal power that consistency is occasionally left behind. Therefore, taken as a whole, his work adds strength to the authority for common sense in Art of the highest class.

Magister.—Those who have made fitness the father, have made proportion the mother of Beauty. But they would have to allow very protean qualities to that mother. For what two beautiful objects in nature present the same? Do the lily and the rose?—or the deer and the leopard?

Amicus.—But, in the human race, do you or not think that Beauty, as far as form goes, can be brought down to any defined ratio?

Magister.—At least it would have to vary with age, sex, and character, and it would be quite vain in the practice of Art to attempt to apply one common ratio to the forms of men, women, and infancy, or to varieties of character. Nor do I think any practically useful, except a few general ones—such as those set forth by Da Vinci or Flaxman, not according to any abstract system, but from the measurements of fine nature and of the ancient statues. Beyond this they trammel Art rather than assist her, and tend to produce what the French call *chic*.

Amicus.—Which is?

Magister.—A sort of conventionalism at variance with nature, giving to works the appearance of having been done by receipt.

Amicus.—I have, nevertheless, seen some very elaborate and ingenious theories and diagrams applied to forms of recognised beauty, such as the Portland Vase, the Medicean Venus, and the Façade of the Parthenon; and there were really some remarkable results shown, certainly rather intricate and difficult to follow, but still fascinating, and having a show at least of reason. Would you regard all these labours as mere *nugæ difficiles*, and set them down as of no service whatever to Art?

Magister.—Not so—I consider Art and the professors of it much indebted to all persons who will carefully and heartily give their own views of it. It does good to Art agitating such questions, if only by bringing it before the public in various points of view; but even farther than this I am by no means inclined to deny that a good thought, even as regards practical usefulness, may occasionally be struck out by such means. But as a system on which to rest or depend, I consider such geometric schemes of beauty as illusory. I have seen some of these theories to which you allude, and I especially remember one system of beauty founded upon the proportions of the Venus de Medicis, illustrated by a vast number of lines and proportions running hither and thither all over her like a web, proposing to illustrate the science on which she was formed, and to give the key to the reproduction of such beauty in Art generally. Now, even granting that she combines all that is most beautiful in female form (which I am heretic enough to be very far from), I do not believe that she was either executed by such a process, or that the student would be advantaged by such, even in copying her. As to her original creation by such means, I believe her author, could he return to the world of Art, would be as much astounded by the theory attributed to him as Shakespeare would by many latent meanings fastened on him by his commentators. As far as Art is concerned, antiquity never walked up to her creations of beauty on the legs of a pair of compasses!

Amicus.—Sir Francis Bacon seems to have been of the same mind, when he says—"Though a painter may make a better face than ever was, that he must do it by a kind of felicity (as a musician that maketh an excellent air in music) and not by rule: a man," he adds, "shall see faces, that if you examine them part by part, you shall find never a good, and yet all together do well."

Magister.—Exactly. That is, we are to look for Beauty more in the harmony of details than in the individual beauty of parts considered by themselves.

Amicus.—By which means she produces so much the more variety, inasmuch as the number of tunes in music exceed that of notes. For my part, I do not admire scholastic restrictions that prescribe certain regulations to Beauty, as such and such features and colours in every case. I believe in a *retroussée* nose as well as in a Grecian one, and in red hair as well as black, or brown, or golden.

Magister.—With certain reservations, of course. However, the great master of the "Novum Organum," in the words you have just repeated, illustrates my views on this subject pretty closely. I believe, indeed, that beauty in Art arises more from a certain inspiration of harmony than from any set or definable proportion of lines or features, and that in such creations as hers, form, colours, and arrangement come into the artist's mind, like the verse and rhymes of the poet, at one birth. In nature, to which every artist looks for precept and example, how thoroughly is this harmony borne witness to! How much, as a whole, is a plant in harmony with itself in its least details, even to its smallest anther or leaflet! Nature seems never to make a mistake. Each part belongs to the others, and to change one would be like striking a false note.

Amicus.—It has been said, however, that the "Great Mother" works by mathematics.

Magister.—She may. We see she *does* in many

respects, and the principle of all her manifestations may be guided by these in her inmost laboratory. But we began by agreeing that we could not arrive at the *essence* of things, and that they are only *effects* we are able to reach, even when we call them *causes*. If she creates beauties by mathematics, it is in a mode we do not understand, and surely if geometry takes such part in our creations in art, it is in a latent way, as in the other provinces of nature,—the artist's mind being but an unknowing agent—as much a part of nature as any other. There are, however, doubtless, some departments of Art in which the direct use of the rule and compass, and other mechanical aids are highly essential and useful, but truly as a nurse, not a parent—as a staff, and not an index. Thus it is in architecture, and in all that extensive field of ornament which rightly belongs to its province, and wherein conventional forms and diapers, &c., are required in repetition for the decoration of surfaces. But as regards Art in general, the more intelligent, imaginative, and vital the subject, the less way on the road to it will mechanical aids accompany and assist the aspirant. No Art can thoroughly comprehend and take in but one phase of nature.

Amicus.—Except, perhaps, the dramatic, in which man himself, in his mind, person, speech, and action, is his own brushes, paint, and canvas.

Magister.—But even that "mirror held up to nature" has but one side, and no representation requires a greater amount of allowances to be made than that of the Drama. It may be wider in its range than other Arts, but the very condensation it requires is one cause of its necessary incompleteness. Its shortcomings may be different from those of other Arts, but they exist to an equal extent. But to return to the Arts of Painting and Sculpture. It were trite to repeat that each has, as it were, but one phase of nature for its province, in which we can work profitably only according to the lights that are given us, and not according to those we fancy for ourselves; and yet the artist has not a clear view of his occupation if he has not this truth before him. The creature cannot comprehend the Creator, or His mode of creation, and it is only here and there that we are permitted to peep through a gap, as it were, to see some of the principles of the wonderful machine. Nature is but one, and the whole theory of growth and existence may be pervaded and controlled by certain geometric and arithmetic proportions—as the great events and recurrences of Astronomy, but assuredly we cannot find them out. We certainly cannot find fixed ratios and regularities everywhere; on the contrary, irregularity (perhaps from our own limited powers) meets us on every side full as much as regularity. These two qualities, indeed, as far as we are able to see, are most intimately associated in nature's works—almost, one might say, in alternate stages. What regularity of structure, of fibres, and filaments, in a leaf or a flower—and yet what endless variety and irregularity exists in their distribution in a forest or a meadow! The general shape of the globe, a sphere modified by rotation, how exact its law of form—and yet how irregular the arrangement and indentation of the seas and continents, and fortuitous to our comprehension the directions of the great chains of mountains that stretch across its surface. Pursuing this to a still wider range, how geometric are the motions of the planets which form our immediate system; and yet, how without the vestige of a regular plan that our comprehension can fathom lie in the depths of space the vast drifts of innumerable worlds that we perceive in the form of stars and nebulous masses. And "*parva componere magnis*," inasmuch as this analogy may bear upon Art, it illustrates that Beauty is not to be sought for wholly in regularity, but also in a varied and subtle inspiration not to be bound by rule; and that she is not to be extracted, as some would have it, arithmetically, like a cube root! I believe that the triumphs of Art were never reached except with the assistance of a sort of "divine afflatus," which, however, never came but to the sincere, devoted, and ardent student. And that it was not till after their completion, and not in the process of their creation, that they were connected with any strict system of geometric proportion. They

were done and admired, and it was not till afterwards, and when they had gained a steadfast niche in the temple of Fame, that they were found to possess—if they do possess—one or more ratios of arithmetic proportions. But to the idea that they were originated by such means, beyond a few simple mechanical aids obeying, but not guiding the dictates of genius, I give no credence whatever.

Amicus.—I trust to your practical knowledge. But we have been talking of the planets: what think you of the "conic sections" in which they revolve, as exponents of lines of beauty? might they not be as illustrative as those chosen by Hogarth, or others?

Magister.—Something of this has been suggested—I think, at least, as regards ellipses—showing that most graceful forms arise from their combinations.

Amicus.—The parabolic curves are of most exquisite character, and the cone, cut spirally, also would afford, I can fancy, innumerable "lines of beauty."

Magister.—But these last would not be simple conic sections.

Amicus.—So much the better; you say we are not to put Beauty into too close trammels.

Magister.—But the simple sections themselves, with their combinations, are doubtless capable of a vast variety, and I can well imagine an interesting comparison being made of the most remarkable contours of beauty with those mysterious curves that guide the wondrous denizens of heaven,—that starry host—

"Ever singing as they shine,
The hand that made us is divine." *

RATIONAL ENTERTAINMENTS,

A SOIRÉE AT THE PAVILION AT BRIGHTON.

THE Brighton and Sussex Society of Arts had a *soirée* a short time since at the Pavilion. I will give a short description of this *réunion* while the impression is fresh on my mind. I must first, however, relate briefly the history of the Pavilion after it was abandoned as a royal residence by our sovereign.

The reader may perhaps recollect that an Act of Parliament was obtained for the sale of the crown property at Brighton, and that in 1850, after much consideration, the inhabitants purchased the estate for £50,000. This large outlay was afterwards increased by the necessary expenses and improvements to £70,000. The wisdom of the arrangement has been proved by the event. The improvements and alterations have rendered the estate nearly self-supporting, and a portion of the debt (£10,000) has been paid off, while the annual rate for the Pavilion has not exceeded threepence in the pound in each year. The pleasure grounds, instead of being covered with buildings, are permanently thrown open to the public, and an open space, which serves as the lungs of the town, is secured in its very centre. Many of the offices and adjacent buildings have been removed; on the land, which was let advantageously on building leases, a fine row of houses with shops has been erected; the walls around the grounds have been replaced by iron rails, which permit a view of the pleasure grounds and the Pavilion from the street. The suite of state rooms, five in number, which had been dismantled of their furniture, and even of their stoves and chimney-pieces, have been repaired and re-decorated as nearly as possible in their original style, and are used as assembly rooms for balls and concerts. They were opened for the first time under the new ownership on the 21st of January, 1851, on the occasion of a grand ball, which was attended by about 800 persons.

Of all the entertainments, however, of which this suite of rooms has been the theatre, there are few which have afforded more pleasing and rational amusement than the *conversazioni* which have been given by the Literary and

Scientific Institution, and the Brighton Fine-Art Institute or Society of Arts, whichever may be its appropriate designation.

The last-mentioned society has established an exhibition of paintings by living artists.* Upon the occasion referred to, the exhibition room, formerly the palace kitchen, was lighted from the centre by gas, and thrown open to the visitors. As it is not my purpose to describe the exhibition, I shall merely observe that there were nearly 80 exhibitors, many of whom are local artists. Among the London exhibitors are Carl Haag, Lear, Gastineau, A. Fripp, Mrs. Olliver, Fanny Corboux, Bartholomew, Stephanoff, Rivière, Raven, Hine, Tidy, Barraud, &c. In an adjoining apartment were several portfolios, containing drawings by local artists, and Talbot-type views. There were also pictures lent by gentlemen residing in the town. Mr. T. S. Robins presided over this department. The banquetting-room was temporarily fitted up as a concert-room. Here the "town band," conducted by Mr. Onry, played at intervals during the evening, the entertainments being varied by the performance of Sig. Bianchi on the pianoforte, and of Herr Zerom on a new instrument called the "Emmilynka."

The yellow drawing-room, the next of the suite, and, in its decorations, perhaps the most tasteful of the whole, was devoted to works of Art, lent by gentlemen and tradesmen of the town; and, in my opinion, this was one of the most pleasing features of the evening. There was here no distinction of ranks, but all classes vied in administering to the entertainment of the company. Among the articles of taste exhibited were the Plymouth race cup in silver, presented by the Queen; the Warwick race plate, with the legend of Earl Grey, both won by Rataplan, the latter was exhibited by Capt. Thelluson; a beautiful nautilus cup of the fifteenth century, set in gold, and two oriental pearls worked, by the addition of gold, into the forms of a bear and a bird; a French bronze, representing Louis IV. surrounded by the virtues. These were contributed by Mr. Lewis, the jeweller. Mr. Ellis sent statuettes and bronzes. Mr. Bright, the jeweller, contributed several electretypes and imitation bronzes by Méné, Clavier, Robert, and Marin; a very fine and curious antique French bronze of the 15th century; copies of Roman tazze, &c. Mr. Martin, of East Street, and Mr. Crunden, of the New Road, upholsterers, contributed several curious and ornamental articles of furniture, among which were a carved oak cabinet; a splendid cabinet of the time of Louis XV., in ebony, ivory, and gold; and a table of Florentine mosaic. Mr. Dmcombe exhibited another cabinet, the open doors of which displayed specimens of old Chelsea and other china; and an antique brass watch, almost as thick as a turnip, of the date of 1660. Besides these there were carved cups of rhinoceros horn, statuettes in Parian, the latter exhibited by Mr. Hawkins, the china-man; busts sent from the studio of Mr. Pepper and his son; pictures arranged on easels; books of prints; and a very interesting collection of lithograph fac-similes of autographs of distinguished persons, each specimen headed by a portrait or vignette view connected with the author. I do not profess to enumerate nearly all the curiosities and objects of Art exhibited this evening, but merely to give a general idea of them; and I have mentioned the names of some of the exhibitors in order to show to what class of persons the visitors were indebted for their entertainment.

The rooms were opened, and the company began to arrive at the early hour of seven, and at nine tea and coffee were served in the central drawing-room.

But it is time to speak of the guests, and this is the pleasantest part of a very pleasant subject. With the exception of a small sprinkling of the higher classes, the company was composed almost entirely of professional men and their families, and tradesmen with their families. The price of admission was half-a-crown, and all who desired it, and who had any claim to respecta-

* To be continued.

* The present exhibition is the fourth which has taken place in Brighton.

bility, were admitted by tickets. Everybody seemed determined to be pleased, and everybody was pleased; good humour and good manners prevailed everywhere. No party feeling, no misplaced pride of station or wealth was suffered to intercept the general harmony, for those who feared contamination from the mixture of guests absented themselves; all went merry as a marriage bell, and an expression of tranquil enjoyment lighted up all faces.

But the ladies, the reader may enquire,—how were the ladies dressed? Generally speaking, with great good taste; in evening costume, but with perfect decency, by which is meant, be it understood, that they were not *décolletées*. The great size and coldness of the apartments rendered those very graceful articles of dress called opera cloaks almost universal, and their varied colours and slight diversity of form, their graceful and flowing lines, added considerably to the picturesque character of the groups.

About ten o'clock the company began to retire, and the rooms were cleared at an early hour, and thus closed one of the most agreeable *réunions* to which I was ever a party. The arrangements for the accommodation of the guests were perfect, and great credit is due on this account to the committee of management and the secretary, Mr. Edmund Scott. There was no confusion of any kind. The police, as usual on such occasions, superintended the arrival and departure of the carriages in which the company came and left.

The number of guests was about 300, not nearly so many as those who on previous occasions had assembled at the *conversazioni* given by the Brighton Literary and Scientific Institution. Had the weather, which was extremely wet, been more favourable, the attendance would probably have been much more numerous.*

And now, it may be asked, what is the use of describing this evening's entertainment? I will explain. My object in doing so was two-fold; first, to show how easily and cheaply a most pleasant and rational evening's amusement may be obtained, where all are willing to contribute their quota to the general enjoyment; and secondly, because the *soirée* I have described was a delightful instance of the amalgamation of ranks, a happy oblivion of the barriers placed by an artificial state of society between the different classes of which it is composed. From such *réunions* we may anticipate the happiest effects. Learning and science recognise none of these distinctions; all their followers are fellow students, the only honours are those awarded to the most competent. In our recreations, on the contrary, our most exclusive and aristocratic notions break forth. We consent to pay double at a concert, in order to separate our own persons from the chance of contact with those who cannot afford to pay so much. Where the party excluded does not know how to behave in genteel society, the exclusion is proper and justifiable; but, it may well be asked, how are people to learn to behave if they are not admitted into the society of those who behave well? The great extension of education has led to a corresponding improvement in all ranks; cultivation refines our minds, but our manners must be polished by mixing with good society. The manners of the different ranks always take a tone from those above them, hence the obvious method of raising the general tone of society would be to afford opportunities, like those offered by the *soirées* at the Pavilion, for the occasional meeting, on equal terms, of different grades of society. At present every rank has its peculiar enjoyments; the pleasures of the educated classes are more refined than those of the uncultivated. Those who cannot appreciate mental enjoyments seek delight in sensual gratifications; in one point they are unanimous, namely, the necessity of recreation. The proverb says—"all work and no play makes Jack a dull boy." It is not sufficient to educate the multitude, they must also be amused and entertained; the mind must have relaxation,

and will seek for it in the gin-palace and the beer-shop, if a taste for enjoyments of a higher class be not infused and cultivated. It has often been observed that women have a peculiar facility in acquiring the manners of those above them. This suggests one means of improving the habits and refining the enjoyments of the lower classes; yet, it is one which has been but too much neglected. Although men of different ranks, when thrown accidentally into each other's company, readily mix in conversation; with the other sex it is quite different. Women not only shun those whom they consider as of inferior rank, but their fathers, husbands, and brothers constantly enforce this distinction.

Let it not be supposed that I am advocating either what is called low company or communism; my object in promoting an *occasional* intermixture of the different ranks is, not to degrade the more elevated by reducing them to the level of those beneath them in intelligence and station, but to raise the lower classes by giving them opportunities of cultivating the tastes and sharing the more refined enjoyments of the higher ranks. It strikes me that this may be done effectively through the women. Give them occasionally the opportunities of mixing, as in the *soirées* before mentioned, with those of superior rank, upon equal terms, and they will take a tone from the society to which they are introduced. Let the terms of admission be inexpensive, and the only requisites respectability of character and suitable dress, and I have little doubt that in a few years, it will be found that the wives and daughters of the higher classes of mechanics will attend these meetings without exciting observations by the coarseness or peculiarity of their manners. With the characteristic quickness of their sex, they will perceive their own shortcomings in these points, and will study to attain the easy and elegant manners of the more refined classes. They will succeed, and will carry these refinements into the modest home of the mechanic and the artisan. This is the little portion of heaven which shall leaven the whole lump.

Great efforts have now been made for many years to educate the lower classes. Mechanics' Institutes are numerous all over the kingdom. These have ever in view the mental cultivation and improvement of men, while they entirely overlook that of the females of their families. Now, although I would not on any account that women should *habitually* seek their enjoyments and recreations from home, yet they ought to participate in the advantages which the men of their family enjoy. If they cannot go to the Institute to read, why should not the wife or daughter of a member, for a smaller subscription, have the privilege of reading books from the library at home? But above all, why should there not be periodical meetings at Mechanics' Institutes of the same nature as those at the Pavilion, to which members might bring their wives and daughters, and to which a tone might be given by the presence of persons of superior rank who feel an interest in the improvement of their countrymen? Exhibitions similar to those described in this paper are not so difficult to get up as some persons might imagine; some articles of taste would doubtless be lent by gentlemen; many would be supplied by the mechanics themselves. It must be recollected that although their masters furnish the materials, and perhaps the designs, that *they*, the mechanics, are in many cases the actual producers of the articles to which the master's name is attached. Many of these mechanics are engaged on works requiring taste or skill, or ingenuity, and which might be worthy of a place in such exhibitions, rendered doubly interesting by the display of the works of the members. There are also many tasteful branches of female employment which might properly obtain a place in this evening exhibition; among these may be enumerated, artificial flowers in wax, paper, and cambric, and fancy work of various kinds. Variety may be given to the entertainment by the introduction of music. But at first the task of suggesting and arranging the amusements would devolve upon those whose station in life has rendered them more familiar with the requirements of their guests,

and whose presence, while it promotes the real enjoyments of the meeting, operates as a restraint upon persons who might not be disposed to pay attention to the rules and regulations laid down by their equals, though for their own benefit.

One feature of these *réunions*, I must not omit to notice, namely, that notwithstanding the miscellaneous character and castes of the visitors, there is no more actual mixture than that which takes place upon the public esplanade, or in a fashionable church filled up with benches instead of pews. The various groups are essentially family groups, and, as such, remain undivided all the evening. The young, therefore, incur no risk of introductions to persons of whom their parents would not approve. And this leads me to observe that dancing, which necessarily separates the child from the arm of the parent, and not unfrequently from their sight, is systematically and very properly excluded from these *soirées*.

I must conclude by expressing a hope that my readers will not deem the apparently trivial subject of amusements beneath their notice; but that they will consider them as among the most efficient aids to civilisation and refinement; and as such will promote, as far as they are able, all rational entertainments, especially those which tend to elevate and refine the labouring classes, and to promote harmony and goodwill among all the grades of society.

M. M.

THE ART-PUBLICATIONS OF MM. GOUPIL, OF PARIS.

Too long a period has elapsed since we directed the attention of our readers to the high class engravings issued on the Continent; yet they have been exercising considerable influence, not only among the people for whom they are more especially published, but in England, where a very large number of foreign works circulate, and where they are undoubtedly, for the most part, productive of great good. We refer, not so much to the number of coloured lithographs, which find their way into all quarters, because of the small cost at which they are sold, as to that higher order of works, of which our issues in this country are few and far between; yet even of the former we may speak with respect, for they teach while they give pleasure: and it is sufficiently notorious that in the particular class to which we more immediately allude, our English artists are deficient: or at all events they abstain from sending forth to the world those "studies" of form and feature for which we are indebted to our neighbours of France. Our observations, however, mainly apply to those engravings of the higher order of Art—line engravings—which of late years very rarely appear as the issues of English houses: and our supply of which, now-a-days, chiefly comes to us from the Continent. Engraving in line seems, in truth, to have been for some time declining in this country; from the labour, and consequent expense, necessary to produce a line engraving, it is rarely that as a speculation a work of that class is found to answer: at present, we believe, there are not a dozen works of this order in progress throughout England, excepting those of small size, which appear monthly in "The Royal Gallery," and in the *Art-Journal*. But for these indeed, and the engravings in "The Vernon Gallery," British line engravers would have been, during the last ten or twelve years, entirely without employment, excepting the very few who may be styled the heads of the profession.

Under such circumstances, it is not to be wondered at that we resort to the continent for our supply; and it is certain that the establishment under notice gives us that supply in the largest proportion, and of the greatest merit. During a recent visit to Paris, one of our principal enjoyments was derived from a visit to this renowned house; and it is that to which, at present, we propose to direct the attention of

* Before this can appear, a second *soirée*, given by the same society, under the patronage of the Duke of Richmond, will have taken place at the Pavilion.

our readers. The house of MM. Goupil was founded in 1827; it has now a branch at Berlin, and another at New York; and its "correspondence" extends over every kingdom and state in the old and the new world; in America especially they may be said to have introduced Art, for, previously, the importation of prints was very confined, and its native produce little or nothing; a taste for Art has so largely grown "by what it feeds on," that now the United States rank among the best encouragers of fine Art, and its wealthy citizens are the most liberal buyers of first class proofs. This advantage is naturally participated in by England; but it is undoubtedly the consequence of the exertions of MM. Goupil. Some idea may be formed on this head from the fact that, according to M. Goupil's report, the sales they effected there in 1848, amounted in value to 140,000 francs; in 1854 it had reached the very large sum of 569,000 francs.

A sum of nearly 100,000*l.* is annually expended by this house in the production of engravings, and MM. Goupil give employment to all the best engravers of France; attracting also to their establishment many of the leading artists of the other continental states; while a natural prominence is given to the works of the French school of painting, their catalogue includes engravings from the most famous productions of the ancient masters—Raphael, Michael Angelo, Titian, Murillo, Paul Veronese, &c. &c.

To examine, in anything like detail, their catalogue of published engravings, would be to occupy a part instead of a page of this journal. That catalogue is a large book, containing the names of several thousand prints, a great proportion being of the cheap order, but very many of them holding rank among the highest achievements of the age in Art; and, indeed, maintaining a just claim to be placed at the head of those productions of the burin, which extend the fame, give currency to the genius, and circulate the teachings, of the painter.

A few of the works of this order we propose to bring under the notice of our readers. First is that famous print "The Hemicycle," of the Palais des Beaux Arts,—the great master work of the great artist, Paul de la Roche; engraved by a worthy associate, Henriquel Dupont. The picture is almost as well known in England as in France, for it is one of the lions of Paris, which no Englishman ever fails to visit. To describe it is needless; the accomplished engraver has made it common property; for all its worth excepting colour, is conveyed by the burin; and, although of large size, it is issued at so comparatively small a price as to be within the reach of ordinary purchasers.

The list of M. Goupil contains a very large number of works after Paul de la Roche; they are in various styles—all extending the renown of the great painter, and bringing to his *atelier* the homage of those who love and appreciate the excellent in Art of every country of the world; his illustrations of History are familiar: "Stafford going to Execution;" "Charles the First in the Guard-house;" "The Children in the Tower;" and other passages from our English historians, have long been the favourites of our drawing-rooms: while holier thoughts and loftier inspirations are excited by the "Saint Amelie," the "Virgin Mother," and "The Entombment," and the best of our home sympathies are moved by that exquisitely touching composition "Les Joies d'une Mère," and others of its beautiful class: portrait-history being, as it were, consecrated by such works as those of "Napoleon Crossing the Alps," and "Napoleon at Fontenbleau." These grand prints, upon which we cannot find space to enlarge, bear the names of Dupont, Martinet, Mereury, François and Forster, as engravers.

The paintings of Scheffer have naturally been largely multiplied by MM. Goupil; perhaps no living master has so much influenced the heart as this true master; his "Christus Consolator," engraved by Henriquel Dupont, is the cherished guest of many English homes; its companion, the "Christus Remu-

nerator," (engraved by Blanchard) is only its second in public favour; while such works as "The Holy Women at the Tomb," convey the lessons of Art as pure and holy missionaries of Christianity. For giving these admirable and very beautiful productions to the world, the public incurs a debt to the publisher scarcely less than that they owe to the artist.

These are not the only great artists of the French school, whose loftier imaginative works MM. Goupil have multiplied; although these famous painters have obtained a popularity in England which very few of our own artists have achieved; their popularity indeed argues well for our own advanced and improved taste; the circulation of such publications cannot be too wide: it may, in a degree, humble us, in our own self-esteem, when we call to mind the enormous sums lavished in this country—idly or worse—upon multiplications of dogs and horses. But there is, happily, an ample "public" for a better order of things; and we cannot doubt that, if our publishers would dare the higher aspirations of Art, they would "find their account" in them—and not allow the publishers of France to obtain all the glories that are to be derived from the pure and true Art.

It is not to be supposed, however, that MM. Goupil have not ministered to the taste of the multitude in their publications. To say nothing of the thousands of coloured prints, prints in mezzotint, in aquatinta, and in lithography;—comprising war-scenes, fair faces, landscapes, seascapes, costumes, foreign incidents and characters; objects of Art, industry, portraits of great men (dead and living), flower-pieces, studies of ornament, pictures of famous cities; in short, every topic that can be made available by Art to impart pleasure or to convey knowledge, has found a circulation to all classes through the means of these eminent and extensive publishers. And in thus endeavouring to make their works and themselves even better known than they are in England we discharge one of the pleasantest, as well as the most imperative, duties of the editor.

We shall endeavour to make amends for past neglect by occasionally drawing attention to the meritorious issues of this renowned establishment.

ART IN THE PROVINCES.

MANCHESTER.—The Mechanics' Institution of this city has recently risen to such an extent and importance as to call for the erection of a new and larger building than that hitherto used for the accommodation of the members and the business of the society. The edifice now erecting is approaching completion; and the directors of the Institute propose to open it in the ensuing autumn, with an exhibition of the Fine and Industrial Arts, of every kind,—paintings, sculpture, engravings, antiquities, scientific inventions, raw materials, industrial products, machinery, &c. In short, they hope to make the exhibition a "miniature edition," so to speak, of what has been witnessed in Hyde Park and in the Champs Elysées; only limiting it, we presume—though we are not certain—to objects of home production, so far as the Industrial Arts are concerned at least. The floor space in the new building applicable to the purposes proposed, exceeds 20,000 feet, and the walls are well adapted to the display of pictures, drawings, engravings, &c. We are desirous of aiding the object of the directors, by calling the attention of such of our readers as are in a position to assist the undertaking to what is contemplated. There is enough of spirit and enterprise in Manchester to carry out such a project successfully, as regards the thickly populated district in which it is situated, and profitably, as regards contributors; and it is only by the constant exhibition and comparison of works of science and skill that retrogression or progress is made manifest. We believe that the appeal which the directors are making will not be in vain; and we doubt not when the opportunity for reporting the result arrives, we shall be able to congratulate them on their success. It is right we should mention that Mr. O. Heywood, the president of the institution, or Mr. E. Hutchings, the secretary, will be glad to reply to any communications on the subject that may be addressed to them.

LEEDS.—Three competitors, Messrs. Behnes, Noble, and Milnes, have sent in models for the statue of the late Mr. E. Baines, in this town: that of Mr. Milnes was at once placed *hors de combat*, but the committee being unable to decide between the other two, have requested the sculptors to make such alterations in their models as they may consider necessary, or to produce entirely new ones. Mr. Milnes was voted the sum of 20*l.* as compensation for his labour.—The Wellington statue, by Marochetti, has arrived in Leeds, and will, ere long, be erected in the place of its destination, opposite the town-hall.

CARLISLE.—The annual meeting of those interested in the School of Art in this city took place at the end of November. The institution has not been in operation much longer than a year, but during that period the average number of pupils attending the central school was fifty-nine, while various public and private schools availed themselves of the services of the master, and an exhibition, opened at the central school, had been visited by upwards of two thousand persons. The number of pupils continued to increase, but the institution is in debt to the amount of 125*l.*, arising from the expenditure in fitting up the school, and furnishing it with models; to clear off this debt about 52*l.* had been subscribed. The current expenses of the institution were almost met by the receipts.

WORCESTER.—The friends and patrons of the School of Art, recently established in Worcester, had their annual meeting on the 30th of November. The report stated that the school continued to extend its operations and to give promise of satisfactory results. The number of pupils who attended the classes during the past year reached 287, and 400 children of four public schools had received regular instruction in elementary drawing, being an increase of 329 over the preceding year. In the course of a speech delivered by Lord Ward, who presided on the occasion, his lordship took occasion to remark on the success which had attended the Schools of Design in the Potteries of Staffordshire, and instanced Mr. Minton's beautiful display of manufactures at the Paris Exhibition, which had been all eagerly bought up, while orders had been given to the manufacturer that would take him a very considerable time to execute. This, Lord Ward said, ought to act as a stimulus to the manufacturers of Worcester to provide themselves with real artistic assistants, and also should induce them to aid their school by pecuniary contributions; it is at present in debt to a small amount, the donations and subscriptions having fallen off during the past year.

BELFAST.—Owing to some misadventure, we have only very recently received a report of the inauguration, at Belfast, of the statue erected in that city to the memory of the late Earl of Belfast, a nobleman in the truest sense of the word, whose death, at the early age of twenty-five years, was a severe loss to the country of his birth, and indeed to the whole kingdom. The statue was inaugurated by the Lord Lieutenant, the Earl of Carlisle, with due solemnity, and in the presence of a vast concourse of spectators met together to pay due honour to a man whose brief life was passed in endeavours to ameliorate the condition of others, and to promote their intellectual and moral growth. The speech delivered by his Excellency was one of the most eloquent tributes to departed excellence that we ever remember to have read. So also was that of a young nobleman, Lord Dufferin, at the banquet given subsequently, on whose shoulders the mantle of the deceased earl seems to have descended, in the ability and desire to benefit others. "Fresh generations," said Lord Dufferin, "shall tread in the streets of your town; your city itself shall increase in wealth and splendour; the names of most of us who have associated at this day's ceremony shall be forgotten; but still amongst all chance and change, that statue, standing so silent and motionless upon its pedestal, in the centre of the rushing tide of human life that ever flows to and fro around, shall still preserve the memory of Frederick Richard, Earl of Belfast." The statue is of bronze, the work of Mr. Mac Dowell, R. A., and is a fine example of portrait-sculpture. Mr. Mac Dowell is a Belfast man, and we have no doubt, exerted his utmost on a work which will do him honour as well as him whom it represents. But as we propose to engrave it among our sculpture illustrations, we postpone our remarks till we can enter upon the subject more at length.

HARLECH.—A favourite subject with our painters of Welch scenery, the old castle at Harlech, on the coast of Merionethshire, is being repaired at the cost of the government; the office of Woods and Forests has it in its keeping, and it is the third of the ancient castellated buildings in Wales which the authorities within the last few years have undertaken to restore.

BRITISH ARTISTS: THEIR STYLE AND CHARACTER.

WITH ENGRAVED ILLUSTRATIONS.

No. XI.—SIR AUGUSTUS WALL CALLCOTT, R.A.

OUR recollection of the Royal Academy extends over a period of somewhat more than thirty years; yet, during that comparatively short space of time, what a change has passed over this associated body of artists. Of the thirty-eight Academicians, whose names appeared in the Catalogue of 1824, from which we date back, eight only are now living:—Baily, A. E. Chalon, A. Cooper, R. Cook (an artist, by the way, whose works we have never seen), Mulready, Sir R. Smirke, J. Ward, and Sir R. Westmacott. Of the nineteen Associates of that year, all

have gone from the scenes of their labours except Leslie, Jones, and W. H. Pickersgill. Year after year, as our eyes have glanced round the walls of the Exhibition-rooms, the pleasure we felt at the sight of some rising star, whose genius seemed destined to add new lustre to our school, has been mingled with hearty regret for the loss of those luminaries whose suns had gone down—many

of them "while it was yet day." Year by year have we missed from their accustomed places the fine historical compositions of Hilton and Northcote, the wild imaginings of Fuseli, the elegant conceptions of the venerable Stothard, the classic graces of Howard, the gorgeous colourings of Etty, the courtly portraits of Lawrence, Shee, and Beechey, the vigorous, manly faces that Jackson and Phillips transferred to their canvasses, and the humours of the inimitable Wilkie. Among the landscapes, too, have gradually disappeared the Indian jungles of Daniell, with their wild inhabitants, the corn-fields and meadows of Constable, glittering with dew and sunshine, the cottage homes and sandy shores of Collins; the scenes in England and in Italy which Callcott painted as with a pencil of silver, and those which Turner gave us from a palette laden with all the tints of the rainbow. Descending from the pictures to the Sculpture-room, we have looked in vain for the classic groups that Flaxman modelled, and the graceful forms which Chantrey was wont to present to his visitors. These are the more noted names that a few brief years have taken from us; names which will for ever be ranked amongst the brightest in the annals of our native School.

Music and Painting have through a long series of years found their homes in two families allied by marriage, and residing in a locality whose name to those unacquainted with the spot would seem to have but little harmonious association with the Arts, of any kind. Kensington Gravel Pits, such is the place alluded to, whatever it may have been in days of yore, is now adorned with some venerable picturesque mansions, such as in the present day are rarely to be found in the suburbs of London, almost concealed by stately trees of far older growth. Here, or in the immediate vicinity, for a period extending to nearly a century, lived, or now live, Dr. Callcott, William Horsley, and William Hutchins

Callcott—names well known to every lover of genuine English vocal compositions—Sir Augustus Callcott, and John Callcott Horsley, the newly-elected Associate of the Academy. Sir Augustus Callcott was born in 1779, at Kensington Gravel Pits, and resided there all his life, a period of nearly sixty-six years. He gave early indication of a taste for the Fine Arts in general, but in consequence, it may be presumed, of his relationship to Dr. Callcott, his brother, he chose music as a profession, and for some years officiated in the choir of Westminster Abbey, under the late Dr. Cooke. Whether or not he employed his pencil during this time, we are unable to state, but before he had reached his twentieth year he had studied portrait-painting under Hoppner, and had exhibited a portrait which augured considerable success in this department of Art; but he very soon turned his attention to landscape, and frequently was heard to say, that he was greatly induced to change his practice from seeing Stothard's charming designs to "Robinson Crusoe."

It was, we believe, in 1803 that Callcott first made his *début* as a landscape-painter, in which he was so successful that, four years afterwards, he was elected an Associate of the Royal Academy. In 1810 he became a Member, sending his "Morning" as his diploma-picture; the highest honour of the profession was thus rapidly attained, and never was it more worthily bestowed; while the admiration his pictures excited, and his inestimable private character, procured for him the friendship and encouragement of all the distinguished patrons and lovers of Art of his time. In 1827, Callcott married the widow of Captain Graham, R. N., and daughter of Admiral Dundas, a lady whose extensive erudition and writings gave her a distinguished place in public favour.* With her he visited Germany, the Tyrol, and Italy, and applied to the scenes of nature and works of Art, to which his travels introduced him,

the cultivated perceptions of a mind ever alive to the suggestions derivable from both. It was this habit of constant and watchful observance that gave to his conversation such an interest, and to his criticism so much worth, from its truth and discrimination.

In 1837 her Majesty was graciously pleased to confer on Mr. Callcott the honour of knighthood, as an especial mark of his Sovereign's recognition of his merits as a painter, and of his personal excellencies. In 1843, her Majesty gave another testimony of royal approbation, by appointing him Keeper of the Royal Collections of Pictures, an office then vacant by the death of Mr. Seguier. At the time this appointment was made Sir A. W. Callcott was sinking under the pressure of disease, and, actuated by delicate and honourable feeling, he hesitated to accept so important and onerous a post; but, as both the Queen and Prince Albert graciously expressed a wish that his state of health should not interfere with the acceptance of the trust, his scruples were removed. In the due arrangement and classification of those treasures of Art which form the Royal Galleries, and of which a large majority of the most interesting the public have now the opportunity of knowing through the *Art-Journal*,

he was sedulously employed till death terminated his labours, after

[J. & G. P. Nicholls.

* Lady Callcott, when Mrs. Graham, went to India with her husband, in 1809, where she remained two years, visiting during that period many of the most remarkable places in the country, and published an account of her travels on her return home. At a subsequent period she made a journey to Italy, where she resided for some time; the results of this visit were two separate volumes, "Three Months in the Environs of Rome," and "Memoirs of Nicholas Poussin." In 1821 she embarked with her husband for South America, but Captain Graham died on his passage thither, and was buried at Valparaiso. In 1836 her last literary production appeared, under the title of "Essays towards the History of Painting," a most useful contribution to the library of the Art-student.

an illness of many years' duration, which was interrupted only by short intervals of comparative health, that excited the hopes, though they scarcely allayed the fears, of his numerous friends and admirers. He died on the 25th of November, 1844, and was buried at Kensal Green.

works of a landscape-painter scarcely admit of so detailed a criticism as do those of a painter of history or of *genre* subjects. His favourite themes were those wherein water occupied a prominent place; and many of his most charming pictures were made up of coast scenes: it was Sydney

Smith, we believe, who christened him "Sea-shore Callcott." He very rarely attempted figure subjects, strictly so called; but in 1832 he exhibited a picture of "Italian Girls going in procession to their First Communion;" and in the following year "Shepherd Boys with their Dogs." But his most important work of this character was "RAFFAELLE AND THE FORNARINA," exhibited in 1837, and engraved by the Art-Union of London, and which we have introduced here as an example of Callcott's ability to treat the historical class of subject.

Callcott has been called the modern Claude, so also has Turner; but Callcott's works, both in composition and colour, bear a closer resemblance to Claude's than do those of Turner. His distances are deficient in the space we find in the landscapes of the old master, but the aerial perspective is exquisitely rendered, and the general effect of the distance more pleasing. He was a close imitator of nature, observing her with the eye of a true poet, while he interpreted her with the most exact fidelity. "With a fine feeling," says Dr. Waagen, "for

RAFFAELLE AND THE FORNARINA.

[J. & G. P. Nicholls.

the picturesque in conception, he unites a delicacy of drawing most favourably seen in his figures and animals, which are most tastefully introduced. In his earlier pictures, the colouring is powerful, and often warm; in his later, rather too uniformly cool, and sometimes almost insipid. His execution is spirited and careful." The critic, when he spoke of "insipidity," was unconscious amid how much personal suffering and consequent mental prostration these works were frequently produced. His pictures, many of which were publicly exhibited after

his death, are to be found in every English private gallery of any repute.

High as Callcott stood in public estimation as an artist, those who had the pleasure of his personal acquaintance held him in still higher regard. His private character exhibited many of the most beautiful traits which pertain to the excellent of the earth, kindness, gentleness, benevolence, uprightness; he was literally a father to the fatherless, and a man of warm and generous feeling, showing itself in deeds of charity, the result of principle, not of impulse: his memory is revered by all who knew him.

SHEFFIELD PLATE.

THE PATENT ENGRAVED PLATE OF
MESSRS. SKINNER & BRANSON.

SHEFFIELD has been long famous, all the world over, for its plated goods; so famous, indeed, that its name affixed to metal productions at once indicates its character; and this supremacy it maintains, notwithstanding active competition of other British towns and in several cities of the Continent. Centuries before it acquired fame for its "plate," its steel had been renowned; Chaucer, in his "Pilgrimage to Canterbury," gives the miller "a Sheffield whittle"; but it was not until the middle of the 18th century that the "substitutes for silver" originated here. It is still "unrivalled in the extent to which this manufacture is carried, and in the elegance and durability of its productions,"—those of

Sheffield bearing a higher price in "the market," than those of any other locality. The history of this process, which has, during little more than a hundred years, grown so enormously as to give employment to nearly half a million of persons, is so very simple and may be told so briefly, as to justify its introduction here:—

"In 1742 Mr. Thomas Bolsover, an ingenious mechanic, when employed in repairing the handle of a knife, composed partly of silver and partly of copper, was, by the accidental fusion of the two metals, struck with the possibility of uniting them so as to form a cheap substance, which should present only an exterior of silver, and which might therefore be used in the manufacture of various articles in which silver had before been solely employed. He consequently began a manufacture of articles made of copper, plated with silver, but confined himself to buttons, snuff-boxes, and other light and small articles. Like many other inventors, he probably did not see the full value of his discovery, and it was reserved for another member

of the Corporation of Cutlers of Sheffield, Mr. Joseph Hancock, to show to what other uses copper, plated with silver, might be applied; and how successfully it was possible to imitate the finest and most richly-embossed plate. He employed it in the manufacture of waiters, urns, tea-pots, candlesticks, and most of the old decorations of the side-board, which, previously to his time, had been made solely of wrought silver. The importance of the discovery was soon fully understood."

The subject to which we more immediately direct the attention of our readers is an improvement very recently introduced into "Sheffield plate," by Messrs. SKINNER & BRANSON of that town; and although we associate with this notice a group of engravings of the principal objects of their manufacture, our purpose is mainly to offer some comments on the leading feature of their works, although their productions are not limited to their own particular patent. The advantage of this patent consists

THE PLATED PRODUCTIONS OF MESSRS. SKINNER AND BRANSON.

in the engraved ornamentation to which an article is subjected; being bolder, more effective, and bearing a nearer resemblance to hand-work than has been hitherto achieved, while as a mechanical process chiefly, or entirely, the work is effected at a very trifling cost. Indeed, the cost of an article thus ornamented, very little exceeds the price at which it could be sold plain. As the process is patented, there can be no objection to explain it, and Messrs. Skinner & Branson have supplied us with the following details, abridged probably from their specification:—*

"The process is as follows:—Take first a copper-plate, and take from it an impression with an ink made by boiling linseed oil to the consistency of common treacle; the paper used is thin, similar to that in use by the potters in transferring prints to

earthenware. When the impression is taken it is transferred to the article to be decorated, the ink used being of a sticky or glutinous nature. A sponge and warm water is then used to crumble off the paper when the impression of ink will be found on the metal surface; fine resin (powdered) is then applied to the surface through a sieve of fine gauze, the fine particles of resin fix themselves closely to the sticky impression, in fact sink into it. In this state the work is left for a few hours; by this time the impression becomes completely saturated with the resin. A soft brush then dusts off the powdered resin from the surface of the article, and it is perfectly cleansed from the loose resin (which is very important) by a soft rag. By this time you have the resin sunk into and on the design, while the surface is perfectly clean from it. In this state, hot water is poured on the work, which melts the resin and amalgamates it with the printing ink which becomes a varnish sufficiently powerful to resist strong acid. The work is then bitten in in the same manner as engravers bite in

their work. The surface being cleansed, the article is ready for plating."

The acids used are, of course, the secrets of the trade; in fact, the process in its earlier parts resembles that adopted by the potter, and in its latter stages that in use by the engraver, or etcher. As it is, however, the application has produced very satisfactory results, with the important advantage that, as it is easy and rapid, but little extra expense is incurred by the manufacturer, and, consequently, but little by the consumer. The one thing wanted is GOOD DESIGN: this is indeed the "all in all" required by so many of our manufacturers. Hitherto, Messrs. Skinner & Branson have striven for strong effects rather than for a purer order of ornamentation; but they are rapidly advancing in this respect, and we hope to see arise from this valuable patent a marked improvement in all classes and orders of "Sheffield goods."

* Their patent includes other modes of producing this work, with these effects, but the one referred to is that which they chiefly use.

SUGGESTIONS OF SUBJECT TO THE STUDENT IN ART.*

BY AN OLD TRAVELLER.

CHAPTER I.

Introduction—Effect of Themes repeated—Fields open to the Artist—Sources awaiting the Pioneer—Pictures lost in Portfolios—Hypatia in the Schools—The Daughter of Theon borne to the Basilica—The Captive's Prediction to Agrippa—The Emperor Charles V. and the Woodman—Illyrian Ballads—The Heydukes—Love wakes the Dead—St. Mary the Egyptian—Dante—The Angel at the Gate—Monsieur du Corbeau—An Irishman's Version of La Fontaine—A Georgic of the Day—Immortal Youth of Oxen: Mago to wit—Concino Concini—Eleonora Galigai—Death of Gustavus Adolphus—Francis Albert of Saxo-Lauenburg—Duke Bernhard of Saxo-Weimar.

AMONG the many and various merits of Mr. Leighton's truly admirable work, "The Madonna of Cimabue, carried in procession through the Streets of Florence," not the least important is the fact that the painting is a highly suggestive one. Who can stand before this picture without finding incident after incident recur to his memory, each attaching itself in some manner to the story of the well-known personages represented in the painting? Now we have some touching or stirring episode, heard once again in the musical periods of Dante, or there rises before us some noble structure, recalled by the figures of Arnolfo di Lapo, or Nicolo Pisano; then passes some jacketed angel, or other quaint apparition, summoned to the mind's eye by the forms of Gaddo Gaddi or Simone Memmi. Or, it may be, that the more youthful spectator shall be laughing in his heart, as he pictures to himself some wicked prank performed by the mischief-loving Buffalmacco; whether fixing his tiny torches to the backs of great beetles, and setting the creatures to crawl about his chamber, in the hope of euring his master, Andrea Tafi, of the inconvenient practice, adopted by the latter, of rousing him to his work before the dawn; or whether salting the broth of his neighbour, Capodoca, in return for the music of that spinning-wheel, which the goosehead's wife did not fail to set whirring, before Buffalmacco had well laid his head on his pallet—the painter's couch, unluckily, standing in too close proximity to the instrument of her industry.

It will be remarked that we here allude chiefly to the facts and incidents recalled by Mr. Leighton's "Cimabue," making but slight mention of its higher action on the regions of thought and feeling. The obvious effect of the work in these directions we do not now insist on: our business for the present is rather to invite attention to the many pictures existing in and called up by the one painting before us; and we are led to confine ourselves to this consideration by the dearth of subject that would seem to exist among artists, if we are to judge by their very frequent reproduction of the same idea, and by the pertinacity with which they cling to some few hacknied themes.

Certain remarks to this effect, with expressions of regret that a new and good subject was not more frequently treated by our rising artists, were heard to proceed from a group of accom-

plished amateurs, at the private view, on the opening of the Royal Academy's Exhibition, in the present year, and they were such as might have been listened to with advantage by more than one amply-gifted aspirant to the honours of the brush.

For how many a nascent light is extinguished by the deadening chills of that indifference with which the ordinary spectator turns from the oft-repeated tale, but too generally presented by the canvas of our painters! Or if to this it be replied that the true master in Art, the judge, on whose decision the student's hopes are hanging, will detect the merit of the work, however hacknied its theme, may not the *lover* of Art rejoin by asking, "Why, yet, should the youthful painter do his genius the wrong that results from ever harping on so few strings, when he has the full diapason wherewith to charm the spheres? Wherefore will he submit to endure the cold reluctance of that faint regard which is all we give to the well-known, and often-related, when the boundless universe, with mines of yet unappropriated wealth, lies before him? when, not this world only, 'with all that it inherits,' but every other also, with whatever riches they may be endowed withal, is *his* domain!"

Yes, certainly; for if science have her limits, that she may not overpass, none have yet been laid down for the realms of imagination. Let the learned waste their breath over such questions as whether this or that planet have its dwellers; but for you—Oh, ye of higher destinies! the radiant creatures that make bright *your* visions, shall richly suffice to people each and all, if such shall be your pleasure! Admitting, then, that you have "conquered worlds," what shall forbid you to "imagine new?"

But is this so? Has the painter, verily, nothing more remaining to him beneath the glimpses of the moon? Has he indeed exhausted all the resources of our own poor planet? Can the history of nations offer no event of interest sufficient to tempt his notice? Is there nothing in poetry that may stir his spirit? Does the drama present no scene still worthy of his pencil? Has exquisite Nature no effect, as yet unmarked by the crowd of her lovers? Nay, has not our daily life full many an incident yet untold of the limner? Enough there is, in each and all of these limitless regions! Do but look for yourselves, ye who aspire to join that band of immortals, amidst whose shining ranks "Cimabue" so worthily holds his place. Follow not, each on the trace of the other, as do sheep that would enter the penfold, but acknowledge, once for all, that Judith, with her ill-won trophy, is not the only treasure to be gathered from the stores of Holy Writ; that his Ophelia, his Beatrice, are not the sole creations of our world-adored Shakspeare; that the Florentine has other pictures beside that of his Francesca; or—to descend at once into such an atmosphere as we have strength for breathing in—that one may at length be supposed to possess a sufficiency of Marianas, more especially when we consider how few of those paraded before us bear the palest resemblance to that Mariana of the poet, whose delicate presentment is but marred by the many counterfeits usurping her name.

Should then the painter be a book-worm, perpetually hunting through the widely spread regions of storied eld, for the "subject" that, in such case, he would, perhaps, be slow to find? Or should he consume his days in the study of those "modern instances" so much less likely to reward his labour? By no means. There is not indeed any great danger in this our time, that the younger votary of Art should wear his eyes out over black-letter; and if the many among his brethren who have made shipwreck on the rocks of commonplace, do not warn him from putting his trust in the last new poem, or "the novel of the season,"—Heaven save the mark!—no lamp that we have the force to light could avail to serve him for a beacon; nor is he of the number of those for whom we could hopefully sound the note of warning.

But the question of how, and to what extent, the artist should be a reader, is one into which

we are not now about to enter; here, as in all beside, the golden mean is, without doubt, the golden rule; and in no case do we advocate undue devotion to book-lore, whether of the old or the new. Nay, since life is indeed so short, and Art so long, there at once arises the question, has the painter leisure for protracted communings with the historian and the poet, the dramatist or the mythologist? and we incline to think that he has not. His hours are all too few for the various studies attaching themselves peculiarly to his own most glorious art. The demands of the painting-room, with its numerous dependencies, and often conflicting claims, have the right to supersede those of the library, and therefore are we about to try if we cannot assist the student to economise those precious hours. We propose, that is, to delve for him, in the fields extending their illimitable space around us, presenting for his selection whatever may be found, that shall seem to offer matter worthy of his notice.

In this attempt to serve as the painter's pioneer, we shall not confine ourselves to order of time, nor seek to establish arrangement as to class of subject. Passing through all ages, and examining each period of the world's progress, we shall levy contributions from all sources, and take our spoil wherever it may be found; our object being to offer suggestions that may suit themselves to all good tendencies, and gratify every pure taste. Thus, times, ancient or modern; lands, far or near; story, national or personal; incident, grave or gay; each in turn shall be made to render tribute, and take part in that service of the youthful student in Art, whereunto we propose to devote the pages that follow.

Nor, among the sources whence we may probably draw, for his advantage, will the least abundant be found in those stores of undeveloped thought, often much lamented over by the present writer, during a life-long perambulation through all the best-known, and not a few of the more obscure, Galleries of Europe. We allude to the many admirable designs lying incomplete—perhaps never to be completed—and now lost amidst forgotten leaves in the numerous portfolios, over which we have not unfrequently been permitted to pass a delightful hour, when "living glorious days" among the studios of northern or southern cities. In the number of these has been found many a well-selected theme, rarely carried beyond the life-like sketch, dashed off in the first heat of conception, or, if worked out into the series of studies, serving to exhibit the more advanced purpose of the author, yet never matured into the noble and admirable picture of which not a few give ample promise.

"Hypatia in the Schools" and "The daughter of Theon borne to the Basilica" were the titles appended to two of these sketches; and in this instance the world of Art has sustained all the greater loss from the non-completion of a worthy purpose, because the hand of the artist is now cold in death. Nor has this subject been treated, so far as we know, by any other master.

In the first of the works in question, the beautiful daughter of Theon is presented in the midst of her disciples. She has risen to receive the Patriarch Cyril, who is entering on the one hand, while Orestes, Prefect of Alexandria, departing on the other, turns a glance of anger and disdain on the Patriarch. This last circumstance shows the point of time selected to be that when the enmity of these rivals in ambition had reached its climax, and was soon to result in the destruction of the virtuous Hypatia.

These sketches, some parts of which are exquisitely finished, exhibit many high qualities. The artist represents forcefully, because he has felt strongly—one of the first requisites to success. His composition is clear and simple. The principal groups are nobly conceived, while the subordinate figures, which are numerous, give occasion for a rich variety in attitude and expression; nor has the master neglected his opportunity. The face and form of Hypatia, in particular, are remarkable for their intellectual beauty and high refinement: the *pose* of her

* [We have for a very long period desired to obtain a series of papers that might be so constructed and arranged as to supply suggestions of subjects for the artist. The task we know to be one of no ordinary difficulty, demanding a combination of requirements very rare—extensive reading, acquaintance with many languages, the advantage of travelling in several countries, and above all an intimate acquaintance with Art, in the past and in the present, and a power to estimate its wants, its capabilities, and its results. The accomplished lady who has commenced these papers, has already obtained the respect and confidence of the artists by her translation of, and notes to, Vasari; and the grace and vigour of her style have obtained for her a wide popularity. We believe she has visited all the leading capitals of Europe, where her chief objects of attraction and study have been the collections of pictures; her other advantages are of a high order, and we believe few persons could be found so well qualified to execute the task we have had the pleasure to place in her hands. We have no doubt of seeing the results of her labour and research in our future exhibitions, giving to them a variety and a character hitherto unknown to them.—Ed. A.-J.]

† "Capodoca," i.e., "Goosehead," was the bye-name given by Buffalmacco to the neighbour in question.

figure is simple and elegant; from one hand she is laying a scroll (on which may be read a portion of the word "Diaphantus," in the Greek character, showing that the beautiful sage had been engaged with a work of that rhetorician, when interrupted by the visit of the Prefect), while with the other she has gathered up the ample folds of her flowing drapery, her action exhibiting inexpressible grace and dignity. The mingled sweetness and gravity of her features are in perfect harmony with that high character for purity, diffidence, and every other feminine virtue, accorded to Hypatia by the united voices of history. Her finely-formed head is turned towards the haughty figure of the approaching Patriarch, on whom she has fixed the calm gaze of her thoughtful eyes, and whose form—of truly regal port—comes proudly sweeping towards her, with a movement, the life and animation of which are among the highest merits of the work. The architecture is of correct proportions; and the minor accessories have a propriety and significance which do but increase the regret of the beholder, as he considers that all is but a promise not destined to be fulfilled, unless, indeed, some youthful aspirant, becoming sensible to the attraction of the subject, as here presented to him—but treating it according to the dictates of his own genius—should some day establish his fame by the truthful representation of a woman who so well deserves to be commemorated.*

In the second sketch the calumniated Hypatia is in the hands of her ruthless murderer, the fiend-like Petron, who has dragged her from her chariot as she was returning from the schools. He directs his myrmidons towards the Basilica, within whose desecrated walls her pure spirit was destined to depart, and seek congenial skies, but not until the wholly innocent victim of an implacable hatred had suffered torments such as memory shudders to recall. The head of Hypatia is the only part of this study that is more than faintly indicated; the demon countenance of Petron (or Petrus as he is also called) alone excepted.

The following passage has been more than once discussed by the present writer, with very competent authorities, all of whom have admitted its aptitude for the purposes of the Painter; it is further recommended by the easy accessibility of the author, who is, indeed, in the hands of all.† The words of the writer are these:—

"Now Agrippa stood in his bonds before the royal palace, and leaned on a certain tree for grief, with many others who were in bonds also. And beholding a certain bird on the tree (the Romans call it *buho*, which is an owl), one of those bound, a German by nation, asked who was that man clothed in purple, and having been told, he begged leave of the soldier to whom he was chained, to approach him. Being suffered to do so, the German captive addressed Agrippa in these words:—'O young man, know well that thou shalt soon be delivered from these bonds, and wilt attain to such dignity that he who now pities thy hard fortune shall envy thy greatness. Know also, that when thou shalt see this bird once again, thou wilt then have but five days more to live. I appeal to my own country gods as well as to thine, that these words are true; and I adjure thee by all these gods, that thou forget not my bonds when thou hast obtained thine own freedom, but seek to deliver me; so that I be witness to thy good fortune.'"

The life of the Emperor Charles V. is one that has received due attention from painters, but here is a short anecdote, related by Sandoval, in his history of that monarch, which appears to have escaped their notice, although not incapable of effective delineation, as was proved by a spirited design made, at the suggestion of the present writer, by a student in the gallery of the Academy at Venice:—

"The Emperor was hunting the stag at no great distance from his capital, and chancing to

outstrip his attendants, struck the quarry while thus alone. He had scarcely done so before he espied an old woodman, driving an ass with a load of wood on its back.

"Lend me thine animal to convey my game to the city," said the Emperor; "and thou shalt be paid for his labour and thine own."

"Not so, brother!" returned the woodman; "yon stag is a heavier weight than my beast may bear. You are stronger than he, and might carry both him and the stag together, if need were. Take your game on your own shoulder, then, and God be with you."

The scene of this incident, as given by the young Venetian above alluded to, is a forest-glade of surpassing beauty; the group formed by the colloquists and the animals, is placed partly within the shadow of some noble trees, while a stream of sunlight pouring down a distant ravine, gives to view the retreating figures of a hunting-party, yet without unduly distracting the attention from those in the foreground. Of these, that of the emperor exhibits the form and head rendered familiar by his numerous portraits, but wearing an expression rarely seen on it,—amused surprise, namely,—at so unwonted a circumstance as the refusal of his request, and the puzzled, half-doubting look of one not yet certain that so strange a thing can have occurred. The sturdy determination of the woodman is, nevertheless, sufficiently obvious in his attitude and action, as he turns the head of his ass to lead him thence; nor is there a trace of indecision in his countenance, which is yet not stern or displeasing; on the contrary, it is that of a perfectly good-humoured, and very handsome old man. The face and figure of a stolid-looking peasant boy, who accompanies the woodman, lend additional variety to the expressions depicted.

Inexhaustible is the wealth of picture to be found in the national songs and ballads of the Slavonic tribes, and of all their congeners. Those chaunted by the peasant of Illyria to his single-stringed guitar, called the *guzla*, are more particularly valuable as viewed in this light. Among them is one composed by a performer who enjoyed high reputation in his country, and from this more than one fair canvas might be filled. The composer is Hyacinth Maglanovich, and the ballad, called "The Death of the Heydukes," is as follows:—

"Within the shade of a deep cavern, and stretched on its hard floor, lies a brave Heyduke, the dreaded Christich Mladin; beside him kneels his faithful wife, and at his feet are their two dauntless sons.

"Three days have they remained without food, nor hath the blessing of water moistened their lips, for each pass of the mountain is held by their foes, the cowardly Pandours; yet none dare suffer a plaint to be heard, for they fear to displease Christich Mladin.

"On the fourth day spake his wife; 'May the Holy Virgin take pity on us, and deliver you from your enemies,'—then she breathed a sigh and died. With eyes unwet Christich Mladin regarded the dead form of the wife he had loved, but his two sons wiped away their tears when he saw them not.

"When night fell, the elder became frantic; he drew the broad hanzar* from his belt, and glared on the dead, as doth the wolf on the lamb,—but his brother seized the weapon, and piercing his own arm, he said, 'Drink of my blood, O brother, and commit no crime. When we have all died of this fire of thirst, shall we not return and quaff the blood of our enemies?'

"Then rose Christich Mladin from his lair. 'Children,' he said, 'it is enough! we will descend to the plain. Better is a true bullet than the grim death of hunger.' These words uttered, all three rushed down with the rage of wolves, each slew ten men of the foe, each

received ten bullets in his heart; but when the dastardly Pandours had cut off their heads, they dared not look in the faces of the slain, so heavy on their souls lay the dread of Christich Mladin and his children."

Of a different character, yet not without its uses for the painter, is the following fragment of a ballad still sung by the peasantry on the eastern frontier of the Austrian Empire; that joining the Turkish border; namely,—

"The warden of the tower hath the fairest of daughters, but the eyes of a Moslem captain have fallen on the maiden, and her tears have washed the roses from her cheek.

"Doth not the prond one say, 'Give me to wife that sweetest maid;' but Hanka beheld her father tear his beard, as he listened to the words of the messenger,—her heart hath, moreover, been wiled from her keeping, she hath given it to a brave Tambourgi, and she bids them prepare her grave, saying, 'Better for my mother's child is the earth of her tomb, than the pearl-bestrewed cushions of a Moslem dwelling.'"

"Then the captain of the misbelievers came to demand his bride. He came in his youth and beauty, with the love of his heart beaming forth from his eyes, for he had watched the maid in secret, until his son had become one with hers,—and well had he taught her to love, though she knew him not, save as the humble Tambourgi.*

"But they bade him look on the cold bier where she lay, and told how her bridal bed had been prepared beside her mother's grave. 'Nor long for me shall wait the angel of the tomb,' were his words, as he bent, with a lip that trembled in the anguish of despair, to press the farewell kiss of a hopeless heart, on those eyes that should have been the light of his own.

"When, lo!—mark ye the wonder, maidens—the lids of those eyes rise softly,—their beams shine forth—the celestial blue!—and the setting sun hath seen the Moslem bear a willing bride to his home."

From that inexhaustible storehouse of painters, the legends of the saints, even the older masters have but very partially drawn; confining themselves to some few constantly repeated subjects, that will at once recur to the memory of all who are familiar with foreign galleries. But among these often related stories, we do not remember to have seen any work commemorating the meeting of St. Mary of Egypt with Zosimus the anchorite, one slight study alone excepted, and this, though subsequently worked out to a certain extent, neither has been, nor will be completed. Yet the subject is one not incapable of rendering pictorial effect. St. Mary has discovered the anchorite on the bank of a wide and rapid river, but she is herself on the opposite shore, and cannot find bridge or boat to cross the stream. Undismayed by what would in most cases prove a formidable obstacle, Maria Egyptiaca, as this saint is called in the Roman church, bids the holy man cast his mantle on the waters; this he accomplishes at her bidding, and, floating over to the bank whereon she stands, that frail-seeming bark receives the saint, and bears her safely to the desired shore.

In the study of the subject just alluded to, the figure of the old man, "black with fasting," as the legends describe him, is placed beneath an overhanging rock,—that of St. Mary, remarkable for grace and beauty, floats prosperously towards him; the landscape is a fine one, and the amazement of two herdsmen, who behold the saint proceeding on her voyage, is extremely well depicted. One of them has fallen on his knees in the act of adoration.

In the eighth canto of Dante's *Inferno*, and towards the closing lines of that canto, is a grand picture yet unpainted, so far as the knowledge of the present writer extends. The frescos executed in the Villa Massimi, at Rome, by

* Tambourgi, drummer.

* See Morel, "Dict. Hist.," or the English reader may consult Enfield, "History of Philosophy."

† Josephus (Whiston's translation), "Antiquities," Book xviii., chap. vi., sect. vi.

* Hanzar, knife or dagger.

† Belief in the existence of vampires has never been extinct among the Illyrians, and many a man of their vengeful tribes is said to console himself in death with the thought expressed in the text, that of returning as a vampire to drink his enemy's blood.

Philip Veit, Overbeck, Julius Schnorr, and Cornelius, may possibly comprise this subject, but the writer cannot recall it, and does not believe it to be included. A slightly similar, but much less important theme was ably handled by Moralt of Munich, a pupil of Cornelius, in 1843. This picture, an oil-painting, will be in the recollection of many, and of Flaxman's Outlines to Dante no mention need here be made, since it is familiar to all; the passage in question is, however, not included among those chosen for illustration by the great sculptor. But whether painted, and whether sculptured, or not, nay, even if treated by all who have sought inspiration in the Divine Commedia, from the time of Dante downwards, the subject is one not sufficiently known in the country, and the student who shall choose it will do well.

The Poet is advancing with his guide towards the city of *Dite*, near the vast gates of which are bands of fallen spirits. But their pristine radiance is not wholly lost beneath the shadows of the demon nature fast involving them,—their forms are yet grand, their features retain a mournful beauty, or, at the worst, are but partially marred by a bold defiant haughtiness, which is yet not all demoniac; one of the number, only, exhibits the malignant aspect of a being wholly corrupt. They are pouring into the city—after a vain attempt on Virgil's part to procure admission for Dante, and are closing the ponderous gates.

But a Spirit of light is meanwhile descending, his mighty pinions bear him irresistibly onward, and towards the city—the giant valves of its portal shall be cast wide by his touch, and the Florentine, with his Mantuan guide, shall proceed to explore the marvels within.

Dante declares the approach of the angel to be as that of the mighty rushing wind: the whole passage is too long for quotation here, but a few lines describing the advance of the celestial visitant, may be acceptable. The student who shall desire to read the whole will find it in *Canto ix.*, 66,—or if he prefer a translation, that of Cary will serve his purpose well; it is from him that I borrow the version appended in the note, since a more faithful one could not easily be made. The words of Dante are these:—

"E già venia su per le torbide onde,
Un fraesso, d'un suon pien di spavento,
Per cui tremavan amendue le spoude,
Non altrimenti fatto che d'un veuto,
Impetuoso per gli avversi ardori,
Che fier la selva, e senza alcun rattenuto,
Li rami schianta abbatte e porta fuori,
Dinnanzi polveroso va superbo,
E fa fuggir le fiere, e li pastori."*

INF., Canto ix., 66.

That the comic element cannot be safely admitted to form one of the resources of the artist, without much reserve and discretion, is a truth but rarely disputed; the mere buffoon, the coarse caricaturist, are indeed not entitled to the name of artist, and soon find themselves reduced to their true level. Altogether different is the condition of him with whom that element is but one among the many which go to form genuine humour. The place appointed to the possessor of this "subtle quality" in the temple of Art may not be among the highest, but he holds it by imprescriptible right, nor is it one that may be justly disdained.

For the humourist, whether in Art or Literature, is one of the born instructors of his kind, and not the least efficient among them. Shrewd are the blows that he levels against vice, when it dares to come before him in its turpitude; keen the shaft aimed by his hand at the follies of the time, and unerring the touch wherewith he raises the veil of Pretension, whatever form the Protean goddess may assume.

* "And now there came, o'er the perturbed waves,
Loud-crashing, terrible, a sound that made
Either shore tremble, as if of a wind
Impetuous, from conflicting vapours sprung,
That 'gainst some forest driving all its might,
Plucks off the branches, beats them down, and
hurls
Afar; then, onward passing, proudly sweeps
Its whirlwind rage, while beasts and shepherds
fly."—CARY.

If considered principally in reference to certain of his fables, La Fontaine may be justly classed among humourists, and the grace as well as good-humour with which he laughs at follies that do not call for more severe repression, are admitted on all hands. Hear him, as he amuses himself with the dear little foibles of personal vanity, for example:

"Eh! bonjour! Monsieur du Corbeau!
Que vous êtes joli! que vous me semblez beau!
Sans mentir, si votre ramage,
Se rapporte à votre plumage,
Vous êtes le Phœnix des hôtes de ces bois!" &c.

We all know the rest, but how shall we render the charming playfulness of these lines? the "impayable" Monsieur du Corbeau? It is by no means to be done, the attempt is hopeless, but there is a dash-at-all Irishman of our acquaintance who would certainly not hesitate to give his version of the passage, and it would not be much unlike that in the note below;* for we won't admit it into the text. How the poor crow came to grief because of these sweet words, none will have forgotten. We all remember, too, the portraits taken of this Monsieur du Crow; there is room for another, nevertheless, and here is one, which, if it have no other merit, will at least serve us as the pretext for an exquisite morsel of woodland beauty, in the landscape you may learn for the habitat of your personages.

The fateful words have been spoken; they have produced their effect. Mr. Fox has caught the dainty prize before it has well touched the ground, and is taking his pleasant way along a sweet sun-lighted wood-path, his handsome brush sweeping with a proud complacency over the soft green turf. The figure of our bereaved O'Crow is much less triumphant; his amazement has not yet left him at leisure to close those musical lips that have worked his woe; and the aspect with which he regards his retreating despoiler is not a dignified one. On a high branch, far above the head of the crow, sits a saucy squirrel, eating his breakfast of nuts, with every appearance of satisfaction: he is bestowing the shells full upon the head of poor Sir Patrick; let us hope they are falling by accident, or it might be supposed that he was laughing at the evil plight of his neighbour.

All who love to contemplate beauty of form, and delight in the fervid tones of Italian colour, will ever rejoice in the successful transmission of both to their canvases by so many of our distinguished artists; but let not the Peasant of the Abruzzi, however picturesque his figure, nor the Contadina of the Campagna, radiating as is her glance, bear off all the honours of their notice. A bright and glowing scene is the Wine-harvest, but it does not monopolise the poetry of the fields, and although much of the romance of rural labour in our own fair land has doubtless been destroyed, yet there still remain some lingering relics of old custom in remote districts, and these occasionally offer a spectacle not unworthy of the painter's eye.

In certain parts of Holderness, for example, the last load of the wheat-harvest is still brought home amidst songs of triumph, and with rude garlands of field flowers suspended from various parts of its huge mass. Boys, and the younger labourers, dance merrily beside the gaily decorated load; their exultation ever and anon bursting forth in the following words, which are used with slight variations, in all the villages where this primitive custom still lingers.

"We hev her! we hev her! †
Oor last eart's i' tether,
Sae gin us a coo,

* "Now the top o' the morning! Sir Patrick O'Crow,
Faith! 'tis handsome you are! sure! the broth
of a beau!

If you sing as you look,
We may seek high and low
But we'll not find your equal, Sir Patrick
O'Crow!" &c., &c.

† The attribution of the feminine gender to things inanimate, in these regions, is sufficiently amusing. The clock, the oven, the kettle, and many another of the good wife's household belongings, are thus distinguished, her husband calling his watch "she" in like manner.

Or 'tis nobbut * a lamb,
For ye see we eom seaf
Wi' oor harvest yam, †
At oor toon end, at oor toon end,
We've a soop o' good yal, ‡ and we've mooney §
to spend,

Sae coome big and little,
Sae coome yan and all,
Ye'll get yal and get apples,
Whats'ever befall."

The "coo" is no longer expected, nor is even the lamb forthcoming in these degenerate days; but a gift of apples is made ready for the boys by every cottager before whose dwelling the auspicious procession takes its way. That the cereal and floral games of the ancients have been the origin of these now dying customs, is manifest, but with this question we are not, for the moment, concerned. If the artist will admit that they may present subjects no less worthy of his pencil than the broad-fronted buffalo, and more fragrant load of southern climes, many a charming picture, never yet painted, may rejoice the eyes of the beholders, while it rescues from oblivion the last trace of national customs, now rapidly falling into disuse.

From a Georgic to Bucolics the transition is not violent, and here is a remark of that accomplished gentleman and eminent agrarian authority, the late Thomas Gisborne, which may give our incipient Paul Potters rare occasion for glorifying the never-changing youth which their own chosen walk of Art may truly boast.

Gisborne, in his *Essays on Agriculture*, is describing, with a most engaging geniality, on all that Mago the Carthaginian set forth, some good dozen of centuries since, as to the merits and attractions of a thoroughly handsome ox. These are the words of Mago, which Gisborne, loving his author for the sake of those loving beauties, whose charms the Carthaginian chronicled so long ago, "will not accept," he tells us, "in the German of Heeren, or the English of Dickson," but renders them, and to the letter, for himself. The translation is as follows:—

"The young oxen we buy should be square in their form, large limbed, with strong, lofty, dark-coloured horns, broad curly fronts, rough ears, black eyes, lips prominent, and expanded nostrils: long and brawny neck, ample dewlaps, pendant nearly to the knees, a wide chest, large shoulders, roomy bellies, with well-bowed ribs; broad on the loin, with a straight, level, or even slightly depressed back; round buttocks, straight and firm legs, by no means weak in the knee; large hoofs, very long and bushy tails: the body should be covered with thick short hair of a red or tawny colour, and they should be very soft handlers." ("Tactu corporis mol-
lissimo.")

"A very tidy ox!" adds Mr. Gisborne, "whether purchased in Libya, by Mago the Carthaginian, 600 hundred years before Christ, or in our own good county of Northampton during this current year of 1852." He subsequently tells us that his Mago—for there were more than one of the name, as all will remember,—discoursed thus eloquently, and to the purpose, on beeves, in the time of Darius Hystaspes, and was the founder of that great Punic family whence Hannibal claimed descent.

Let, then, our young Paul Potters,—offering due allegiance also to Paul's worthy contemporary, Cuypp,—take a goodly herd of such oxen as the Carthaginian has here depicted; let him give them to rove at will in such pastures as his heart best loveth to paint, and he shall cause the excellent Albert, not less than dear Paul to smile approvingly as they give each other a cordial shake of the hand, in that bright painter's elysium, amidst whose fair broad uplands, fitly browsed by well-shaped flocks, they now expatiate together.

Like Gisborne and the Carthaginian, a dear lover of all that peoples the field, the present writer has just taken counsel with another eminent "judge of fat cattle," to say nothing of lean, or of such as are neither fat nor lean—and this authority likewise upholds the correctness of the Carthaginian model, save only in the article

* 'Tis uobbut—if it be but.

† Yam—home.

‡ Yal—ale.

§ Mooney—mooney.

of horns, which, as he sayeth, should not be black, but white, seeing that the last-named colour is now "your only wear." Let the student make his election, but in any case let him give us the cattle and their pasture; the horns he shall make of such colour as may best please him.

"Gli occhi tuoi pagheran, se in vita vesti,
Di quel sangue ogni stilla un mar di pianto." *
TASSO.

These words—their vengeful import intended for the king, Louis XIII.—to whose ears they were quickly repeated by the enemies of the unhappy speaker, are declared to have burst from the lips of Eleonora Galigai, when the mangled corpse of her husband, Concino Concini, was laid before her. Whether Louis XIII. were thus menaced by the bereaved woman, in her frenzy, or not, the fate of Eleonora had certainly been decided on when that of Concini was determined; nor can this be doubted when we remember that the crime of which her venal judges pronounced her guilty, was that of witchcraft, an accusation manifestly invented, for their purpose, by the destroyers of her husband. For this she was condemned to the bitter death of the stake, and did in fact suffer on the Place de Grève—but by the more merciful process of decapitation—some few weeks after the murder of Concini.

More than one mournful story here awaits the hand of the painter; and if it be true that the grievous tragedies alluded to are already familiar to all readers, yet let the hand of the artist make them known to a yet wider circle of disciples, seeing that the lessons they convey are significant, and have proved useful to more classes than one.

There may indeed be some who are still unacquainted with this deplorable episode of French history, and we therefore add the few words required to give its outline.

When Maria de' Medici entered France as the bride of Henry IV., she was attended, among others, by Concino Concini, whose father, originally an obscure notary, was then high chancellor to the first duke of Tuscany.† At the French court, Concini married Eleonora Galigai, a woman whose origin was yet more humble than his own: she was indeed the daughter of a woodcutter and a washerwoman; but talents and qualities of various kinds had raised her from the condition of a menial to that of first lady of the bedchamber.

After the assassination of Henry IV., and when Maria de' Medici was declared regent of the kingdom, this couple became the virtual rulers of France. But if Concini did not find means to repress the disorders that prevailed, neither was he the origin or promoter of those disorders. The depravity in things public, so justly complained of, was not the cause; it was but the pretext of his downfall. The hatred of that party, at the head of which stood the Prince de Condé, whose instrument De Luynes, the king's favourite, was not less ambitious than Concini himself, was the true source of the Italian's ruin. But we enter into no details: let it suffice to say that Concini—at this time known as the Marshal D'Ancre—was murdered with the consent, nay, under the very eyes of the king, as he was entering the Louvre to wait on that unworthy monarch; and that his wife, awakening from her dream of greatness, was conducted as above described, to a death—not merited very certainly for the crime it was declared to expiate—by the hands of the common executioner.

The few words by which Eleonora Concini repelled the accusation of sorcery, when standing on her mock trial before the Presidents of the Parliament of Paris, are in the recollection of all, and need no repetition. She left a son, not more than sixteen years old, and this boy, having been dragged by an infuriated mob to the windows of his devastated house, was com-

pelled to look on, while the body of his father, first laid hastily in a grave at St. Germain L'Auxerrois, but torn thence by the populace, was suspended on a gallows raised for that purpose. The life of the boy was saved, but not until he had been so roughly treated that every part of his clothing was torn to shreds. A cloak was then cast around the insensible youth by one of the spectators, more compassionate than the rest, who rescued him by declaring that he was already dead, and conveyed him, while yet unconscious, to the Louvre.

What follows will not be credited without difficulty; it is true, nevertheless, and may serve to show of what stuff was made that mistress for whom Concini offered the sacrifice of his life, for it is well-known that he might easily have escaped to Italy after his danger had become obvious—had he been willing to abandon the queen to those who were her enemies no less than his own. The son of Eleonora, carefully educated in the luxurious court of France, was remarkable, among other accomplishments, for the grace and beauty of his dancing: this was known to Maria de' Medici, and, with the tears of sorrow for his parents still dimming his eyes, the terror he had so recently endured yet blanching his cheek, the hapless orphan was called on to exhibit his proficiency as a dancer for the amusement of the queen, and, with his breaking heart, was thus compelled to minister to the idle pleasures of her train. He died at Florence, in the year 1631, and with him perished the short-lived greatness of his house.

The death of Gustavus Adolphus, at the Battle of Lützen, has been amply discussed by writers, nor has it been wholly neglected by the painter; but there is still place for a fair delineation of that event, which yields in importance to few that occupy the historian, and has more than sufficient interest for the poet, whether painting or song be the muse of his invocation.

The great defender of the Protestant cause, and "one of the best men that ever wore a crown," Gustavus Adolphus, excelled in bravery, as in every other high and noble quality. At the Battle of Lützen he led the attack, and is indeed affirmed to have been the first who dealt a blow on that inauspicious day. He was heading a second charge, and had borne down all before him, when the hand of treachery effected that to which the force of Austria had proved unequal. Francis Albert, Duke of Saxe-Lauenburg, the cousin of Gustavus, is accused of his murder by the concurrent testimony of his contemporaries. He was close to the king at the moment when a ball, coming from behind the latter, entered his back, and he fell dying from his horse. A German noble, the creature of Francis Albert, is said to have been also near Gustavus, and the traitorous shot has been attributed by some writers to his hand; but the author of that dark offence was, without doubt, the Duke of Saxe-Lauenburg, whose subsequent defection from the Protestant cause and the welcome he received into the Austrian service, which he soon after entered, leave no doubt of his guilt.

That victory, nevertheless, remained with the Swedes, our readers will remember; this was due to the heroic efforts of Bernhard, Duke of Saxe-Weimar. He dashed into the ranks of the enemy, calling on every true man to aid him in the rescue of their monarch, whom he declared to be a prisoner in the hands of the Austrians. The impetuosity of his attack proved irresistible, Austria was defeated with fearful slaughter, but, thanks to her treachery, the grieving Swedes bore only the lifeless remains of their beloved monarch from that dearly-won field.

The painter who shall select this theme will treat it all the more justly as well as effectively if he adorn his canvas with the animated figure of Duke Bernhard. The omission of this would indeed be a violation of historic truth, as well as a mistake, whilst its introduction would supply the artist with a *point* in the composition, which, if successfully carried out, would, as we have just said, tell most effectively in a picture.*

THE ROYAL PICTURES.

THE BAY OF NAPLES.

W. Callow, Painter. R. Wallis, Engraver.
Size of the Picture, 2 ft. 5½ in. by 1 ft. 8 in.

NAPLES is a favourite *point d'appui* with our travelling landscape-painters who visit Italy; occupying, as it does, one of the most beautiful situations that can be conceived; built in the form of an amphitheatre, surrounded almost entirely by ranges of lofty verdant hills; and washed by the dark blue waters of its noble bay, the city and its environs present just such features of picturesque composition as an artist likes to have before him. From whichever side the view is taken, whether from the east or west, the high ground of Capo di Monte, at the back of the city, or the surface of the bay at its feet, he is certain to find subject-matter for his pencil of the most delightful character, wanting, however, that which, to the eye of an Englishman especially, constitutes one of the greatest charms in nature, the rich and clustering foliage of extensive woodlands: it is the absence of this feature which gives to the scenery of the country round about Naples, particularly in the summer time when the herbage becomes dry and parched, a barren and somewhat naked appearance. Still, with this drawback,—

"not a grove,
Citron, or pine, or cedar; not a grot,
Sea-worn and mantled with the gadding vine,
But breathes enchantment. Not a cliff but flings
On the clear wave some image of delight,
Some cabin-roof glowing with crimson flowers,
Some ruin'd temple or fall'n monument,
To muse on as the bark is gliding by."

Mr. Callow's picture was purchased from the Gallery of the Water-Colour Society, by the Queen, on the occasion of her private visit in 1852. It represents a distant view of the City and Bay of Naples, from the western heights, and onwards over the wide level plain that lies between the city and Vesuvius, distinguished by the column of smoke rising from the peak. The treatment of the picture indicates early morning; the atmosphere is cool and clear, every object is distinctly visible through its transparency; the bay, calm and unruffled, reflects the soft blue of the sky, except when the rising sun throws a long pallid light on its surface. The foreground of the composition is occupied by one of those "cabin-roofs glowing with crimson flowers," to which the rays of the morning sun give increased brilliancy. The lofty tree to the left, though not sufficiently picturesque to satisfy the eye of an Englishman, accustomed to the majestic oak and noble elm of his own country, gives importance to the composition, and assists in throwing back the middle and extreme distances.

There are certain scenes—and this is one of them—which offer ample scope for meditation to those who, looking at a beautiful landscape, find something in it to engage their thoughts beyond the outspreading of the luxuriance of nature. A man of reflective mind, standing on the spot where Mr. Callow must have stood when he sketched the subject, could scarcely fail to place in juxtaposition the living city, almost at his feet, and the "cities of the plain," at no great distance from it, so lately restored to light from the darkness of centuries. "Naples," says Mr. Forsyth, "in its interior has no parallel on earth: it is a city teeming with life of the most complex and varied description;" splendour and squalid misery, in appearance, joining almost hand in hand, or at least jostling each other through the thickly crowded streets. Less than an hour's ride by the railroad—for the hoarse screech of the steam-engine is now echoed from the sides of Vesuvius—carries the traveller to the cities of the dead—to Herculæum, where Cato's sister lived in the villa presented to her by Julius Cæsar; and to Pompeii, where Cicero, and Seneca, and Phædrus had their homes, and whose walls were encompassed by the legions of Sylla. In short, the whole country teems with the memories of past greatness, associated with the grandeur and glory of ancient Rome.

The picture is in the Royal Collection at Osborne.

* These lines may be translated—if not quite literally, yet with sufficient closeness—by the following—

"For each dear drop poured from his veins this day,
Thine eyes a sea of bitterest tears shall pay."

† See Litta, "Famiglie celebri Italiane," Roma, 1829.

* To be continued.

W. CALLOW, PINX.

THE BAY OF NAPLES: EARLY MORNING

FROM THE PICTURE IN THE ROYAL COLLECTION

LONDON: PUBLISHED BY G. & C. B. BODLEY, 1850.

THE EXPOSITION GENERALE OF 1855, AND ITS CLOSE.

WHILE, with the old year, we take our leave of its *Exposition Universelle*, in both Fine Arts and Commerce, we do so with one brief final comment upon its closing scene, and the judicial decisions, which may be taken to direct its ultimate

results. In connection with these, as referring more immediately to the Fine Arts, we here offer to our readers a statistical table, formed with some care, in which they will be able to learn, almost at a glance, the names of the different states which contributed to the teeming contents of the *Palais des Beaux Arts*; the number of artists by which each was represented; the number of their works in separate departments and in the aggregate; the honours dis-

pensed in the several classes; and, in addition, the nearest proximate proportion between the gross amount of the latter, and of the works sent in. A moment's considerate inspection will avail more than the most precise description towards enabling those whom it may interest, to estimate the facility thus afforded them of learning at present, or on any future retrospective reference, these various statistical incidents:—

In this review, from the units of Mexico and Java to the thousands of France, will be found an unparalleled artistic congress. France, it will further be found, has, in quantity and variety, had the advance over all, and might be taken, in the result, to have established for herself a pre-eminence as an *officina* of artists and Art. The times for this comparative meeting were not only *not* out of joint for her exhibition of power in this quarter, but in a directly opposite condition, of firmness and strength. Her generation of artists has never, probably, been more prolific than at present; and, as a school of Art, in every class, her tone most assuredly has never been so high.

It will be seen from our table, that while the total number of works of every kind sent in to this Exhibition amounted to 5078, her portion thereof, *i. e.*, 2730, was more than what came from the other six-and-twenty contributing nations. Her great rivals in the highest range of Art, the Prussian and Bavarian fresco painters, could not, *ex necessitate*, join the noble tournament. In their panoply they could not invest themselves; they could but enter the field in the imperfect equipment of their cartoons, and so they withheld. Cornelius and Kaulbach, who, trusting to their great names, took the other course, can scarcely be said to have done so discreetly. The cartoons of the former, for the fresco illustrations of the Campo Santo at Berlin, were not calculated to enrich the wreaths of his well-acquired laurels. They presented, in their sublime and exacting subjects, something too much of an unfelicitous contrast of weakness and exaggeration—mingled, however, with unequivocal emanations of the great master mind. Our own impressions on this nice point, were confirmed by the deep regrets expressed to us by one who, amongst the first, does honour, as an old pupil, to the studio of Cornelius. It is much to the credit of the Fine Arts Jury of this department, that they did homage to the already

acknowledged creative genius of this first of contemporaneous sons of Art, and awarded him their highest honours. The name of Cornelius, by a happy alphabetical accident, stands first in the *élite* to whom the *Grandes Médailles d'Or* have been assigned.

While France, under the stimulus of the great occasion at hand, which, moreover, involved the interests of her annual exhibition, guided by zealous, active, intelligent, and experienced managers, poured the full tide of her artistic power into what must be considered a confluence of competition, it is to be doubted that an equivalent agency operated in favour of the stranger comers from all quarters. Whether or not it was anticipated that this was to be a field of contest and trial, it is needless to ask—the fact is, that there was not, on any side, amongst the *externes*, that appearance of emulative effort, which, it must now be felt, was but expedient and for their full credit.

We much apprehend that our own school was not unaffected by this misadventure. At another time, we might have sent a stronger force of men of genius to sustain our honour in the severe *mêlée*. Now, we have not one to spare, while France had scarce reason to feel the absence of her Scheffer and De la Roche. Neither was there the same glorious response to the call that was made upon our body of artists. In painting, something of misapprehension, something of doubt, and something of indifference, may have chilled their emulative efforts. Probably, a still more effective and less untoward cause than these may have been found in the disrelish of owners to part with favourite works, and submit them to possible casualties against which no insurance could be held satisfactory. This, it can be easily felt, must have been especially operative in the case of sculpture. We had, in that department, too few of those masterpieces in marble, upon which time has set its stamp; and it is impossible, even with educated

eyes, for the plaster cast to compete with either bronze, or Parian, or Pentelic. In the distribution of honours, it will be found that in this department we were comparatively least successful.

Looking, nevertheless, at the statistical table, it will be perceived that, upon the whole, the number of honours awarded to the British exhibitors was, although less, not so by much, than that to the French. In the class of painting, we had 381 works and had 34 honours, or about the 11th part. The French, in the same department, had 1870 works and honours 157, or about the 12th part.

In sculpture, we gave a range of 77 works, and had but six honours, or a 13th, as near as may be. The French had 386 works and 62 honours, or a proportion of 1-6th. The adverse proportion in this class was, to use a moderate expression, *aggravated* by our honours being all in the lowest category.

Our engravings, including lithographs and woodcuts, numbered 199, our honours 8, or about a 24th part. The French had 286 works of the same class and 21 honours, or about a 14th.

In architecture, there were 128 British works and 15 honours, about an 8th. The French had 188 works and 48 honours, about the 4th.

Making a total—we had to 785 works of all classes exhibited, 63 honours, or a 12½th part.

The French had 2730 works, and honours 288, or between a 9th and a 10th part.

Belgium, it will be perceived, had a higher proportion of honours, viz., a clear 9th, than either France or England.

Prussia also had some advantage over us—her prizes being in the proportion of an 11th.

In a general point of view, then, there seems but little reason for dissatisfaction at the distribution of honours. Exception, we doubt not, will be taken to many detailed and relative arrangements of merit; and most assuredly, in looking over the long array of the honoured,

some strange and unnatural transpositions and repudiations must startle those familiar with the well-understood precedence of parties here at home in England.

There are, however, some of the awards, and some of what we fancy must be termed the slights, of this jury, against which it is impossible for us not to enter our strongest protest. To pass them *sub silentio* would be a mistake. And first, their understood resolve to withhold the higher honours from Mr. Mulready, which led to the sound and spirited proceeding of our commissioners to withdraw his name from competition. While we reclaim what was due to Mr. Mulready, let us guard ourselves against any supposed or intimated canvas as to his and Mr. Landseer's relative merits. The latter has well won his latest honours; and he too has had a long trial before the tribunal of his country's opinion.

It would be idle for us to enter here into an analysis of the merits of Mulready. They are too familiar to all, on this side of the Channel, to allow such a proceeding to be other than a work of supererogation. We shall, however, call into evidence two out of the many French critics (not members of the first jury in *Les Beaux Arts*), who have put his name through their crucible, and brought it forth with first-stamp of metal. We here repeat that notice, which appeared in the *Moniteur*, and which we have already, in our number for October last, presented to our readers. "Mulready," says the critic, "enjoys, in England, a reputation with which we have been familiarised by engravings. To know him, however, it is necessary to have seen his original works, which reveal rare qualities in both tint and treatment. This master—and he deserves the title—has seven pictures in the Universal Exhibition, which hold a place of honour amongst the best of all countries. It is remarkable that each of these is treated after a different manner—often in strong contrast—so that a forewarned attention alone could recognise in them the same hand. Many artists, too readily content with their efforts, repeat themselves from the beginning to the end of the chapter. Mulready, ever searching forward, studies, toils, and experimentalises; not impressing his works for ever with the same character. * * * * It would be difficult to associate this artist with any of the old schools; for the character of English painting is modernness. It is obvious that, like Wilkie, he has profoundly studied Terburg, Nestcher, Metz, Mieris, Gerard Dow, Ostade, Teniers, Breuer, Bega, Craesbecke, and all those charming painters of Holland, whom the fastidious taste of Louis XIV. repelled. But he has not copied them. He absorbs them, and nourishes his own genius with their essence—without being transformed."

A critic of higher name and authority than Mons. Gautier, Mons. Maxime Du Camp, thus, in his masterly and popular volume, "*Les Beaux Arts à l'Exposition Universelle de 1855*," gives his estimate of Mr. Mulready. We transfer it in its original vividness and force:—

"L'homme le plus fort que consacre l'exposition britannique, celui qui domine tous ses confrères de la hauteur d'un incontestable talent, est, selon nous, M. Mulready, artiste populaire en Angleterre, et qui, par quelques-uns de ses tableaux, laisse loin derrière lui la plus part des peintres de genre français. Ses personnages, animés et bien en scène, sont tout à leur affaire; ils vivent et ne posent pas; ils sont dans la réalité de leur mouvement et de leur action, et ne ressemblent pas à ceux de M. Meissonnier, qui paraissent toujours avoir mis des habits neufs et prendre des attitudes particulières pour se faire regarder par les amateurs. La peinture de M. Mulready ne rappelle en rien cette peinture endimanchée. Elle est vive, sincère et sérieuse, et n'a d'autre préoccupation que de représenter la vérité."

A little further on, M. Du Camp, speaking of Mr. Mulready's exquisite picture of "The Bathers," expresses, in his own piquant mode, the opinion, that probably the power of depicting delicate flesh tints was never carried so far.

"Mais disons aussi que jamais, peut-être, on n'a été aussi loin dans l'imitation de la carnation humaine, de ces nuances fraîches et nacrées, douces et charmantes, que le diable prête à la jeunesse pour en faire sa beauté."

We accept these attributes of wondrous variety of style—this genius, nourished by the very essence of the great Flemish school—this leadership, much in advance, of the British exhibitors—this distancing far the great majority of the French painters in *genre*—this matchless flesh-tinting—this life and sincerity of treatment, as contrasted with the posed, *Sunday-suited* mannerism of Meissonnier, and we venture to affirm that a sound and just decision should have placed the name of Mulready, if not before, at the least, beside that of the French master named, in the class of "*Grandes Médailles d'Or*."

If with the most serious mood, we note this error in regard to Mr. Mulready, the same feeling almost lapses into laughter, when we find how the merits of Mr. Danby have been appreciated. He too is one of those artists, whose fame is not of yesterday—is no longer ambiguous. From the days, now long since, when Sir Thomas Lawrence, with a glowing recognition of the young artist's genius, made himself master of one of his first poems on canvas, "The Raft," and gave it a unique place of honour in his painting-room, down at least to the time, when the two works, exhibited here in Paris, "Calypso Lamenting the Departure of Ulysses," and "The Evening Gun," were sent from his easel, the reputation of Danby has ascended to its culmination without a cloud. On looking back over the series of works, which he has given to the public, and extending our retrospect to the great names that have distinguished landscape Art, we do not feel it too much to hazard the affirmation, that his has been the most thoroughly and purely poetic pencil of the group. His, too, has been not alone the "feeling and the faculty divine" of appreciating and giving to the canvas the loveliest and most striking effects of nature, but he has fully enjoyed the accomplishment of Art which enabled him to do it with the most refined delicacy of touch and firmness of effect. These qualities are all to be found in the "Calypso" and "The Evening Gun." The latter has been the chief favourite with the French critics. Of it, the representative of La Patrie, who cannot be accused of the weakness of a leaning towards English arts or artists, says,— "It is impossible better to convey the impression of the undefined vastness of the sea, or a calm summer evening, just when the last rays of the sinking sun fringe with gold the clouds that gird the horizon. A deep shadow already wings its way across the waters, and a ship—the burst of smoke from the porthole of which tells the discharge of the evening gun—shoots up with the clear sky, the regular skeleton of its masts and yards. The ship seems to sleep upon the waters, like the vague silence brooding over it. The 'Evening Gun' is a picture, the poetry of which is perfect from its truth. We are not surprised that it should have been considered a *chef-d'œuvre*."

Again, the *Moniteur* thus harmonised with its contemporary:—"Mr. Danby's 'Evening Gun,' is, in one word, a *chef-d'œuvre*. One could scarcely imagine a picture so poetical. There is in it a tranquillity, a silence, a very solitude, which leaves a deep impression. Never has the solemn grandeur of the liquid element been more touchingly expressed."

Monsieur Maxime Du Camp coincides. In his notice of English art, at large, after having condemned in it the over-elaboration of details to which he considers sentiment and general effect to be sacrificed, he thus educes Mr. Danby's "Evening Gun" as a marked exception. We give but the opening and concluding sentences of his critique, the intermediate portion being but an elegant description of the scene depicted.

"Tous ne sont point ainsi cependant, et quelques-uns ont su marier dans une belle mesure l'exactitude de la facture et la largeur de sentiment; nous citerons comme exemple, Le Canon Du Soir de M. Danby."

He thus closes:—"Il y a dans cette composition une poésie réelle, qui réjouit d'autant plus qu'elle est peu commune dans les productions de l'art anglais."

Let us now, before showing how the jury of the department of painting in the *Beaux Arts* have dealt with Danby, make known their judg-

ment on a French artist who pursues the same route, the poetic, *longo intervallo*;—we allude to Monsieur Gudin. Five-and-twenty canvases of this prolific hand stretched many a rood over one quarter of the Palais. They all presented imaginative effects in and on all the elements; but their prevalent treatment was crude and of the scene-painting school. This can be more easily understood when it is stated that when, in Louis Philippe's time, the walls of Versailles were to be covered with epic in a *clin d'œil*—the work of a century, or more, to be improvised in a day—to M. Gudin was entrusted the throwing-off of the historic glories of the French navy.

In reference to his merits Monsieur Du Camp thus writes:—

"At the present day there are but four marine painters in France: M. Courdoun, who has talent; M. Morel Fatio, who has none; M. Ziem, who has still a portion left; and M. Gudin, who is exhausted. Like a child that, changing a *louis d'or* for a lot of copper, thinks itself the richer from the increase in the number of its coins, so M. Gudin, who might have produced some twenty commendable pictures, has preferred associating his name with five hundred that are bad. He is at this moment irremediably lost, and I know not whether some of his earlier works, upon which he has piled up such a mass of mediocrities, will suffice to rescue him from oblivion."

How then have the jury disposed of Gudin and Danby?

M. Gudin has all the honours of the *first class medal*! But, Danby, has he been crowned with those still higher?—By no means. Has he then been made the colleague in *Class I.* with M. Gudin and some forty-eight others?—No. He joins, then, some fifty-one in *Class II.*?—No. In *Class III.* with its illustrious fifty-seven? Again,—No. In a word, Mr. Danby, with all his merits on his head, was flung over into the *mêlée* of mediocrities, 157 in number, who are consoled or blest with the word *Mentions Honorables*. Is it not ludicrous? or, as says the classic satirist, *Risum tenentis—amici?*

Strange as this parvipending of the poet of our painters may be, it is not more so, than the total omission of Mr. Linnell's name from any one of the five lists of the medallists, or the honourably mentioned. In his works we have been accustomed to recognise a vigour and a freshness allied to, without imitating, some of the best of the old golden times. In one small landscape of his five exhibited on this occasion, these in both colour and handling were finely concentrated. Mr. Creswick's admirably painted picture of "Passing Showers," was a faithful and finely worked-up reflex of nature, from which the French landscape painters, who, as has been fairly avowed by their own writers, owed to the English School a reformation from dry artificial style to something akin to reality, might, even in these, their palmy days, have taken a useful hint, was wholly ignored. We cannot accept the award. Nor, again, its repetition in the cases of Cope, Dyce, and Herbert. The French critics have, in their notice of the *Beaux Arts* on the late occasion, affected a facetious surprise at the abnormal novelty of the British School of Painting, and they would seem to have communicated the spirit of their jest to the gentlemen of the jury. This alone would make us notice the absurd *jeu d'esprit*. Of the idiosyncrasy of the British School we are willing to make Mr. Mulready the test, who brought the vigour of an untrammelled genius into communion with the great spirits of the by-gone times, and while he toiled unweariedly to emulate their excellence, never sacrificed his own originality. If he differs startlingly from Meissonnier, it is no more of a perplexing contrast than that of the delicate effeminacy of the same Meissonnier with the rugged mastery of Rembrandt. It assuredly is not the originality of our artists, with which we shall quarrel—whatever other sins they have upon their heads. Better the freshness of their independence, which gives us at intervals such men as Hilton and Wilkie, Calcott and Turner, Mulready and Danby, than that they should be schooled even in the studios of Paris, to be the tenth transmitters of some great old masters' worn-out style.

Something of the same feeling on the part of French critics and artists in reference to British sculpture may perhaps account for the discretion of judgment which gave the name of MacDowell to the fourth class, or *Mentions Honorables*, in company, to be sure, with the only other five British sculptors, who have the honour of a recognition in the late *concours*. Mons. Maxime Du Camp is one of those bold thinkers in France, who dread the utter decay of sculpture from its ever straining after the Greek model, which was no artificial elaboration, but the spontaneous emanation of a peculiar time, a peculiar people, and peculiar, long-abandoned modes of life. He feels that the art should aim more strenuously than it has done at a sympathy with the present period. If any works have come from marble which might be said eloquently to illustrate this theory, they are those of MacDowell. "The Girl reading," and "The Girl preparing for the Bath," which were in the late Exhibition, were fine examples of the new school. They unite exquisite beauty of expression with lovely form, familiar grace, and a most delicate elaboration of drapery. That these should have been disparaged into a fourth class, while in Class I. is placed what is little better than a copy of an antique dancing fawn; and in Class III., a bust by Count Nieuwerkerke, one of the jury, and moreover Director of the *Musées Impériaux*, seems to us, in the full meaning of the well-known emphatic comment "too bad." That the "Ulysses" of Macdonald, the "Boy at the Stream" of Foley, the "Beatrice" of Hancock, to say nothing of Bailey's "Even," and Gibson's works, were not estimated as they merited is much to be regretted. On the other hand, it was gratifying to find a public recognition of the beauty of Lawlor's statue of "The Bather," which was exhibited in Hyde Park in 1851, without, we fear, being thoroughly appreciated. It is a work that ought to be the forerunner of many fine things. Would that it had been seen here in the marble!

Let us not conclude without expressing our hope of having fairly estimated the vast interest which the late *Exposition Générale des Beaux Arts* was entitled to claim. It was wholly unprecedented, and realised a congress of art of wonderful extent, and unanticipated attractions. It was a revelation, on the whole, most satisfactory, of the state of Art, and the merit of artists throughout Europe, and a trifle beyond. It was well calculated to excite a noble emulation, and give a great general impulse to the progress of the one and the estimation of the other. It was a first experiment, and had defects and defaults, such as might have been expected under the circumstances. Let us hope that, at no very distant period, a repetition may be undertaken with more completeness of organisation, a more even balance of direction, and less ground for the untoward excitement of jealousy. Even at the best, there must be found some alloy to the great sterling ore of which, on such occasions, we become partakers. Still—even still, as in days of Horace, his words are but too true,—

"Nil est ab omni
Parte beatum."

CORRESPONDENCE.

To the Editor of "THE ART-JOURNAL."

THE MEMORIAL OF THE GREAT EXHIBITION OF 1851.

SIR,—New that we are beginning a new year, and the stores of manufacture and the marvels of industry are moved, or on the move, out of the Great Paris International Exhibition; and the monsters of machinery have been taken piecemeal—bone from bone, and limb from limb in the annexe; and the pictures and the sculptures are packed up and nailed down in their temporary coffins for transit to their homes; and the plaster palace of the Beaux Arts is about to subside into its primitive elements and "leave not a wreck behind:" and now that the other exhibitions, also international and universal, have had their day and are past; and the cycle of universal international exhibitions may be said to have performed its orbit and its mission for a time, and a lull has taken place in such matters, which is likely to last at least some

few years—is it the time to forget what the Persian would call "the grandfather of all the great international exhibitions?" I mean, of course, the Great British Exhibition of '51; which, working its way, as it did, wholly without precedent through unexampled and unexpected difficulties, yet has been the only one thoroughly triumphant. Never did an expedition reach port safely through a greater series of dangers than that scheme of '51! Recks and shoals of all sorts lay in its way, and yet miraculously it escaped all these dangers, manifest or hidden, and came into port with a full cargo and plenty of passengers—to the very day appointed—with the royal flag at the main! Is this, I say, the time to forget the Great Exhibition of '51? or is it not rather the time most particularly to remember it?

That scheme, so successfully carried out, will always remain an historic fact of great interest and of great honour to these Isles. With all the advantage of it as an example, its children in Dublin and America, and lastly, in France, have sought to imitate and surpass it; but in vain; and it may be said to be like what Milton says of our first mother,

"The fairest of her daughters, Eve."

Having now likened the Great Exhibition of '51, firstly, to a grandfather; and secondly, to our first mother, I have certainly gone far enough in hyperbole, and will come precisely to what I mean! and the subject of this is, the *Memorial* of the Great Exhibition of '51, which, after the close and removal of the building was proposed and set afloat, and for which a large number of subscriptions were received,—but of which we have not heard one word for a long time, at least I have not, and I was a subscriber of my mite in aid of what I thought a worthy project. I have just been refreshing my mind with respect to it, by reading an article which appeared in the *Art-Journal* of last year, and find by it that at the time it appeared, viz.: July, 1854, (that is, nearly a year and a half ago) a large sum had been at once subscribed. "7,000*l.*" the article says, "flowed into the hands of the committee of the Memorial without much effort on their part." The article, in addition, contains some remarks in which it combats a diversion, that was suggested, of the funds to another purpose. With these remarks I quite coincide; for if we are to have public memorials at all, what subject can we better choose to celebrate, than the great commercial, historic, artistic, and friendly event in question? "If good deeds," you say, "and great events, having a lasting influence on the condition of large communities, are worthy subjects for public historic memorials, then was the project for erecting in Hyde Park, on the site of its existence, an historic and artistic record of the International Exhibition, an appropriate and worthy thought."

It is a natural question after this lapse of time, what is the fate of the project? To which may be added, and what have become of the subscription? The space formerly occupied by the exhibition is now a broad open green sward in Hyde Park, close to Kensington Gardens. There is no artistic decoration in either of those places besides the *Achilles*, except perhaps the Coalbrook Dale iron gates that were given to the crown by that firm. Not a specimen of Art besides these is visible within those beautiful pleasure grounds which in any other country would long ago have been enhanced, not only with vases and mere decorations but with artistic works of a high class. Could we begin then with anything of nobler association than a suitable record of the Great Exhibition?—people ask, "Where was the Great Exhibition?" No doubt there should be something to show them where it stood—say, on the spot occupied by the centre of the building. And that something should be instructive as to the nature and history of the event celebrated, and be worthily adorned with such visible adjuncts as should best convey this to the mind and eye. All classes of people come to Hyde Park and Kensington Gardens for healthful recreation, and therefore in a more fitting state of mind for doing justice to a fine monumental work and the subject it may illustrate, than if it were placed amid the busy hum of business in a crowded thoroughfare where people are rushing by to keep appointments and have no time for other thoughts than these of business.

Thus the occasion and the site, and the fostering the appreciation of art in this country, all point to a fitting memorial in High Park to the Great Exhibition of '51. It was for this that the supporters of the project subscribed, and this they think probably, at least I do, they should live to see carried out. If there has been or now exists any real idea to divert the funds subscribed for this purpose to another object, I should, for one, like to have my mite returned. There are plenty of objects to which one might like to apply it, as the patriotic funds for the poor widows and orphans of our brave

soldiers, or to celebrate virtue and energy, and do good at the same time, by applying it to the Nightingale Fund, without putting it in one's own pocket again; but I confess I should like to have a voice in the matter.

Now, it might be said I might have written all this to Alderman Challis, who so worthily put himself forward in the project in the first instance, and net to the *Art-Journal*. But, in the first place, I presume that I do nothing in thus mentioning a public subject that that gentleman would feel a moment's displeasure at, and, secondly, as I should think other subscribers to the scheme may have similar views with myself, I take the advantage your kindness may afford of thus recurring to the subject through the pages of your widely circulating journal.

I am, Sir, &c.

A SUBSCRIBER TO THE GREAT EXHIBITION OF '51 IN HYDE PARK.

[We have thought it right to insert this letter, with a view to draw attention to the subject; we believe, however, a very large proportion of the subscriptions were "promises:" but certainly those that were paid ought to be returned.—Ed. A.-J.]

CORREGGIO'S "READING MAGDALEN."

SIR,—You would place me under considerable obligation by clearing up some doubts relative to the celebrated composition of Correggio, "The Reading Magdalene." We are aware that Augustus III., King of Poland, Elector of Saxony, became the possessor of an undoubted original picture by Correggio of this subject, at the cost of 6500*l.* Considering the size, this is, up to the present time, the largest sum that has been paid for any painting. After the king's death, this picture was removed to the Gallery at Dresden, from whence it was some time after stolen. It, however, was, we are informed, recovered, and replaced in the gallery, and the picture now at Dresden is said to be identical with the stolen one,—but this is all matter of doubt. And what shall be said relative to the same composition, attributed to Correggio, in Lord Ward's assemblage of pictures? We are told that he paid 1600*l.* for it—surely rather a singular price, for if it be an original by Correggio, it must evidently (bearing in mind the price paid by the King of Poland) be worth four times 1600*l.*; and if it be not an original, it is net value for a sum much above 1600 *pence*. Truly, the mysteries of picture-dealing and picture-dealers are inscrutable. Perhaps, Mr. Editor, you can illuminate the subject in question—if not with the broad daylight effect of Rubens, at least with the partial gloam of Rembrandt.

ARTHUR VINCENT TURNER.
50, UPPER BAGGOT STREET, DUBLIN,
Dec., 1855.

[Perhaps some of our readers can give our correspondent the information he desires, for we confess ourselves unable to assist him.—Ed. A.-J.]

ADOLPHE TIDEMAND.

SIR,—Your readers may, perhaps, be interested to hear something of the most famous painter in Norway, and I therefore place at your service a few lines concerning him. The first pictures that met one's eye on entering the Exhibition here were those of Tidemand. I had seen something of his in New Bond Street once, a funeral on a Norwegian lake (now in the possession of Lord Lansdowne), and was prepared for great artistic power; but here his sincere and serious religious feeling made one forget Art altogether—that kind of feeling that affects one so in "The Cottar's Saturday Night" of Burns. Tidemand's most touching picture here was a funeral gathering, not on a lake this time, but in a lowly cottage. The resigned and utterly mournful face of the young widow, leaning on the shoulder of her mother—the unconscious poise of her sleeping, fatherless child—the solemn faces of the mourners round the table whereon the coffin stands, with the candles burning on it, and the words of prayer from the lips of the old man floating around it, in the dim light of the darkened cottage—the floor strewn with scattered leaves of fir—give to this picture that rarest quality of true, deep, unaffected poetry, of which I know no parallel example in English Art but "The Shepherd's Chief Mourner" of Landseer. It is well for Tidemand that he can see what lies nearest to him, for with these rusticities he has reached the hearts of princes, and now returns northwards with a Medal of the First Class and the Legion of Honour. I have spent a day with him here; he had never seen any English pictures before, except one or two of Wilkie's, and I felt proud to conduct him through our collection. It would be unfair to repeat his criticisms, but they were thoroughly honest, and

quite unaffected by mere reputation, for he scarcely knew the names of our most famous painters. He enjoyed Mulready, Webster, and Leslie most; but "The Order of Release" was more in accordance with the depth and sincerity of his own genius, and we stood a long time before it. He thought Lewis wonderful in his details of still life, and successful in expression, but the fierce, brilliant, white light of the "Harem" affords no opportunity for such powerful *chiar-oscuro* as his own, and I scarcely think he agreed in my excessive admiration of this drawing. The engravings from Landseer had led him to expect so much, that the pictures disappointed him—a common case. The lonely deer by the lake, and Maclise's large baronial interior, I was a little ashamed of; both these pictures will always look best in black and white. Tidemand was greatly interested in our engravings, and in the history of Art in England. I feel quite certain that if his own works were well engraved, they would be extensively purchased by us. I think his works, if studied by our younger painters, would have a very beneficial influence on the feeling of English Art, they are so full of true pathos and tender regard for mankind. The best proof of their excellence is that I have never thought of their technical qualities till just now. I have no room left to discuss them, and it does not matter.

PHILIP GILBERT HAMERTON.

HOTEL DU LOUVRE, PARIS, Nov. 15.

ART IN CONTINENTAL STATES.

PARIS.—The distribution of prizes has, as might have been expected, caused much dissatisfaction; old tried and talented artists have been totally forgotten, while others of very inferior merit, but well protected, have received large honours. Ingres and his school are outrageous to see him placed on the same rank as De la Croix and Landseer; although many good judges think one little "Doggie" by the last, worth more than all the productions of Ingres. One of his pupils said to the writer, "They ought to have invented a special honour for this great master."—The artists in general are repose on their laurels, or busy getting home their works; and little is talked of except a project, said to be nearly decided, of abolishing entirely the annual exhibitions, and having a permanent one in the new buildings of the Louvre: the idea is good if carried out in a proper manner. This there would be a constant *salon*, continually renewed as the painters finished their paintings, and the hurry occasioned by being obliged to be ready by a fixed day would be obviated.—Great part of the scaffolding has been removed from the Louvre, and disclosed two pavilions of a most magnificent description; it will be a splendid pile of buildings.—A statue of Monseigneur Affre, Archbishop of Paris, has been erected at Rodez; it is by M. A. Barre.—The Exhibition at Vienna, in 1859, is not to be universal.—The season of sales is begun, and they are carried on with spirit: the collection of pictures and bronzes belonging to M. Bertrand, produced 65,000*fr.*—An interesting sale of objects of *vertu*, containing among them many curious and rich Oriental articles, collected by the General Ventura, has taken place; the objects in general sold high. The taste for articles of *vertu*, bronzes, and paintings seems to be on the increase; added to which, the facility of communication with the great collecting country, England, gives a zest to sales unknown only a few years back.

ULM.—At the recent congress of Art-dilettanti held here, many of the questions were highly interesting. Those relative to works executed in Swabia, before the time of Van Eyck, have remained unanswered. The 23rd question was more interesting to English artists and patrons of Art than any of the others. It was—"What were the last results of the inquiries relative to the family of Holbein and their works before the migration of the younger Holbein to England?" Herr Eigner has the merit of having discovered a number of works, which, according to the signature, have been executed by one Hans Holbein (or Holbain, according to the inscriptions), who could neither be the younger Holbein, nor his father, and who has therefore been designated "Grandfather Holbein." Eigner's view has been adopted, from the unmistakable difference between the works, which distinctly show three different manners. But Herr Herberger, the keeper of the archives, adduces evidence against the suppositions of Eigner, showing that in Augsburg, in 1460, there was one Michael Holbein, a fellmonger and householder. In the same house resided Thomas Burgkmaier, in 1493; and in 1494, Hans Holbein, the painter, who, after 1496, became the possessor of the house, in

which lived also his mother, the widow of Michael Holbein. From 1502 till 1504, his brother Sigismund's name appears, and his own is continued until 1517, when he became a citizen of Basle. Before the year 1495, the name of Holbein does not appear in the register of the guild of the painters of Augsburg; but in 1524 his death is mentioned, although absent. It would thus seem that a better foundation than that of Herr Eigner is necessary to maintain the grandfather of Holbein in the position of a painter, as attributed to him. It may therefore be supposed that the Hans Holbein who, in 1499, painted "The Coronation of the Virgin," and the "St. Dorothea," in Augsburg, is not the same as painted "The History of St. Paul" in 1502. In the painters' book no second Holbein is mentioned; nor is there a third, although such a one was very active as a citizen of Augsburg. In pursuing the inquiries relative to the early state of Art, it was elicited that glass-painting in Swabia was by no means in a satisfactory state, even though it was well advanced in other countries.

EHRENBREITSTEIN.—A colossal statue of the late King of Prussia is about to be placed on this celebrated Rhine fortress; the present king having given a commission to Johann Hartung, the sculptor, to execute it in bronze. One of the finest works of Herr Hartung is the group, in marble, emblematical of the "Rhine and Moselle," which stands in the gardens of the royal residence, at Coblenz.

ROME.—The *Athenæum* informs its readers that the Queen of Spain has presented two valuable pictures, by Murillo, to the Pope. The subject of the chief picture is "The Marriage of St. Catherine," which always hung in the queen's bedroom. The other picture represents the "Prodigal Son," the same subject as the picture once belonging to Marshal Soult, and now in the Sutherland Collection. The Pope has had the pictures handsomely framed, with inscriptions commemorative of the donor. They are placed in the Museum of the Vatican.

HANOVER.—On the north-west of the city of Hanover there is an extensive and beautiful park, surrounding the palace of Herrenhausen, and it was in a retired spot in this park that King Ernest Augustus in his lifetime caused to be erected for himself a mausoleum after the design of that at Charlottenburg, by Schinkel. Thirteen years ago, one of the noblest of Rauch's works was placed there—the statue of the late Queen Frederika. A cast of this work is to be seen in the atelier of the artist, showing it to be a worthy pendant to that of Queen Louise; and now the artist has completed the marble monument of the king, which is destined for the same place, and is about to be transported thither. The monument has already been briefly described in our columns, but it may not be superfluous to say a few words on the sentiment of the artist's production. In such works he does not treat a representation of death as eternal—there is an allusion to life; nor in the monuments of the living is there a description of activity without an allusion to repose. Such is the spirit of the present work, and it must be confessed that as an evidence of the maturity of artistic power and exalted feeling, it will take a high position among the modern productions of its class. The base of the monument is in the form of a simple sarcophagus, with but little architectural ornament. At the four corners are four angels; those at the head are praying, and the two at the feet are singing—charming figures, relieving the severity of mathematical proportion by an expression of everlasting life. The polished marble of the architectonic parts of the composition contrasts most favourably with the more animated character of the figures. On one side of the sarcophagus are the initials of the king, E. A. R., and on the other the white horse, the heraldic type of the house of Hanover.

VIENNA.—The designs for a new National Bank and Exchange, the competition in which is limited to artists of Vienna, have been exhibited. The building is to be erected in the Herrengasse, the proposed site communicating with two other streets, the Strauchgasse and the Freyung. The building will comprehend an exchange, a bank, a coffee-house, and other departments for the transaction of monetary business. The directors of the bank have done well to limit the competition to the artists of Vienna, of whom Van der Nüll and Sicardsberg, Ferstel, Hansen Forster, Romano, Bergmann, Kornhäusel, Winder, Baumgärtner, and Fellner have responded to the requisition. The designs exhibited speak most favourably for the talent of the architects of Vienna; especially those of the two professors, Van der Nüll and Sicardsberg, who have worked together, and that of Ferstel. These plans, one of which will surely be adopted, are masterpieces in their department of art.

CUPID AND PSYCHE.

FROM THE BAS-RELIEF BY J. GIBSON, R.A., IN THE COLLECTION OF THE QUEEN.

It is a question not hitherto determined whether *basso-relievo*, or sculpture of the round figure, is the more ancient art: in the earliest records of history we read of "graven images," by which is generally understood perfect representations of living things; but, on the other hand, as the sculpture called "*basso-relievo*" formed a component part of the architecture of the oldest nations whose history has come down to us, it seems more than probable that the origin of both is coeval. The art of ornamenting their buildings with bas-reliefs was most extensively practised by the Egyptians, who covered almost the entire front of their edifices with these architectural sculptures, in compartments rising tier above tier, mostly cut in low relief, and some of them also frequently in *intaglio*, that is, cut into the surface of the stone, instead of projecting from it; this sculptured work generally presented a combination of figures and of hieroglyphics.

The Greeks brought this Art to the highest state of perfection; they, it has been remarked, "as a general principle considered the ground of figures in relief to be the real wall, or whatever the solid plane might be, and not to represent air as if it was a picture. The art with them was thus rather the union of sculpture with architecture than a union of sculpture with the conditions of painting. Although we can never expect to see the works of those great artists surpassed, or even equalled by later sculptors, yet it cannot be denied that the moderns have, by the application of the rules of perspective, introduced a wider scope for the representation of the picturesque. It is not supposed by the best authorities that the elder Greeks were ignorant of the principles of perspective, either as applied to painting or sculpture, but rather that the absence of it in the latter art, in their *relievi* works for instance—we have no opportunity of knowing what their painters did—arose from the conviction that perspective would be misapplied to sculpture. The Roman sculptors, or rather the Greeks who practised the art in ancient Rome, very commonly applied perspective to the ornaments of civic architecture, as we find buildings and other objects introduced behind the figures, "thus approaching the spurious style of relief in which the effects of perspective are attempted to be expressed:" various specimens of such works may be seen in the British Museum.

We are chiefly indebted to Flaxman for the revival in this country of a purer taste in the application of *basso-relievo* to architecture: his designs are founded on the best models of the Greeks. Our most distinguished living sculptors rarely execute works of this kind, except for monumental purposes, mainly, we presume, because the demand for it is so limited either for public or private buildings: Mr. Gibson, however, in the group he executed for the Queen, has produced a work of singular grace and beauty.

The fable of Cupid and Psyche, related by Apuleius, has often afforded subjects for our artists and poets; of the latter, the poem by Mrs. Tighe, an Irish lady, who died in 1810, is by far the best that has been written: it is in six cantos, and is characterised by a richness and brilliancy of colouring rarely excelled. This poem is not so widely known as its merits deserve.

Frequently as Cupid and Psyche have separately been represented by sculptors, we do not recollect to have seen them grouped together; Mr. Gibson has, however, produced a composition which inclines us to believe Mrs. Tighe's poem must have fallen into his hand, so luxuriously has he rendered the subject. The arrangement of the two figures is most harmonious in the disposition of the lines; the figure of Psyche is exquisitely graceful in pose, and beautifully modelled; while the foreshortening of the lower limbs and the high relief of the entire group would favour the idea that the sculpture is executed in the round, rather than on a flat surface.

W. ROFFE. SCULPT

CUPID AND PSYCHE

FROM THE BAS-RELIEF, BY J. GIBSON, R.A. IN THE COLLECTION OF THE QUEEN

THE COUNTRY OF CUYP.

BY F. W. FAIRHOLT, F.S.A.

WITH ILLUSTRATIONS FROM ORIGINAL SKETCHES
BY THE AUTHOR.*

If the accepted characterisation of a nation's felicity, conveyed in the well-known aphorism, "Happy is the country whose history is a blank," may be equally applied to individuals, then may we safely conclude that the old Dutch painters were among the happiest of the sons of Adam. Their lives were generally so entirely void of what playwrights term "incident," that we know little more of them than is conveyed in the three facts—that they were born in Holland; painted in the land of their birth; and were buried very little distant from the spot on which they were born. Contented with the calm monotony of their native land, they studied its narrowed sphere with so intense an application, and delineated it with so much truthfulness, that they imparted a charm to incidents and scenes the most unpromising, and arrested the attention of connoisseurs absorbed in the grander flights of Italian Art, compelling, by the innate merits of their work, a place of honour to be assigned the Dutch School, as a creation, *sui generis*, among the honoured of "the world of Art."

It is with national painters as it is with national poets, they suffer by translation. It is not possible fully to appreciate Dutch Art without visiting the Low Countries. It is not possible fully to feel the beauties of a national poet, unless we put ourselves in the position of his countrymen, and learn to understand the similes he brings from familiar objects, and appreciate their force upon the native mind. The *Ranz des Vaches* may be played in our streets without any other notice than its quaint or pleasing melody elicits; but its tones had so many home-associations for the Swiss soldiers of the armies of Napoleon, that after hearing it they deserted in such numbers as to oblige their imperial master to prohibit it in his camp. The golden sunsets of Cuypp, and the rich green meadows of Paul Potter, can be fully appreciated by any admirer of nature; but the quaint peculiarities of Dutch Art—its low, swampy landscapes, sometimes varied by ridges of sand, always abounding in water and sky, with a low horizon, having at times an unnatural look; its cottage roofs scarcely peeping above the raised causeways so laboriously constructed for necessary transit; its stunted willows and avenues of limes; its luxuriant herbage; its thousands of windmills; its well-fed cattle, and equally well-fed peasantry, are all so many truths, the more forcibly brought to the mind in travelling over the land whose painters have fixed them on canvas for ever, and made them familiar to the whole world.

One instance of this is as good for the purposes of illustration as a hundred would be. In the skies of Wouwermans particularly, we constantly see the bright blue partially obscured by a group of clouds of a perfectly smoky tint—a deep rich brown, totally unlike cloud tints among ourselves, and bearing a disagreeable similarity to our native horror, a "London fog"—now, this is as true a transcript of a Dutch sky, as Ostade's boors are faithful portraits of his countrymen; and it is impossible to be some hours in Holland without seeing the perfect honesty of many other points in their delineations, which might be considered tasteless or unnatural by the critic who judges at his own home. It, therefore, follows that peculiarly national Art can never be fully appreciated out of its country, or by persons who are not familiar with its features; and it also argues the extraordinary abilities of the native artists of the Dutch school, who could, out of such unattractive and unpromising materials, create a position now universally accorded them, antagonistic as it is to the classic and spiritual schools, which alone were considered to be worthy of attention

in the days when it first came fresh upon the world. It was truth again a victor!

Leslie, in his sound and sensible "Handbook for young Painters," has excellently explained this. He says—"Italy is sometimes called 'the land of poetry'; but Nature impresses the varied sentiments of her varying moods as eloquently on flat meadows and straight canals, as on mountains, valleys, and winding streams; and visits the mill and the cottage with the same splendid phenomena of light and shadow as she does the palace. This was well understood by Cuypp and Ruysdael, and their most impressive pictures

are often made out of the fewest and the simplest materials. There is a small sunset by Cuypp in the Dulwich collection. It has not a tree, except in the extreme distance, nor scarcely a bush; but this has one of the finest skies ever painted, and this is enough, for its glow pervades the whole, giving the greatest value to the exquisitely-arranged colour of a near group of cattle, bathing the still water and distance in a flood of mellow light, and turning into golden ornaments a very few scattered weeds and brambles that rise here and there from the broadly-shadowed foreground into the sunshine."

THE GRAND CANAL, NEAR DORT.

Albert Cuypp was born at Dordrecht (or Dort, as it is usually abbreviated) in the year 1606. It was the year that also gave another of its greatest artists to Holland—the profound master of light and shade, the "gloomy Rembrandt." The father of Cuypp was a landscape painter, but Jacob Gerritz Cuypp never raised his works above a quiet delineation of nature, the simple repose which might satisfy his countrymen, but would never lay claim to attention out of Holland; it was reserved for his son to give poetry to this prose, and by patient stages to work upward to greatness, and slowly to fame;—so slowly, indeed,

that death arrested the painter's hand ere he knew the value the world would put upon his labours. In his own time his works can scarcely be said to have been appreciated, and we have no record of even fair prices being given for them; indeed, it is asserted by one of our best authorities,* that down to the year 1750 there is no example of any picture of Cuypp's selling for more than thirty florins, which is about five shillings less than three pounds in English money. How would the worthy painter be astonished if he now saw his works fetching from 500*l* to 1000*l*. each, and sometimes more!

VIEW OF DORT.

It is another proof that the intellectual work for posterity; it is the great gift of genius alone to arrest the oblivion which generally follows in the footsteps of time, and reversing the order of decay, rise triumphant over its common laws.

Cuypp was born in stirring times, when his countrymen were actively engaged in resisting the oppression of Spain. They had not been permitted to enjoy peacefully the unenviable swamps of Holland, or the simple faith of their fathers, without a struggle unequalled in the annals of history. The bloody Alva, that fierce and inhuman protector of the Roman Catholic

church, had murdered its men in cold blood, at Leyden and elsewhere, after guaranteed submission to his arms, and their surviving countrymen had seen that Spanish oaths were as fragile as reeds; so, after losing the best men of their race, and laying their country beneath water, enduring horrors and miseries which might have been thought impossible among civilised men, they established at Dort a synod which opposed further attempts successfully, and ultimately gave independence to the Dutch.

* This, and other papers to follow, on the subject of Holland and its artists, are the results of a tour through that remarkable country, recently undertaken by Mr. Fairholt, during which he made many notes and sketches for express publication in this Journal.

* Smith, "Catalogue Raisonné."

Dort at this time became the important centre of political negotiation, and here the Stadtholder had his residence, and met those men from whose councils were framed the general independence of the country.* Here resided Burneveldt, one of the purest patriots in an impure age; and here was he arrested and carried to the Hague to die on a scaffold, sacrificed by the very people he had served so well, and who were blindly

A DUTCH FARM-GATE.

misled by their treacherous Stadtholder, Prince Maurice. At this time Cuyp was thirteen years of age, and must have been in the way of seeing and hearing much of an exciting kind; indeed, excitement of the strongest was at that time abundant in Holland. Home miseries were, however, succeeded by great successes abroad, and the trade and wealth of the country gradu-

HAY-STACKS.

ally grew in spite of savage internal dissensions, until the peace of Munster, in 1648, gave over-taxed Holland free leave to recover itself; but they had again the misfortune of a bad governor in William II., who embroiled the country in party war; his death in 1650 once more seemed to promise peace, but growing dissensions arose between England and Holland, and Blake and

A STORK'S NEST.

Van Tromp fought for each country at sea. The death of Van Tromp in 1652, and the gloomy

* The island on which Dort is situated may be called Holland proper, inasmuch as historians inform us it was one of the first settlements made by its earliest ruler on this district, once submerged by the sea, and to which the name *Holt land*, or wooded land, was applied. It thus casually formed a bit of unclaimed land, which gave Count Thierry, who had seized it, a right of independent sovereignty in the eleventh century, which he vigorously upheld, and assisted surrounding districts in doing the same. The water about it is still called Hollands Diep.

prospects of their trade, induced the Dutch to again apply for peace to Cromwell, which was obtained from him at so inglorious a rate, that universal discontent and rebellion spread throughout the republic, and increased into a flume during the early part of the reign of our Charles II. The Dutch were aided by Louis XIV., only to meet with his strenuous opposition on the death of Philip IV. of Spain, at a time when the people might have fully expected repose, and a formidable aggression on the part of the French army forced them once more to internecine war; the sluices were again opened, the country sub-

merged to destroy the invaders, and extensive tracts of land, which had occasioned years of persevering labour to protect against the sea, were reduced to barrenness and desolation. The murder of the De Witts in 1672 gave the whole power into the hands of the young Prince of Orange (afterwards our King William III.), who, by his admirable judgment, unflinching courage, and pure patriotism, raised his devoted country from the dust.*

Cuyp lived quietly through all this. The year of his death has not been recorded, but it was certainly after 1672, as his name appears in a

A DUTCH ROAD SCENE.

list of the burghers of Dort made during that year; and one writer, Immerzeel, of Amsterdam, states that he was living in 1680. Man and his wars of policy and religion appear not to have affected his calm course. His Holland was not the Holland of feud and dissension, but the calm home of the peasant living happily among flocks and herds in genial sunshine.

"His soul was like a star, and dwelt apart."

His world was nature, without the baser elements introduced therein by man; repose is his treasure; and his own quiet temperament is

reflected in his portraits, glows upon his canvas with a warmer radiance, and elevates the scenes he depicts with a poetry that scarcely belongs to the country itself. It may be asked, where, amid all this flatness and apparent monotony of scene, did Ruysdael study his romantic waterfalls, or Cuyp his hilly landscapes? The former must have dealt at times in the imaginative, but Cuyp might readily have strolled from his native Dort into the province of Guelderlandt, and been among scenes as far removed from general flatness as he ever depicted. With his dreamy love of nature, he must have gladly escaped the poli-

THE VILLAGE OF ROOSENDAAL.

tical and religious dissensions which agitated that city in his time, returning to it only as to a workshop wherein he might elaborate his sketches made in the peaceful fields, and dispose of them at a moderate rate among his less happy fellow-townsmen. His patrons are not generally known, with the exception of Prince Maurice of Nassau, who was attached to his pictures. It is quite possible that the painter's life was inexpensive and unambitious; his pictures would appeal directly to his fellow-citizens and their neighbours; and his moderate wants and wishes be amply satisfied by the small amount of

patronage they could offer, yet enough for his small wants and pleasant dreamings as a free man in his native fields.

The visitor to Dort will now see a very different city to that Cuyp inhabited; it has under-

* It is recorded of him, that when the proposal was made to him of constructing Holland into a kingdom, of which he was to be sovereign, provided he gave up to England and France what they required, and his consent urged because nothing could save Holland from ruin, he heroically refused, declaring "There is one means which will save me from the sight of my country's ruin—I will die in the last ditch."

gone changes, but many of the old buildings remain. As he approaches it by the steamboat from the Moerdyke, he will be struck by the peculiar aspect of the grand canal. It is walled by dykes, constructed most laboriously of earth or clay, and interwoven with a wicker-work of willow-boughs, which has to be continually renewed as it rots away. This accounts for the great cultivation of willows in Holland. The long lines of trees which edge the road on the

A WOODEN SHOE.

summit of the dykes have also their uses, irrespective of the pleasant shade their bowing foliage affords, for their roots assist in holding the earth together. So careful of these dykes are the inhabitants, that in some places they will not allow a plant to be plucked by the roots from their sides, for there is record of a great inundation, accompanied with much damage, having ensued by such an act, which gave water-way to a banked canal, the small leakage thus occasioned having rapidly increased, and ended

A FARMER'S WIFE.

in a torrent which was fatal to the level land near it. The abundance of windmills that surround Dort plays an important part in ridding the land of superfluous water, which is raised from the low country by their means to the higher embanked canals, and thence carried out to sea when the tide will allow the opening of the great flood-gates. The amazing number of windmills in Holland may be accounted for by the fact that they are destined to do at least three times the work they do in other lands.

A HORSE-SHOE.

They not only grind grain of all kinds, as with us, but they are extensively employed in sawing wood, and still more extensively in drainage, the most important of all employments in Holland. Consequently, wherever there chances to be a rising ground, there a windmill is stationed, and their numbers are sufficient to have quenched the ardour of the knight of La Mancha himself, who must have considered Holland entirely peopled with giants, with whom his single arm could only hopelessly contend.

The traveller who, like Oliver Goldsmith's, would wish to see

"Embosom'd in the deep, where Holland lies,"

would find his quickest course by rail from Antwerp. As soon as he leaves that quaint historic city, he finds the flat land assume a different aspect to the flat lands of Belgium; it is damper and more arid, patches of sand and rushes occasionally appear, and the inroads of the sea in the old times are visible. By the time he reaches the frontier town of Roosendaal he will fairly feel that he is in another land. Here, while the most minute search is made by the government officials on the luggage of the

entire train, he may study the view before him, which we have faithfully recorded in our engraving, and which is as characteristic of the country generally as anything he will meet on his journey. The low sand-ridges in the foreground, with a few stunted bushes on them; the higher sand-hills crowned by a windmill; the housetops appearing from the lowland beyond, looking as Hood happily described them, "as if set like onions to shoot up next season;" the masts of the vessels mixed among all, indicating the presence of a canal in the marsh, too low to be detected, are all strikingly peculiar features of this unique country.

Holland being at a lower level than any land

DUTCH HEAD-DRESSES.

on the continent of Europe, has been reclaimed from the sea by an amount of labour, in the way of artificial ramparts against its continued encroachments, unparalleled in the world. Goldsmith has well described this:—

"Methinks her patient sons before me stand,
Where the broad ocean leans against the land,
And, sedulous to stop the coming tide,
Lift the tall rampire's artificial pride.
Onwards, methinks, and diligently slow,
The firm connected bulwark seems to grow;
Spreads its long arms amidst the wat'ry roar,
Scoops out an empire, and usurps the shore;
While the pent ocean rising o'er the pile,
Sees an amphibious world beneath him smile;
The slow canal, the yellow-blossom'd vale,
The willow-tufted bank, the gliding sail,
The crowded mart, the cultivated plain,
A new creation rescued from his reign."

The necessary expense of this continued strain on the energies and wealth of the inhabitants, who have constantly to guard against the dangers by which nature has surrounded them, renders Holland a very expensive country for residence. The taxation in every way is immense, and with a national debt exceeding that of England, the people pay local taxes to a large amount, while personal property, even furniture, pictures, and prints, are taxed by yearly rates, increased as every trifle a man acquires in his home is increased; hence we find a sordid love of gain among the middle classes degenerating into downright cheating among the lower. The stranger visiting Holland must expect to be "shorn as a lamb," echoing Goldsmith's not very

THE VILLAGE OF BROECK.

complimentary lines on the Dutch, following those in the poem we have just quoted.

On reaching the Moerdyke and embarking in a boat winding among the large islands known as Overflakke, Beyerland, &c., and which seem to have been formed originally by the spreading currents of the Maas (or Meuse) over the once sandy levels of the sea, the stranger will more fully understand the amphibious life of the Dutch—

"A land that lies at anchor, and is moored,
In which they do not live, but go aboard." *

* Butler's "Hudibras."

With that strange love, born of early associations, a Dutchman seems to dote on the fetid canals of his infancy; and wherever the water is most stagnant, and the stench most oppressive, there he builds his summer-house, and goes in an evening to smoke his pipe and enjoy himself. How happily has Washington Irving depicted this abiding trait in his "Knickerbocker." The Dutchmen of America, true to their home pleasures, repaired to the dykes "just at those hours when the falling tide had left the beach uncovered, that they might snuff up the fragrant effluvia of mud and mire, which, they observed, had a truly wholesome smell, and reminded

them of Holland ;" but all this must have been only an approximation to the real thing, inasmuch as the smell of a genuine Dutch canal, when its fetid waters are only slightly moved by the heavy, slow-going barges, is something which exceeds description. Yet in these localities do we continually find gaily-painted pleasure-houses, rejoicingly inscribed with words over their portals, such as "Wel te vreden" (well-contented), "Gernstelyk en wel te vreden" (tranquil and content), and others all equally indicative of the content and happiness they produce to their owners.*

Nothing can exceed the vivid colours of the country houses we pass. The brightest of greens, the gayest of reds, the richest of blues cover their surfaces. They are generally separated from the road by the ditches which form a sort of net-work over the landscape, and the proper way of reaching them is indicated by a wooden door, regularly built up and standing alone—made, in fact, for making's sake—on the edge of the ditch. These advanced gateways are frequently seen in the pictures of Rembrandt, Teniers, and Ostade†. You cross the wooden bridge and enter the farm. The pasturage, upon which so much depends, is stacked close by the house, and is generally built up round a strong pole, to prevent its dispersion in a stormy wind, which sometimes unmercifully sweeps over the flat lands.‡ As they are finished they are surrounded by other poles, supporting a moveable roof, which is drawn downward as the stack is consumed, and so it is sheltered while any remains. The farm-house will strike a stranger most forcibly by the solid comforts it exhibits, the rich massive furniture it contains, the looking-glasses in ponderous carved frames, and the heaps of rich old Japanese and other china which abound everywhere; an evidence of the former trade of the country, once so exclusively and prosperously carried on. The kitchens, with their brightly-scoured kettles, bring to mind the kitchens of Gerard Dow, and the sleek kitchen-maids seem to have sat to Maas for his servant-wenches. But the wonders of the farm are the dairies: here they revel in cleanliness, sprinkling the stalls of the stables with snow-white sand, stroked into a variety of ornamental geometric figures by the broom, when the cows are away; and when these are present they are as carefully attended to as if they were children, their tails being hung in loose strings to the ceiling, lest they should dabble in the mire! When the cold season sets in, the animals are protected in the fields by a coarse sacking fastened over their backs, much like the coverings here adopted for favourite greyhounds, and the milk-maids are paddled lazily upon the stagnant canals that pass round each field in place of our hedges, until she lands on the square patch of swampy grass, achieves her labours, gets into her boat, and is pushed or paddled by a stout swain, pipe in mouth, to the next rectangular plot, until her pails are sufficiently filled, when she is pushed gently toward the farm. There is no use in hurrying a Dutchman; he does all things leisurely; anxiety on your part will only make him more perseveringly stolid, and irritation more obstinately immovable.

Town life differs from country life only in the extra gaiety produced by better dwellings, and a greater concourse of people: its formality is as great. The heavy carriages which traverse the streets of Amsterdam upon sledges instead of wheels, drawn by large black horses, are more indicative to a stranger of a funeral than a friendly call. The provision made upon the gabled houses for the board and lodging of the favourite storks also indicate the quiet character of the youthful Hollander;§—there are no *gamins*

here, such as infest the streets of Paris: those animals could not live many days in this ungenial clime. We can fancy the misery of one of them, seized by proper officials, and put into the heavy charity dress, to learn what was proper of a Dutch pedagogue. The lugubrious little old figures that pass for children in pictures of the old native school, seem to have never differed from their parents but in age or size. Formality runs through everything in this land; the night watchman still

"Breaks your rest to tell you what's o'clock;"

but he does more than this; he announces his approach by a huge clapper of wood, which he rattles loudly, probably to warn thieves of his approach, that they may leisurely pack up and go away, and then the guardian, like Dogberry, may "presently call the rest of the watch together, and thank God they are rid of a knave!"

To see the perfection of Dutch cleanliness or village-life run mad, the stranger should visit the renowned Broeck, in Waterland, as the district is properly termed in which it is situated, on the shores of the Zuyder Zee. From Amsterdam the grand ship canal, which extends for nearly fifty miles to the Texel, will be seen *en route*, and a four-mile drive deposits the stranger at the entrance of the village. There he must alight and walk over the village, for all carriages and horses are forbidden to enter this paradise of cleanliness. It is recorded that the Emperor Alexander was obliged to take off his shoes before entering a house. A pile of wooden sabots at the doors testify that usual custom of its inhabitants.* The rage for "keeping all tidy" has even carried its inhabitants so far as to tamper with the dearest of a Dutchman's treasures—his pipe; for it is stipulated that he wear over it a wire net-work, to prevent the ashes from falling on the footpaths; these are constructed of small coloured bricks, arranged in fancy patterns, and are sometimes sanded and swept in forms like those we have described in dairies. Nothing can exceed the brightness of the paint, the polished coloured tiles on the roofs, or the perfect freedom from dirt exhibited by the cottages, which look like wooden Noah's arks in a genteel toy-shop. The people who live in this happy valley are mostly well off in the world, and have made fortunes in trade, retiring here to enjoy Dutch felicity. The pavilion and garden of one rich old clergyman, Mynheer Bakker, has long been a theme of admiration. The good man revelled in a caricature of a garden in which he sunk much money; and at his death left a will by which it should be kept up. This is no inexpensive thing in Broeck, for, owing to the boggy nature of the soil, it continually requires attention and renovation.† In this garden are crowded summer houses and temples of every fanciful style yet "unclassified." Plump Dutch divinities stare at wooden clergymen, who pore over wooden books in sequestered corners; while wooden sportsmen aim at wooden ducks rotting on the stagnant water. The climax of absurdity is reached at a small cottage constructed in the garden, to show, as our guide informed us, how the country folks "make the money." You enter, and your guide disappears as rapidly as a Dutchman can, and leaves you to contemplate a well-furnished room, with abundance of crockery, an immense clock, and a well-stored tea-table, at which sit two wooden puppets, as large as life; the old man smoking his pipe, and preparing the flax, which the old woman spins, after the field labours are over. All the movements of these figures are made by clockwork, worked by the invisible gardener, and concealed under the floor. In former times the good lady hummed a song; but her machinery being now out of order, the stranger is only greeted on his en-

trance by some spasmodic yelps from a grim wooden dog, who always faithfully keeps watch and ward at her feet.

In Broeck no one enters a house by the front door, nor is any one seen at a front window. The front of a house is where the "best parlours" are, which are sacred to cleanliness and solitude. Irving's description of such an apartment is rigidly true: "the mistress and her confidential maid visited it once a week, for the purpose of giving it a thorough cleaning, and putting things to rights; always taking the precaution of leaving their shoes at the door, and entering devoutly on their stocking-feet. After scrubbing the floor, sprinkling it with fine white sand, which was curiously stroked into angles, and curves, and rhomboids; after washing the windows, rubbing and polishing the furniture, and putting a new bunch of evergreens in the fire-place, the window shutters were again closed to keep out the flies, and the room carefully locked up till the revolution of time brought round the weekly cleaning-day." The people of Broeck always enter their houses by back doors, like so many burglars; and to ensure the front door from unholy approach, the steps leading up to it are removed, never to be placed there but when three great occasions open the mystic gate, and these are births, marriages, and funerals; so that to enter a Dutchman's house by that way is indeed an "event."

The country girls generally wear the plain and ugly caps represented in our cuts; but the richer farmers' daughters, particularly in North Holland, are extremely fond of a display of the precious metals in their head-dress. Pins of gold, to which heavy pendants hang, and elaborated ear-rings frequently appear, and occasionally the hair is overlaid entirely by thin plates of gold covered with lace; the forehead banded with silver richly engraved; bunches of light gold flowers hang at each side of the face, and pins and rosettes are stuck above them. We have engraved a specimen of this oppressive finery, which is sometimes further enriched by a few diamonds on the forehead of the wealthy ladies of Broeck when they appear on a Sunday at church.

It would seem as if a Dutchman really loved the ponderous, for nowhere else may be seen the weighty wooden carriages in which they delight to drive along the country roads; they are solid constructions of timber, elaborately carved and painted, resting on the axles, and never having springs, which, indeed, are not so essentially necessary as with us, owing to the softness and flatness of the roads. The guide-posts are equally massive, and the outstretched hands with stumpy fingers which point the route to be taken, seem to be made for future generations. The wooden shoes of the peasantry make the foot the most conspicuous part of the body, and ensure slowness; while in some places the horses are provided with a broad patten strapped across the foot, and making their movements as measured and sedate as their masters.* The tenderness with which they look after their beasts, and comb and plait their tails, shows no necessity for a "Society for the Prevention of Cruelty to Animals" in Holland. Their solicitude for their cows and pet storks we have already noted; and the number of their charitable institutions is so great, that poverty or want never meets the eye of a traveller. There is a well-fed comfort pervading all classes, and a scrupulous neatness and order over the whole country, the result of a constant cheerful industry, which scarcely asks for rest.

It is not the custom of the travelling English to visit Holland; it is a *terra incognita* to them, though other parts of Europe are filled by them to repletion. In this and other papers we hope to bring its features strongly before our readers, if they will, by aid of pen and pencil, travel in imagination with us over the land of Cuyper, Rembrandt, and Paul Potter.

* The boggy nature of the soil of Holland, and the mischief which might be done by the sinking of a horse's feet, have led to these inventions, the low countries of England can also produce examples of broad protections to prevent a horse from sinking or cutting up the swampy land, somewhat similar to those used in Holland; and which entirely surround the shoe.

* To the left of our view of Broeck there is a good example of one of these erections in a sort of Chinese taste.

† Our first engraving represents one near Leyden, which is completely identical with those depicted two centuries ago by the artists named.

‡ In the second of our little cuts we have shown this useful and simple mode of stacking, which is universal in Holland.

§ These nests are constructed on small beams of wood, placed by the inhabitants on their house-ridges, as it is considered *lucky* to induce storks to build. They come regularly to their old nests in their periodical visits, and they are never molested. To kill or injure one would be considered as a sacrilegious act.

* These sabots, once so popularly known by name in England, when it was the custom to talk of William III. as having saved the nation from "popery, slavery, and wooden shoes," are generally formed of willow and elm. They are very cheap, and threepence will purchase a pair of the commonest kind, such as we engrave; but others are ornamented with carved bows and buckles, painted black, and smart-looking; these are much dearer, and worn by the better class of farm-servants, who sometimes protect the foot by a soft inner shoe of list.

† The gardener informed us that the surface sunk at the rate of half a foot in a year.

THE EXPOSITION UNIVERSELLE OF 1855, AND ITS CLOSE.

As we have done, in the case more nearly touching us—the “*Beaux Arts*”—so do we further purpose, in reference to that weightier manifestation of manufacturing effort, to which it was seemingly attached, to give our readers a condensed table, by means of which they can, without the labour of research, learn the main statistical incidents connected with it—viz: the number of contributors and the number of their works—the number and quality of honours gained in the different classes, upon the award of prizes—and their respective amounts. It will thus be seen how each country has stood, and how it has come off. Our great object in this having been in reference to home, we have only deemed it requisite to embrace in this process nine of the more important states that have joined in the exhibition. From the position of these on the occasion, that of Great Britain will be sufficiently illustrated for

all useful objects. We have ourselves felt a deep interest in the competition and contrasts which here, as in 1851, were salutarily conspicuous. They have confirmed, with an impression too potent to be further trifled withal, the truth that Manufactures and Art must become more and more connected each succeeding day, and that heavy must be the responsibility of those who having the power, do not zealously exert it to render that union permanent and all-pervading throughout our whole operative organisation.

We profess a thorough trust in the capacity of our working-classes to become comparatively refined in matters of artistic taste, if they be indulged in that education which can be without difficulty brought within their reach, and if moreover every one in their familiarity with exhibited Art be heartily encouraged: we fear not future competition with our foreign intellectual antagonists, if we be supplied, as we can be, with equal arms for the encounter. We have no reason to be discouraged from the result of the late grand re-union—and few, we are inclined to believe, are aware of the fact, which will appear below, that upon the whole,

Great Britain has taken off the greater proportionate share of the honours dispensed—with the multitude of which we have deemed it quite unnecessary to encounter numeral arrangements already sufficiently complicated. We must here premise that the latest French general catalogue is so defective in its details that they wholly forbid exact precision in the amount of exhibitors. We have in that matter sedulously endeavoured to arrive at a *cy pres*, which may enable our readers to form general results and conclusions upon which they may rely. In the table here subjoined, our readers can refer at once to any class of the 27 included in the organisation of the Exhibition, and find the number of exhibitors in it, for any of the nine States included, and what honours they gained in any of the medal dispensations. They will also find comparative tables.

We repeat, the results to England are encouraging rather than discouraging; and that, on the whole, our country is justified in reviewing the awards with a fair degree of natural pride: had our leading manufacturers done more, we should certainly have gained more.

From the above it will appear that the proximate proportion of the *Grand Medals of Honour* attained, in reference to the number of exhibitors, stands thus:—

America, $\frac{1}{70}$; Great Britain, $\frac{1}{91}$; Belgium, $\frac{1}{108}$; France, $\frac{1}{135}$; Prussia, $\frac{1}{220}$; Austria, $\frac{1}{272}$; Sweden and Norway, $\frac{1}{300}$. The Second Gold or Medal of Honour: Switzerland, $\frac{1}{5}$; America, $\frac{1}{3}$; Great Britain, $\frac{1}{49}$; Prussia, $\frac{1}{63}$; France, $\frac{1}{71}$; Austria, $\frac{1}{101}$; Belgium, $\frac{1}{103}$; Spain, $\frac{1}{210}$; Sweden and Norway, $\frac{1}{261}$.

It will be found that in the distribution of the silver and bronze medals, Great Britain held a similar former position, and upon the whole may be considered to have had accorded to her a sufficient testimonial of the comparative deserts of the contributors, by which she was content to support her manufacturing pretensions. We are aware that there have been many complaints respecting the decisions of the juries—we have no doubt that of many not a few had good foundation—but it is a useless and untoward task to overhaul errors of this kind. It is for future times, future organisations for similar vast rival displays, to guard, if it be possible, against the

causes through which they may be supposed to have occurred. It is for us, and all friends of our country's continued prosperity, to draw the moral from the great drama that has been enacted, and that is—that as all over the Continent, but more especially in France and Germany, Industrial labour appears to be in an unprecedented state of forward movement, developing itself with all appliances of Science and Art, England,—if she would continue to vindicate her past repute for pre-eminence, must bring amply to the aid of her zealous, manful, and intelligent operatives, those higher refining intellectual agencies to which we have alluded, and through which a sort of beauty is made to pervade and enliven with unimagined charms the rudest produce of their toils.

If we review the progress of British Art Industry during the past ten or fifteen years, we shall have much reason to congratulate our manufacturers and our artisans: a comparison of the present with the past is anything but discouraging. Many engines have been at work to produce advancement; if the Schools of Design have not achieved all of which they are

capable, they have certainly done much good. In spite of bad management, shortcomings, and unseemly squabbles, they have wrought a change in the manufacturing districts which is gradually converting the artisan into the artist, and which will in course of time enable our Art-workmen to compete with the Art-workmen of France—the true source of the superiority of French productions.

Are we not justified also in claiming for THE ART-JOURNAL a share in this *onward movement*? France has vainly attempted to produce a similar work. It is notorious that there is not in that country "a public" to sustain it. We have continual evidence that the manufacturer on the one hand, and the artisan on the other, appreciate our labours, because they learn from them: and perhaps there is not a single Art-manufactory in the kingdom in which the Journal is not the daily adviser of those who labour in "the work-shop."

So much we are free to say, to give heart to those for whom we cater; and to derive stimulus and encouragement for ourselves.

OBITUARY.

THE REV. ROBERT MONTGOMERY.

We have obtained, during the year which has just closed, so many sad reminders that "friend after friend departs," that we have become painfully accustomed, as it were, to the death-bell. But none of these warnings came upon us more suddenly than the loss of the Rev. Robert Montgomery. We had known him from his youth up,—had at intervals enjoyed his brightness and kindness in society—and been still more frequently interested and improved by his pulpit vigour and eloquence. We knew that the desire of his heart was to do good, and that one institution (the Hospital for the Cure of Consumption, at Brompton) has had its funds increased more than a thousand pounds by the earnestness and frequency of his sermons only: and we mourned for his "departure" as a public bereavement, even on that ground alone: for this was but one of his many "outlets" of Christian charity and love.

We knew Mr. Robert Montgomery before the world accepted him as a poet, and previous to his being ordained. He had, in the fulness of boyish recklessness, written a satire, which, knowing he would be sorry for it hereafter, we,—somewhat older and more experienced,—entreated him not to publish; but he was, even then, so brave for what he believed TRUTH, that he would not be advised, and so launched his paper boat upon the "ocean of strife," where it certainly attracted more attention than could have been expected for the work of an unknown author. Yet it did him harm—as satires always do—and made him foes who reluctantly pardoned, if they ever did so.

Gifted by nature with great good temper and unflagging cheerfulness, he endured the rebuffs then heaped upon him without evincing bitterness or disappointment, and determined, nothing daunted, to "try again." In the meantime, his youth, good looks, frankness, natural gaiety, and a perfect guilelessness of heart and manner, were winning their way in society, and those who felt a real interest in the man, more perhaps than in the poet, feared he would be spoiled for anything great. It was almost impossible to believe that the brilliant flutterer had a fixed purpose—from which he never swerved. Scraps of his poetry, full of beauty and feeling, in a different tone and spirit to "The Age Reviewed," enriched the pages of "The Literary Gazette," then edited by Mr. Jerdan, who was more likely to spoil an aspirant for literary distinction by over-praise, than to crush him by disdain or neglect. He "took up" Robert Montgomery with the same enthusiasm with which he had taken up "L. E. L.;" and the result was, that even before the publication of "The Omnipresence of the Deity," the literary coteries of which "The Literary Gazette" was the oracle, caught the new lion; and we have seen his progress watched through crowded salons, by young ladies with albums and old ladies without, but all anxious to obtain a bow or a smile from the young poet. There are no young poets now-a-days to "catch," but if there were, we doubt their being so petted and followed and flattered, as the friend who has just passed from this throbbing world. Unlike the generality of literary men, he had large talent for society; his "small change" was ever ready, and his ringing laugh and pleasant voice, told how much he appreciated the wit or cheerfulness of others. His conversation was rather flowing than sparkling, and he was never either "sharp" or dictatorial; never ready to "give it" even to his foes, though ready to "take it" without ill-temper. Indeed his fondness for society, and of late years his duties, occupied so much of his time, that it is a matter of astonishment how he found leisure to issue poem after poem. Had he been entirely devoted to literature, many of his productions would have been more worthy of his reputation, and more fitted to take their stand by "Luther,"—which we consider his finest work. It is well to look back and note how the young man, in the full blaze of his London popularity, devoted the means he gained by his poetry to graduate at Oxford

and enter the Church. He soon became noted as an eloquent preacher, and had his lot been cast in England instead of Scotland (where for some years he filled one of the principal Episcopalian churches in Glasgow), he would not have died minister of Percy Chapel. Some of the best years of his industrious life were embittered by bickerings and disputes at this great City of the North. Perhaps the most charitable judgment to write is, that the people did not understand him, and he did not understand them. On his return to London, after an absence of some years, he created a congregation of admirers and friends, and was himself the friend of all who sought advice or needed assistance; shrinking alike from the very "high" as well as the very "low" church, he continued faithful in what he believed the Christian path he had chosen; but it is possible that his belonging to no "party" retarded his Church preferment. He has frequently been accused of an over-love of popularity, and he was too truthful and sincere to conceal the pleasure that all derive from praise—indeed, wearing "his heart upon his sleeve"—there were abundant "daws" to peck thereat, and no man could have had so large a share of fame without having to contend with herds of disappointed detractors; an edition or two of a bad work may be "got through" by the instrumentality of reviews, or the labours of a publisher, and readers who do not care to think or feel, are often rejoiced at being spared both thought and feeling by the instrumentality of "the Press,"—adopting an opinion in lieu of the endeavour to create one: but the prestige in favour of an author's ability will not carry a publication through a score of editions, unless there be vital talent and vigorous power to bear it onward. It is far easier to catch than to keep a reputation.

"The Omnipresence of the Deity" has reached the eight-and-twentieth edition, and the mighty thunder of Printing-house Square long ago declared that, "a purer body of ethics had never been read, and that he who could peruse it without emotion, clothed as it is in the graceful garb of poetry, must have a very cold and insensible heart."

The Rev. Robert Montgomery was born in Bath, in July, 1807, and his boyish days were passed at Dr. Arnot's school, near his birth-place, and in 1843 he made a most happy marriage with Rachel, the youngest daughter of A. McKenzie, Esq., of Bursledon, Hampshire; the only surviving issue of this union is a little daughter of four years old. He died at Brighton, at the end of November, 1855.

Mr. Montgomery never corrected the notes of a sermon, without talking over in the domestic circle, where he was so tenderly beloved, the plan and subject of the next. With even more than usual care he prepared a sermon, which he preached on the 18th of November, in Percy Chapel, on *Jacob's Death Bed*, and his wife observed, that now she hoped he would take some rest, as he had not busied himself with preparations for the following Sunday. Many of his people say that that sermon was the most powerful and eloquent he had ever preached; it was like Mozart's requiem—his own dirge! His physician had often told him that he was wearing out his strength and brain, but he would laugh and reply that he would "die in harness." The poor, in every sense of the word, were very near his heart; by his preaching and collecting for them, he was enabled (we speak, having authority from one who knew him well) to distribute a *thousand a year* in charity, and this, when the net income of Percy Chapel hardly yielded him five hundred a year. But after that memorable sermon, his wife and physician insisted that he must rest, and the following Sunday he took the first holiday he had had for fifteen months; it is not to be wondered at if the discharge of the duties due to so large a congregation, added to his literary occupations, rendered him fearfully nervous; and it was hoped that perfect rest at Brighton would act as a tonic to his system; he never, during his brief but most trying illness, uttered an impatient word, and his mental wanderings were suggestive of the happiest and most consolatory images.

It was not until within a few hours of his death, that Mrs. Montgomery had an idea of his danger; he regretted that his strength had passed so rapidly away that he could only say little prayers for her and his people, and, after enquiring if some relations he hoped to see had arrived, he asked her whom he loved best in the world to say out the Lord's Prayer.

She did so, and his faltering voice followed hers until about the middle—it ceased! When she had finished, *his* could be heard no more on earth! The world knew him as a poet—his congregation as a faithful, eloquent, Gospel minister—the poor as an unfailing friend—but in his home, no more tender or unselfish husband, father, or relative, ever left a hearth desolate! Restless as was his nature, he could tame it down at any time to watch by the couch of sickness or relieve the pangs of sorrow. A few words in honour of his memory can be considered by no one as words out of place.

A. M. H.

MR. B. PISTRUCCI.

We have as yet delayed our notice of the death of this distinguished medallist, which took place at his residence, at Englefield Green, about three months since, in the expectation of being in a position to place before our readers a history of his life and his works. Hitherto we have not been able to collect the materials necessary for the purpose; we hope, however, to do this eventually; in the meantime we would remark that as chief medallist in the Royal Mint, Mr. Pistrucci executed, with the exception of the shillings and sixpences, all the coins of the reign of George III. since 1815, and the six principal coins of George IV.; the coronation medal of the latter monarch, and the grand medal to commemorate the battle of Waterloo, which has never yet made its appearance, although we believe it was completed long before the death of the artist. This medal is, we understand, one of the finest works of its class ever executed; but whether the public will ever have the opportunity of estimating its merits seems problematical; "for" in the words of a contemporary, "George III. died, still nothing certain was heard about it; George IV. died, and collectors were still impatient. William IV. died, and Mr. Hamilton assured us that it was in hand—would be a glorious work, and well worth waiting for. Then came the Mint Commission of 1848, and it was not forthcoming." The medallist himself is now gone, but yet we hear nothing of his final and chief work.

SAMUEL ROGERS, ESQ.

The death, on the 18th of December, of the venerable poet, Samuel Rogers, Esq., whose poems have so frequently been the themes of British painters, is an event not to be passed over in our columns; though we have but a few lines into which to crowd a notice of one who, for more than half a century, has filled no unimportant niche in the temple of literature, and in the great commercial circles of the metropolis. "It must have been," said a writer in the *Times*, the day after the death of Mr. Rogers, "by an extraordinary combination of position, of intellectual and social qualities, of prudence, and of wisdom, that the same man who was the friendly rival of Byron, Wordsworth, and Scott, talked finance with Huskisson and Peel upon equal terms, exchanged *bon mots* with Talleyrand, and was the friend of all the eminent men, and of many of the indigent and miserable who flourished and suffered during three parts of a century. Such a man was Samuel Rogers."

MR. JAMES CARTER.

We are desirous of supplying an omission in the paragraph which appeared in our last number, relative to the subscription that is being made for the widow and daughters of the late Mr. Carter. Mr. Ackerman, of the Strand, has kindly undertaken to receive any contributions that may be forwarded to him for the purpose set forth in our former notice.

TESTIMONIAL PLATE.

PRESENTED TO SAMUEL COURTAULD, ESQ.

PRODUCED BY MR. S. S. BENSON, OF CORNHILL.

ON the opposite page we introduce an engraving of a "piece of plate," which for want of a better name we must call a "centre-piece." It is a work of a more than usually high order; and as such justly claims the distinction we have given it: for, as the production of excellent Art-workmen, executed by an accomplished sculptor, and highly honourable also to the City gold and silversmith from whose establishment it issues, (and who is also the designer), it may be rightly considered and described as a very superior work of Art.

With its history we have little to do, further than to say that it is a testimonial presented to SAMUEL COURTAULD, Esq., whose memorable contest in the famous "Baintree Church Rate Case," effected changes in parish judicature which a large number of persons desired to record to the honour of the gentleman, who by large sacrifices, indomitable energy and perseverance, during a lengthened period of seven years, had fought a battle which terminated in a victory.

This testimonial is the result produced by the combined subscriptions of many sympathising admirers. The commission to execute a piece of plate was, after competition, given to Mr. S. S. Benson, of Cornhill—the style and subject being left entirely to his own taste and judgment. He very properly, and very wisely, sought the co-operation of an artist of high talent, and in Mr. Foley he found a worthy coadjutor. The production will certainly rank with the very best works of this class which have been executed in this country, and affords satisfactory evidence of our advance beyond the unmeaning and inartistic "things" which in time past wasted precious metal—rendering a testimonial valuable only according to its weight in silver. Some description of this work is necessary to guide those who examine it; and this description we copy from Mr. Benson's printed circular: the design being to exhibit "CIVIL AND RELIGIOUS LIBERTY TRIUMPHANT."

The upper figure (Liberty) holds in her hand the emblem of Victory; under her feet are chains, faggots, and scourges, the symbols of Civil and Religious Tyranny.

Liberty is supported on one side by Christianity, and on the other by Justice; Wisdom being the third figure in the tripod.

On the base, History records the triumphs of Liberty, Civilisation rejoices at the results; at the back is a Figure emblematic of Perseverance and Industry.

It has been thought desirable to make Moral Power the prevailing feature in this work; Justice is therefore divested of the Sword.

The height is about 30 inches; the breadth at the base, 23 inches. Weight of the whole 600 oz.

The engraving—which is highly satisfactory—has been executed by the eminent engravers, Messrs. J. & G. Nicolls.

We cannot doubt that the engraving of this very beautiful and highly meritorious work will be acceptable to the readers of the *Art Journal*. It does credit to all concerned: the design is of the best order; honourable to the fame of the accomplished sculptor: the Art-workmen have ably seconded the artist; and its issue cannot fail to enhance the reputation of the goldsmith, who in sending forth so excellent a work of Art, has advanced the character of "the City."

We attach more than ordinary importance to the production of this work: for it is a proof of the general progress of a purer order of Art; and a proof also that producers will not be, as they have so long been, content to send forth a valuable material degraded instead of elevated, by being passed through the hands of parties who can do nothing but follow in the footsteps of ignorant predecessors. Mr. Benson has taken especial care that all his associates should be worthy of trust: and we imagine the subscribers, whose combined contributions have been thus expended, must be more than satisfied with the result. Under such circumstances, the Manufacturer becomes an Artist.

MADAME LIND GOLDSCHMIDT
AT EXETER HALL.

PERHAPS our *Journal*—"The Art Journal"—ought, on the Continental plan, to embrace the Art Music, as well as the sister Arts; but to give the same attention, and render the same justice to music that we endeavour to do to painting, would require an augmented staff and enlarged space; so that only on rare occasions can we venture to touch upon what, we are happy to say, affords a continually increasing enjoyment to the English people. The re-appearance of a lady so distinguished and so respected as Madame Goldschmidt, however, calls for a brief record, even from us. And it certainly was with no slightly moved feelings of memory and expectation, that we once more encountered the crush of a "Jenny Lind night."

We rejoiced at the crowd inside and outside; we knew that Madame Goldschmidt deserved the welcome she was sure to receive; we never did separate, and we never wish to separate the "artiste" from the woman; we care not if we are called "enthusiasts" or "partisans," or any other ugly or foolish name; but we still consider Madame Goldschmidt the perfection of both woman and *artiste*; we cannot divide her talent from her charity; they are inseparably linked; we knew her noble, generous nature was unchanged; that she returned to England a happy wife and mother, with as warm an affection for the country as when she left it to test the reception she might meet in America: and we heard in the morning, from one well qualified to judge, that her voice was finer in power and quality than ever—this was to be expected. Madame Goldschmidt is in the prime of life; her voice has had long rest, with only occasional public exertion; and she is in the full enjoyment of health, and the blessings she has earned and deserved. From time to time we heard of her movements; and the great hearts of Europe beat stronger and quicker when they rehearsed her good deeds and triumphs. It was gratifying to observe how the audience poured in—and nothing but the admirable arrangements in the Hall could have preserved order; there were over a thousand "reserved seats," and had there been twice as many they would, even at this unpropitious season, have been filled. True, it was only here and there we recognised one of the *habitués* of the Opera—the unmistakable head, the genuine opera-glass, and irreproachable white gloves natural to "the stalls" in the old Haymarket, wondering how they got to the reserved seats at Exeter Hall. Looking round, we saw that the audience was a good, hearty, intelligent English audience, but it was *not* the audience which greeted the Prima Donna in "Alice," or hung upon her sweet sounds in the "Sonnambula;" however, if not as refined, the crowd had hearts and hands, and both hailed her appearance. As town fills, the regular opera-goers will be again recognised; now, the citizens—and that great undefined power, the "middle classes"—have the best of it.

We saw the multitudinous chorus and orchestra stumble up and down, as it might be, to their seats, and thought how much better it would be if they could have been classed or arranged, so as not to look so "spotty;" there a dense mass of black coats, here a patch of scarlet opera cloaks, and there again a flock of white dresses, looking so piteously cold and chill. We have a theory of our own that the chorus of an oratorio should dress like the choir of a cathedral, it would add greatly to the pictorial effect and expression of the scene. We had leisure too to think how exceedingly low the ceiling was for music, and how flat and ugly the room appeared—so hard, and blocked out without the least pretension to elegance or comfort: it is simply a square common hall fit for mob orators, it seems, but totally unsuited to its present high purpose. We were dreaming over what the walls could tell of the varied scenes which had passed within them, and thinking over what we ourselves had witnessed therein, when the organ issued its great command to the

gathering, and the stragglers swarmed into their places, and there was a low buzzing sound like the murmur of bees, and a rapid turning over of "scores," and the audience rose a little and fluttered a little, and then settled down. There was a pause, broken by "my seat, 879," "and mine, 908," followed immediately by "hush—h—h—," and then, slightly than ever, pale and white as a statue—not a bit of colour about her—her sunny hair parted and folded as in the "Figlia,"—large white roses at the back—no ornament except a diamond star upon her bosom—there came, half hesitating, half confiding, the unspoiled favourite of Europe and America. The orchestra, chorus, audience rose to greet her, every species of honourable "noise," from the hearty clap to the "bravo" and "hurrah!" gave her welcome—again—and again—until Benedict waved his wand, and the well-trained orchestra commenced "The Creation."

Perhaps no public singer ever found her way so thoroughly into the hearts of "the people" as Madame Goldschmidt; yet a clique here whose strength lies in a sneer, speak and write as if England was the only country where what they call "the Lind fever" prevailed: if there be such a distemper, it devastated Sweden and Germany, before its arrival in England; we only followed in their wake, and all our ovations are as the blossoms of a hedge primrose to the splendour of the *Victoria Regia*, in comparison with the homage rendered the *Cantatrice* in America. A fashion will last a season, but no longer; and many seasons, and, alas! years, have passed since Hans Andersen so eloquently and beautifully described the flutterings of the Swedish Nightingale in her own land. She looks still "the young girl robed in white," and she is still what she was then, as earnest in working out the character of whatever music she sings, as if she were a disciple, not a master, in her Art. Her musical conscientiousness is beyond all praise, she never thinks of self—never of where she can put in (a singer's temptation) "her best notes;" she bends to the composer's feeling as much as to the composer's style, and while she imitates his inspiration, becomes herself inspired.

When Madame Goldschmidt rose to give the first solo lines of that mighty chorus—"The heavens are telling," we knew her voice would tremble, yet they were delivered "as if an angel spoke;"—the sweetness and loveliness of "With verdure clad" thrilled through the room; but Madame Goldschmidt was not her perfect self until she sang "On mighty pens,"—that proved the truth of what we had heard, that her voice was not only greater but *fresher* than when she first came to England. After this varied burst of song, so faithful because so eloquent of sentiment and music, the audience paused as if unable to express their delight; but after a moment it burst forth into the most loud and animated applause, in which the chorus (forgetting its official dignity) tumultuously joined. Madame Goldschmidt acknowledged the enthusiasm of both with her old bows and smiles of pleasure. She carried the audience as triumphantly with her throughout the music of "Eve" as she had done while rendering "The archangel's melodies." Madame Goldschmidt's face in repose seems to us more thoughtful and steadfast, more marked than we remember it to have been; but it becomes perfectly radiant when she sings—which she does without an effort. In the more exalted passages her large blue eyes dilate into such darkness and power, that it is almost impossible to believe they are the calm soft orbs that a little before appeared communing with her own thoughts, heedless of the palpitating crowd.

The impression which her first appearance left was, that in sacred song she was firmer and finer than ever; and as it is to be hoped she will remain a few months with us, and visit the provinces, all who love music will have the privilege of hearing and seeing her. Continental "on dit" leads us to anticipate much pleasure from Mr. Goldschmidt's fine taste and excellence as a pianist. He is said to have powers of the highest and rarest order.

A. M. H.

TESTIMONIAL PLATE

TO SAMUEL COURTAULD, ESQ.

THE ARCHITECTURAL EXHIBITION.

OUR new year's number goes to press too early in the preceding month, to allow us to do more than mention the opening conversation of the Architectural Exhibition, which took place on the 18th ult., and was attended by a considerable number of ladies and gentlemen. The exhibition, which is now open at the Suffolk Street Galleries, consists of a large number of drawings of buildings recently erected, or in progress, together with designs, some views of old buildings, and a few photographs. There are about 600 works of these classes. Amongst the designs are several for decorative enrichments and furniture. There are also some specimens of executed decorations, and numerous models and specimens of materials, manufactured articles, and new inventions connected with architecture and decorative art. The merits of objects in these latter classes are to be reported upon by the council of the Royal Institute of British Architects, towards the close of the exhibition. Certain evenings are set apart for lectures, namely, "On Ancient Assyrian Architecture," by Mr. Fergusson; "On Early Christian Art, as illustrated in Mosaic Paintings," by Mr. Scharf; "On Utilitarianism in Architecture," by the Rev. J. L. Petit; "On the Ancient Architecture of Scotland," by Mr. Billings, and "On the Influence of Light and Shadow on Architectural Composition," by Mr. Thomas Allom.

The interest with which we have watched the progress of this exhibition is known to our readers; and though this year, there are a few leading architects whose recent works should have been represented, the collection approaches more nearly than that of last season to an adequate exemplification of the existing state of architectural taste, and there is every appearance that the assertion on which we ventured—that the rooms were far too small for such exemplification—was made with reason. The subjects to be presented in an exhibition of the kind, are very varied: for these, such classification as now may not be possible, would be desirable; and geometrical and detail drawings are so important to the architect visitor, and are objects so essential for the purpose of familiarising the public eye with their nature, and with the character and amount of labour and thought which go to the production of an architect's design, that we should wish to see the complete sets of many such works,—although without trenching upon space which it may be desirable to give to other subjects. Though, for opinions about the architectural talent of the country, it is still not sufficient to take the *data* solely from this exhibition, the collection gives many gratifying evidences of the progress which is being made. The provincial buildings are but sparingly illustrated: the exceptions—the Manchester warehouses, and recent designs for schools of Art—are, however, of some importance; and the contrast which is presented between some works of the former class, and what has been done in London, is unfavourable to the metropolis,—progressing as architecture here also may be. Again, it must be recollected, that the more important works of the day are being carried out by those who in many cases have little time for the necessary representation of them by perspective views. The aspect of the rising talent of the country is however, placed in a very favourable light. Were we to make any exception to such an assertion, we should allude to the somewhat dangerous fondness for crude colour, which in designs is by no means confined to interiors; but is sometimes distracting the attention of otherwise able architects from the higher expressions of beauty that are within the domain of form and proportion. The designs for decorations are, many of them, made without due consideration of principles—happily now more attended to than formerly; but they, nevertheless, display great talent, executive and otherwise; and some of the specimens exhibited are such as should bring honour and profit to those who have prepared them. Next month we may have space to look more particularly at the merits of some of the principal works.

MINOR TOPICS OF THE MONTH.

THE ROYAL ACADEMY.—We presume, although we have no direct knowledge of the fact, that the Members of the Royal Academy met, as usual, on the 9th of December, to elect their officers for the ensuing year. We think we have some right to complain of a want of courtesy on the part of the authorities, for not affording us the information which our subscribers naturally look for, but which we are not in a position to give them.* If the omission has been accidental, it ought to have been guarded against; if intentional, we take the liberty of saying it has not been merited; for though we have thought it our duty occasionally to express opinions adverse to the present constitution of the Academy, and to the pretensions of some admitted into membership, we have invariably acknowledged its services to Art, and employed whatever influence we may possess to uphold its privileges. It has generally been our practice, too, whenever the opportunity was afforded us of making the necessary examination, to comment on the works exhibited by the students for the annual prizes; which prizes are awarded on the same evening as that whereon the election of officers takes place; but this we are also unable to do, as we received no invitation to view them. But unwilling that the successful competitors should, through the carelessness or discourtesy of others lose the benefit of such publicity as our columns might afford them, we have obtained from an artist who was present on the occasion, a correct list of the awards, as follows:—the Gold Medal for the best historical picture, to Joseph Powell; the Gold Medal for the best historical sculpture, to John Adams; the Silver Medal for the best painting from the living draped model, John White Johns; Silver Medal, for the best drawing from the life, Philip R. Morris; Silver Medal for drawing from the life, James Waite; Silver Medal for the best drawing from the antique, Samuel J. Carter; Silver Medal for drawing from the antique, George A. Freezor; Silver Medal for the best model from the antique, Henry Bursill; Silver Medal for a model from the antique, Samuel F. Lynn; Silver Medal for a model from the antique, George Miller; Silver Medal for a perspective drawing in outline, Thomas Sich; Silver Medal for a specimen of sciography, Augustus H. Parker; Silver Medal for Medal die, cut in steel, Joseph T. Wyon. If we remember rightly, Mr. Powell had two medals awarded to him in 1853; he has now received the highest honour the Academy can bestow upon a student, and we heartily congratulate him upon his success. We have watched his progress for some time past, and although we have not seen the picture that has procured for him a golden reward, we have no doubt he has worthily won it. But with our congratulations we shall also offer a word of advice; he must remember he has only just entered upon the path which ultimately leads to fame; he has a difficult journey before him, and if he desires to reach the end of it honourably and to secure a lasting reputation, he must be up and doing laboriously, studiously, and perseveringly. There is no other method of accomplishing the task. We have known "gold medalists" who have thought that the receipt of that honour was sufficient to enrol their names among the worthies in Art, and relaxing in their efforts have never been heard of afterwards, except as a unit among the multitude; we trust such will not be Mr. Powell's fate.

THE NATIONAL GALLERY.—In contemplation of the removal of this edifice (according to a

recent recommendation of a committee of the House of Commons) a plan and notices have been deposited at the Private Bill Office, as a preliminary step towards applying to Parliament during the ensuing session for an act to enable the promoters to erect a large hotel on the plan of the *Hôtel du Louvre*, Rue de Rivoli, Paris, which is now one of the lions of that city. It is proposed to build the hotel on the site of the National Gallery, and on the ground in the rear now chiefly occupied by the barrack-yard and the workhouse of St. Martin's parish. Such is, at all events, the "Rumour;" but her thousand tongues may be all wrong. The Royal Academy is not likely to be dispossessed of that which is their right.

THE SOCIETY OF PAINTERS IN WATER COLOURS have elected John F. Lewis, Esq., President, in the room of the late Copley Fielding, Esq. The choice is a good one, and cannot fail to give general satisfaction. Mr. Lewis was for many years a resident in Egypt; the works of his more recent exhibition are picture scenes and incidents of the East, and they are of the very highest merit. He is the son of the venerable engraver, and the brother of the mezzotint engraver, Mr. Charles Lewis. The only other candidate was Mr. F. Tayler, who lost the election by five votes; eleven members voting for Mr. Lewis, and six for Mr. Tayler. A rumour prevails, that the latter lost his election through the fact of his being one of the Fine Art jurors at the Paris Exhibition, whose decisions have afforded so much dissatisfaction to the artists of our country.

SIR CHARLES EASTLAKE, P.R.A., during his recent visit to the South of Europe in connection with his office as Director of the National Gallery, has purchased for the nation a large picture by Paul Veronese, which was formerly in the church of St. Silvestre in Venice. The subject is the "Adoration of the Magi;" a reduced copy of a portion of it, attributed to Carlo Cagliari, is at Hampton Court. It is not yet hung in the gallery, and we shall therefore postpone any remarks about the acquisition till we are afforded the opportunity of seeing it.

MR. E. M. WARD, R.A., has been honoured with the commands of the Queen to paint a large picture representing the Installation of the Emperor of the French as a Knight of the Order of the Garter. The work will of course include portraits of the illustrious and distinguished personages who took part in the ceremony.

HONOURS TO ENGLISH ARTISTS.—Among the British artists to whom the Emperor of the French personally delivered the Cross of the Legion of Honour on the 15th of November was Mr. WILLIAM WYLD, whose works have obtained considerable celebrity, not alone in his own country but in France. Mr. Wyld however, has so long resided in Paris, that he is classed as a member of the French school, and he is, we believe, *décoré* accordingly. His name, therefore, does not appear in the English list: nevertheless, we share the distinction he has obtained, and acknowledge the very graceful compliment accorded to him by the Emperor.

ENGRAVINGS AFTER LANDSEER.—The unique collection of engravings from the works of Sir E. Landseer, recently exhibited in Pall Mall, is now, we understand, scattered, through the instrumentality of Messrs. Southgate & Barrett, the auctioneers. It is a great pity such a history of this painter's art should be dispersed. What an acquisition would the collection have been to some public gallery or museum.

BRITISH ART-ACADEMY IN ROME.—In the course of a lecture on Antiquarian Art, recently delivered at Birmingham by Earl Stanhope, his lordship took occasion to observe, how much benefit the Fine and Industrial Arts of our country might derive from the establishment of an Art-Academy in Rome, such as is possessed by our neighbour and ally, the French nation. The noble earl stated that he so much felt the improvement which to the manufacturing Arts especially—those, of course, connected with ornament—such an institution might confer, he should be greatly tempted in a period of peace, if his health and leisure would permit, to bring

* Since the above was written, we have seen in the advertising columns of a contemporary the following list of officers for the ensuing year:—President, Sir C. L. Eastlake; Council, E. M. Ward, S. Cousins, C. W. Cope, W. Dyce, P. MacDowell, F. R. Lee, J. R. Herbert, Esqs., and Sir R. Westmacott; Auditors, Sir R. Westmacott, Sir C. Barry, and W. Mulready, Esq. The new blood infused into the list of the Council will, we hope, impart fresh vigour into the "doings" of the Academy: there is one name especially among the "Council" which marks a new era in its constitution; it is that of Mr. Cousins, the engraver. It thus seems that at length engravers are presumed to be artists, and able to give advice on matters relating to a School of Art.

the question before the House of Peers. His lordship, comparing the state of our manufactures with those of France and Italy, reiterated the general opinion, that our inferiority is the result of the want of proper Art-education, a want that would be supplied by such an institution as he advocates.

THE PARIS EXHIBITION.—Our attention has been called to an error which appeared last month in "The Illustrated Catalogue of the Paris Exhibition;" the piece of lace engraved on one of the pages is manufactured by Mr. TREADWIN, of EXETER; it was stated to have been the work of Mr. Treadwill, of Honiton. This is an error we very much regret: but Mr. Treadwin has made his name so generally known, that no doubt it has but little prejudiced him: his productions are certainly the best of their class manufactured in England.

MR. EDWARD HALL, F.S.A., whose name frequently appears in our columns as a contributor of papers connected with his profession as an architect, has recently delivered two lectures at Westbourne College, Bayswater, the first on "Architecture, its Purpose and Origin," the second on the "Principles of Practical Art, as applied to House Decoration and Furniture." If the public were better educated in these matters than they are, and Mr. E. Hall is well qualified to be a teacher, we should see fewer absurdities both out of doors and in-doors, than now constantly meet our observation.

THE NIGHTINGALE FUND.—We ask the attention of our readers to the Report printed in our advertising columns, which the Committee have issued as the result of a Meeting that took place at Willis's Rooms at the end of last month. That meeting was in all respects remarkable; but chiefly as representing all classes and parties; the high purpose of the assembly, and of those who called it together and directed the proceedings, being to do honour to the admirable woman whose name has become a household word to indicate affection and respect. The newspapers have been so full of the subject, as to render it unnecessary for us to do more than express a hope that we may be the means of conveying to the Fund the contributions of many of our subscribers.

GLASS PILLS AND SASH BARS.—A combination of gilt or silvered metal, and glass for light columns or shafts, in buildings, has been at various times suggested as a means of decoration. At the Panopticon Institution, the architect, Mr. T. H. Lewis, introduced silvered plates of coloured glass, as a coating to some of the iron columns, and Professor Cockerell once suggested the use of glass cylinders with an iron column, gilt, as a core. Messrs. Lloyd and Summerfield, of Birmingham, have lately carried out a similar idea, which deserves the attention of architects. They manufacture bars of flint-glass, cut to various patterns and grooved, when necessary, for the insertion of the sheet of glass, or window-pane. The bars are considered to be applicable to skylights and glass-doors, besides show-cases and looking-glass frames. Their chief use, however, is put forth as regards shop-fronts. In that case several lengths are joined together by means of an iron rod, silvered, running through the centre, ornamental collars being fixed at the joints, and a capital and base added. Here the glass becomes the chief support; and the strength would be considerable, were it necessary to depend upon it. In shop-windows, it would of course be desirable to apply the pillars, if possible, without adding to the appearance of vacuity and weakness. There are, however, many purposes for which the bars may be brought into use in decoration; and they are manufactured in black and coloured as well as white glass. For instance, they are suitable for balusters, and, indeed, are made for this purpose in various forms. The convenience as to cleaning is of course a recommendation of any contrivance into which glass enters as a material.

MERCHANT TAILORS' SCHOOL.—In the course of the papers which appeared a short time ago in our Journal "On the Halls of the City of London," the writer ventured to urge upon the company the necessity of rendering their important public school more accordant with the age. He showed, that whilst the school was one

from which proceeded those who became men of influence as to educational advancement, no attention was paid to Art, and to subjects of vital importance to the national position. Having in the same paper and others, adverted to the several advantages derivable from greater development of the different branches of Art, the writer adverted to the value in education of knowledge of objects, considered as merely forms. It is therefore some satisfaction to us to find that the company has so far acted up to the spirit of our remarks as to arrange for tuition in drawing. The remuneration proposed for the master is not very large; but some men of ability are amongst the candidates. Drawing has become so common a branch of education in schools of far less pretensions, that Merchant Tailors' School could not safely stand longer in its old unimproved condition; and though the instalment for the advancement of Art is small, it is one which will be productive of great worth.

THE STATUE OF CHARLES I., which but a short time ago was cleansed from its surtout of smoke and blackness, is once more surrounded by a lofty boarding, preparatory, as we understand, to its being elevated on the site, to give it more importance than it has had since the erection of the Nelson Column and the National Gallery. The *tout ensemble*, as the passenger views it on approaching from the Admiralty, is now most unfortunate for the Statue, which is altogether lost by comparison with the objects in the background.

A NEW PAPER.—We write this notice on paper which we are given to understand is made entirely and exclusively of straw; and we are called upon to give our opinion of it. The process of converting straw into paper is, as our readers know, by no means new. Not long ago we examined a book, which professed to be printed on straw paper, which bore the date of 1800; but various circumstances have prevented its adoption into general, or even partial use; chiefly because of the difficulty of rendering it a good colour—clear and smooth: but also because it could not be produced at a cost less than paper of the ordinary character. These obstacles Messrs. Parkins & Gotto profess to have overcome. Evidence that they have succeeded in one respect is before us, and for the other we must take their word, or rather accept the witness supplied by the price at which it is sold—being about three shillings a ream for note paper, and in proportion for sizes larger. It is unquestionably of a good colour, a milky white: the pen runs over it rapidly, and it may be with entire safety written upon on both sides, being more than usually opaque. Because of its cheapness therefore, and its peculiar fitness for manuscript—indeed as *office paper*—this produce may be strongly recommended.

GLAZED BRICKS have long formed a *desideratum* in practical architecture. The facility of cleansing such surfaces has pointed them out as particularly suitable to the improved dwellings of the poor, and in 1851 some glazed bricks were exhibited, which would have been adapted to the end in view. The price was, however, an objection. Mr. T. Summerfield, of the firm of Lloyd & Summerfield, of Birmingham, has lately patented what he calls chromatic glass, or glass-faced grooved bricks. These are made in various forms, adapted to ordinary walling, plain and fluted columns and cornices, and as tiles for facing, and are prepared in several colours. By another patent, tiles are made to receive a pattern, with a view to their use for roofing, paving, and general surface decoration—as in the case of the ordinary encaustic tiles. Mr. Layard's discoveries, and the specimens in the British Museum, were hardly required to prove the durability of glazed patterns on clay, the mediæval encaustic pavements, after the test of wear, being found with the glazing scarcely injured.

NORWICH SHAWLS.—It was with no surprise we found that honours had been conferred in Paris upon the famous shawl manufactory of Messrs. CLABBURN & Co., of Norwich. Their renown has gone over Europe, and their fabric has very largely contributed to uphold the fame of the city that, for a century at least, has taken and kept the lead in a manufacture which is a

"staple" of Great Britain. It would have been unnecessary for us to allude to this matter but for the fact, that an injustice was committed in awarding to Messrs. CLABBURN "the large silver medal" instead of "the médaille d'or." The circumstances are briefly these. The jury especially appointed to decide on the merits of these fabrics, VOTED A GOLD MEDAL UNANIMOUSLY to Messrs. CLABBURN. The group of juries corroborated the decision of the first jury, also unanimously. The joint decision then came before the Royal Commission for confirmation, and they decided that Messrs. CLABBURN & Co. should only receive the large silver medal, because looking to the character of Norwich as a manufacturing city, its manufacturers—except Messrs. CLABBURN—had contributed nothing, directly, to the Exposition. That such is unquestionably the fact, is proved by the official letter addressed to Messrs. CLABBURN, and received by them; it is as follows:—MM. CLABBURN, Fils, et CRISP, ont obtenu le médaille de première classe pour la perfection et la beauté de leurs produits. Ils exposent des shâls en soie d'un joli goût et d'une belle fabrication. Leurs poplins sont d'une qualité supérieure, et l'on remarque dans l'Exposition de ces honorables productions des magnifiques étoffes quel on désigné sous le nom de Crêpe de Norwich, Paramatta, &c." It seems absurd as well as unjust to diminish the recompense to these gentlemen *because* they were the only manufacturers who upheld Norwich; *because* the city drew back from competition, and left its honours to the guardianship of a single firm—who, however, did guard them ably, and extended them widely. Surely, in such a case, justice would rather have augmented their recompense than have lessened it. But, in giving publicity to this fact, Messrs. CLABBURN's object is fully answered.

THE ROYAL SCOTTISH ACADEMY.—The Twenty-Eighth Annual Report of the Council of the Royal Scottish Academy of Painting, Sculpture, and Architecture, has just been issued; but the document has not as yet come into our hands. We understand, however, that the Council congratulate their constituents on the continued prosperous condition and still opening prospects of the Society. Next month we may have something more to say on this matter.

INDESTRUCTIBLE PRINTING ON METALLIC PLATES.—Dr. Lotzky, a Polish gentleman resident in London, has shown us a specimen of type-printing on metallic plates, concerning which he has written to say, that "Messrs. Adams & Gee, printers of London, have found that metallic plates of the thickness of ordinary sheet tin, may be printed upon with the usual printing type, if the plates be first coated with some peculiar composition. If sheets thus prepared and printed upon be afterwards subjected to a certain japanning process, an even lustrous surface is produced, on which the print may be read as if it were on common paper, and it cannot be erased but by a sharp steel instrument. Considering this invention, on the present occasion, only from its bearing on the culture and advancement of Art, it is evident, in the first instance, that all these lessons of lineal, architectural, or figure-drawing, which are largely used in schools, academies, and private instruction, can now be produced on the printed metallic sheets, effecting thereby a great saving of cost and change of those hitherto paper-printed patterns. In how far it is possible that copper-plate printing and lithography will be once practised on metallic plates—in how far it is probable that Arabesque ornaments on buildings, externally and internally, may be thus produced—an enamelled fresco painting of an imperishable nature,—time and our energy will decide. But recollecting the mosques of the Mohammedan religion, and the golden spans of the Alhambra, a profusion of ethic and moral precepts, and injunctions written thereon, strikes our eyes. I think that some of the Turkish inscriptions are written on China, or other fine sort of earthenware—a tedious and expensive process. I have some idea of printing on gold and silver plates, for the ornamentation of baptismal, confirmation, or matrimonial keepsakes, and testimonials of a more elevated character—a combination, perhaps, of enamel and filegree work, &c."

REVIEWS.

HANDBOOK OF THE ARTS OF THE MIDDLE AGES AND RENAISSANCE, AS APPLIED TO THE DECORATION OF FURNITURE, ARMS, JEWELS, &c. Translated from the French of M. JULES LABARTE. With Notes, &c. Copiously Illustrated. Published by J. MURRAY, London.

If, half-a-century ago, the same means of acquiring a knowledge of the Industrial Arts had been as much within the reach of our artisans and ornamentists as are now offered to them, what might not have been expected, ay, and accomplished, too, with the constantly increasing facilities that scientific discoveries, and largely accumulating capital, would supply to aid in their labours? But it is impossible to deny the fact that, up to a comparatively very recent date, ignorance has been the incubus sitting on our chariot-wheels, not, indeed, delaying its movements, but mystifying and misdirecting its course, and blinding the eyes of its occupants to a sense of the true and the beautiful, so that instead of moving onwards and upward, we have travelled round and round in almost an unvaried course, completing the journey of half a century not very far from the point from which we started.

Happily this state of things is in process of amendment, and in good earnest, too; evidence of which is supplied by the numerous publications which, during the last three or four years, have been issued to meet the increasing demand for books of an educational purpose: the work of M. Jules Labarte will be found to be one of the most instructive treatises on archaeological art that has hitherto appeared, and ought to be consulted and studied by all who are occupied in the ornamental arts. Originally written as an introduction to a descriptive catalogue of the Debruge-Dumoulin Collection, of which the author was co-inheritor; it affords a complete history of the origin and development of the Decorative arts during the period to which it has reference. The contents of the volume are arranged in the following order; Ornamental sculpture, painting and calligraphy, engraving, enamels,—a large and important section,—Damascent work, the lapidary's art, the goldsmith's art, pottery in its various branches, glass, the armourer's art, the locksmith's art, clockwork, ecclesiastical and domestic furniture, and Oriental art. Here is a range of subjects, ample enough to take in all on which the skill of the ornamentist may be employed; the only omission being that of textile fabrics,—we presume from the fact of these requiring for their production the aid of machinery, while others are the result of handwork alone. The observations of M. Labarte on the different arts show deep research into the works of the great artists of ancient times, and an intimate acquaintance with the principles on which they built up their artistic reputation: the translation is by a lady whose name does not appear, but she has performed her task well; and an abundance of charmingly executed woodcuts assist to make the volume a text-book and an exemplar of the highest value to those engaged in manufactures connected with Art.

THE EVE OF ST. AGNES. By JOHN KEATS. Illustrated by E. H. WEHNERT. Published by J. CUNDALL, by SAMPSON LOW & SON, London.

The critic who "does his spiriting gently," may lay himself open to the charge of partiality, or of possessing too much of the milk of human kindness, but he has the consolation of feeling that none except himself, perhaps, is injured by what he writes; his error is at least a godlike one when he leans to the side of mercy; and towards the young aspirant for fame in the field of Literature and Art, such feeling should always predominate, unless he be some bold and ignorant intruder to whom the lash would be of infinite advantage as a punishment for trespassing where he has no right to enter. This, however, was not the case with young Keats, on whose first appearance the "Quarterly" put forth so crushing a criticism, that its severity not only embittered his future brief existence, but laid the foundation of the disease which hurried him to an untimely grave. Byron, in his "Don Juan," alludes thus humorously to the death of the young poet:

"Poor fellow! his was an untoward fate;
"Tis strange the mind, that very fiery particle,
Should let itself be snuffed out by an article."

Even Jeffrey's kind, and generous, and appreciating review in the "Edinburgh," on Keats's second volume of poems, failed to atone for the injuries the poet had already received; the bow had been drawn, but not at a venture, and the shaft struck right home. Yet Keats was a true poet, his mind

was richly stored with forms and thoughts of beauty and grandeur drawn from Classic lore; he had a creative fancy united with deep feeling, and an enthusiastic love of nature. He lacked, however, the discipline which time and experience would have brought to soften the crudities of style, and to teach him to arrange his thoughts, and to use, without prodigality, the materials at his command. "His writings," said Jeffrey, "are flushed all over with the rich lights of fancy, and so coloured and bestrewn with the flowers of poetry, that, even while perplexed and bewildered in their labyrinths, it is impossible to resist the intoxication of their sweetness, or to shut our hearts to the enchantments they so lavishly present."

The character of Keats's poetry, like that of Shelley, and of others of a somewhat similar school, is not of a nature to be popular; his admirers will always be few but enthusiastic. The most considerable of his poems are "Endymion," and "Hyperion," both of them containing passages,—"and many of them, too,—which any poet of any age might not have disdained to acknowledge as his own. This "Eve of St. Agnes," written in Spenserian measure, is lighter and more graceful than those, sparkling with brilliant descriptions and flowing expressions. This edition, very prettily illustrated, and in its external dress of emerald and gold, must be one of the "gift-books" of the season. Mr. Wehnert's designs are of unequal merit, but there are none to which we would positively take exception; they are well engraved by Messrs. Harral, Bolton, and Cooper.

THE PROPORTIONS OF THE HUMAN FIGURE. With Six Illustrative Outlines. By JOSEPH BONOMI, Sculptor. Published by H. RENSHAW, London.

Whether the impeachment be right or wrong, the charge brought against our artists of all classes is, their incapability to draw the human figure correctly; and certainly it is a grievous fault where it exists. Drawing is the fundamental principle of all Art; composition, colour, expression, are comparatively valueless without truth of form. Nay, where those qualities are most conspicuous, they only heighten regret at the absence of the latter. Mr. Bonomi's pamphlet—for it is nothing more, yet quite sufficient for its purpose—will, if carefully studied, be of service to the young painter and sculptor, though he professes to give nothing more than what has heretofore appeared in print, but not in such a way as to come within the reach of all. He has taken the text of Vitruvius, as translated by the late Mr. Wilkins, R.A., Professor of Architecture at the Royal Academy, and amended from the Italian of Leonardo da Vinci. Mr. Bonomi is of opinion, that the celebrated Canon of Vitruvius, relative to the proportions of the human form, and which is referred to by Leonardo, is, in fact, the work of Polycleetus. Mr. Bonomi's notes to the treatise of Vitruvius and his diagrams, will be found sufficient aids to the study of the subject.

JUVENILE LITERATURE: THE MARTYR LAND. ANGELO. SIR THOMAS. THE TALKING BIRD. TALES OF MAGIC AND MEANING. Published by GRANT & GRIFFITHS, London.

We have named five of the publications of Messrs. Grant and Griffiths, as types of the class of books which "The Corner of St. Paul's Churchyard" has sent forth for the amusement and instruction of the young this winter. We once heard a publisher say to a lady who had acquired a good reputation as a writer for children, "that it was very easy to 'knock off' a child's book." This is a great mistake: writing for children requires more care and thought than writing for those who can care and think for themselves. Children are more reasoning and observant than they are believed to be. We have only to look back to our own early days to be convinced of this, and recall what we heard that it was not intended we should hear, and all that we remembered of what we never should have heard. It also requires considerable skill to infuse a lesson into a child's "story," without appearing to teach or preach. This danger has been successfully avoided in "THE MARTYR LAND," a well-drawn and simple history of the sufferings of the VAUDOIS during their bitter days, which were drawn to a happy conclusion by the father of the present King of Sardinia, CHARLES ALBERT. The thread upon which these historic scenes are hung is skillfully woven, and adds much to the interest of the charming little volume. We cannot agree with those who say such persecutions should be forgotten. History is the great teacher of the future, and as long as facts are recorded, as they are here, without undue bitterness towards the persecutors, they cannot fail both to warn and to instruct.

"ANGELO, OR THE PINE FOREST IN THE ALPS," is by GERALDINE JEWSELY, and prettily illustrated by JOHN ABSOLON. This will be a favourite story with all young readers; the characters are well drawn and life-like; there is enough of adventure to charm the boy, and sufficient of home-love to please the girl. We have read it ourselves with great enjoyment.

"SIR THOMAS, OR THE ADVENTURES OF A CORNISH BARONET," by Mrs. R. LEE. We almost believed that Mrs. Lee could have found nothing new to say of Africa, and yet "Sir Thomas" is as original in construction as it is interesting in detail. The sketch of the old Cornish gentleman is fresh and vigorous, and his adventures in the swartly land of his adoption, are full of strange wild life, fresh and health-giving. "ANGELO" will be most relished by children under twelve; but young ladies and gentlemen who have entered their "teens" will not think "Sir Thomas" "a child's book." Indeed old and young will find more than an hour's interest and amusement in its pages.

"THE TALKING BIRD" is a pretty story for young children, intended to prove the wisdom which conceals the future from our knowledge. MARY and ELIZABETH KIRBY are becoming such household names in juvenile literature, that we would entreat them to bring out the moral of their tales by human rather than by impossible means. An avowed fairy tale is pleasant, and not injurious; but fact and fiction are so mingled in "The Talking Bird," that it is not easy for a child to understand what is to be believed, what disbelieved. These ladies' style of writing is simple and engaging, but one of the first steps towards serving a child, is to engage its belief. All who read much to children have frequently heard the little earnest question, "Is that all true?" We had a hard task to separate the true from the untrue in this well-told tale; and the best criticism was that of the child to whom it was read—"But she should have been taught how wrong it is to want to know things that she ought not to know without a black dove, which I don't believe in."

"TALES OF MAGIC AND MEANING," are so called, we presume, for the sake of the alliteration; and here we have Mr. ALFRED CROWQUILL as an author as well as an artist. We have long rendered him all honour as an artist in his own peculiar style, but were not quite prepared to yield him the praise he certainly deserves as an author. We have rarely met with a volume of fairy tales more charmingly disguised, or in better keeping with their object. It is most difficult to invent a new fairy tale,—and translators have ransacked the northern and southern nations for every scrap of fairy lore that it was possible to turn into English. Mr. ALFRED CROWQUILL cannot claim strict originality for all the tales in his delightful little volume; but they are so gracefully arranged and so freshly dressed, that they are all "as good as new," while some we believe to be purely original. Then, they are really "Tales of Meaning." They have all objects—good objects—and their gentle teaching is as skilful as it is pure.* Now and then, in compliance with the bad taste of the times, there is a word, or perhaps a sentence, in accordance with the "fast" school, which will make boys laugh and girls wonder—but this does not often occur—we are almost hypercritical to note it; but we are very fastidious in our nursery, and have named the only faults we can discover. "The Little Silver Bell" might be made the groundwork of an "entertainment"—indeed, the tales are all dramatic, and Mr. Planche could weave any of them into a spectacle, that would take "the town" by storm.

SABBATH BELLS CHIMED BY THE POETS. Illustrated by BIRKET FOSTER. Published by BELL & DALDY, London.

A book that requires not the help of the reviewer to lift it into notice if once seen. It was a happy thought to bring together what a multitude of poets have sung in harmony with the sound of "the church-going bells," so as to make, as it were, a chorus of sweet and solemn music, floating along streamlet and valley, from "distant towers and antique spires," presented by the pencil of so charming a sketcher of rural scenery as Mr. Foster. It is a book for the six days of toil or the seventh day of rest, adding to the hallowed influences of the one, cheering and softening the labours of the others by the prospect of what is to succeed them. Among all the sights and sounds that are welcome to our

* In "Young King Flexible" we think a mistake has been made in working out the story by means which should never be introduced into nursery or school-room, because they must originate thoughts and questions that are better avoided; the object of the story is as good as that of any of the others, it is its detail that we object to.

eyes and ears, none are more pleasant to us than to see the humble inhabitants of some rural district wending their way through pasture, and cornfield, and hedgerows, to the house of prayer, when the Sabbath-bell summons them together—

"Six days may rank divide the poor,
O Dives, from thy banquet-hall—
The seventh the Father opens the door,
And holds his feast for all!"
BULWER LYTTON.

It will be a dark hour for England when, whatever the pretence may be, this seventh day is no longer a reprieve from mental and bodily toils, but pressed into the service of the others, as there is danger it may be when the Sunday is made, legally, a day of "innocent recreation." We have, however, one fault to find with the artistic portion of this otherwise elegantly "got-up" volume; it is a great pity the illustrations are coloured; the beauty of Mr. Foster's designs is by no means increased by the tintings, while the delicacy of the engraving, by Mr. Evans, is altogether lost; they would have been far more acceptable left plain. It was quite a "mistake" to send them forth in their present garb.

A MANUAL OF ELECTRICITY, INCLUDING GALVANISM, MAGNETISM, DIAMAGNETISM, ELECTRO-DYNAMICS, MAGNETO-ELECTRICITY, AND THE ELECTRIC TELEGRAPH. By HENRY N. NOAD, Ph.D., F.R.S. Published by G. KNIGHT & Co., London.

Some years since, Dr. Noad published his "Lectures on Electricity." These were very favourably received, and three editions have been exhausted. Dr. Noad has re-arranged—in a great measure re-written—his former work; and his last edition assumes a more complete form as a "Manual of Electricity." There is no department of physical science in which such advances have been made as this. Within a few years the lightning of a thunder-cloud has been shown to be of the same character as the electrical spark of a glass machine. Machine, or frictional electricity, has been proved to be identical with chemical or voltaic electricity. The conversion of these forms of force into magnetism, and the production from magnets again, of these two forms of electrical force, sufficiently determine the relation between them. The physical arrangement of most forms of matter has been shown to be due to some law of magnetic polarity; and, in the operations of vitality, it is evident that there is a development of electrical power. All these facts have been established by a series of inductive experiments of the most perfect character, such as scarcely any other division of experimental science can produce. Beyond this, electro-chemistry has been applied to metallurgical operations of the utmost importance. By the electrolytic process we obtain *fac-similes* of the most perfect examples of ancient Art; and by producing, at a comparatively small cost, copies of the highest efforts of the human mind, an improved taste is generated, which would otherwise have remained untought. We silver and gild the common metals by the electricity which we get by chemical change in the battery, or by merely mechanical power from the permanent magnet. Beyond all this, the electric telegraph now spans Europe with its wires; it unites our island with the Continent; it is stretching its fibres across the Mediterranean Sea; and, as we advance with our wires towards the East, India is rapidly sending electrical threads westwards, so that soon Europe, Africa, and Asia will be chained in this mysterious bond, and we feel safe in saying that eventually, and at no far distant period, the Old World will be united with the New—an electric girdle will indeed encircle the earth, compared to which Puck's girdle was the plaything of an idle boy. Electricity, then, is the science of the age; and such a manual as Dr. Noad has given was required to tell us of the truths of electrical science, and to instruct us in its laws. We have carefully examined this, the first part of the manual, and we are bound to declare that if the work is completed—which we do not doubt but it will be—as ably as this extensive portion of the subject is executed, there will be little left to desire.

POPULAR MUSIC OF THE OLDEN TIME. By W. CHAPPELL, F.S.A. Published by CRAMER, BEALE & CHAPPELL, London.

We have devoted very little attention in our journal to "things musical," but the interesting publication upon our table has a claim. Apart from "the language of sweet sounds," not only is it a collection of "Ancient Songs, Ballads, and Dance Tunes," illustrative of the national music (perhaps

it would have been better to call it the national melodies) of England, but Mr. Chappell has rendered the numbers valuable by introductions to the different periods, and notices of the airs of the sixteenth and seventeenth centuries. There is an interesting account of the minstrels, and notes upon various antiquarian matters that are, as it were, bound up with music, so that when our fair friends have tried over the "airs," they take possession of the information. Some fifteen years ago, Mr. William Chappell published a collection of "National Airs," now, we believe, out of print; but of all our writers, the antiquarian is the most persevering; and so Mr. Chappell went on collecting and collating until he was able to send forth this very able and interesting addition not only to our musical, but our antiquarian libraries. A great deal of the information now given, in this pleasing and popular form, was locked up in "Ritson's Dissertation," in "Percy's Reliques," in monastic records, in Dr. Burney's history—in scores of "ungetatable" quarters—from whence Mr. Chappell has drawn and arranged it; and it is no small advantage to find a publication for the music-stand as well as for the drawing-room table, combining learning and pleasure in so agreeable a manner. We thank Mr. Chappell as much for judgment as for industry and good taste; the musical world are indebted to him for the preservation of our few fine airs; and his addition to our literature is a matter of congratulation to our book-collectors.

THE KEEPSAKE.—1856. Edited by MISS POWER. The Engravings under the superintendence of Mr. F. HEATH.

Were it only for the sake of "lang syne," when the table groaned beneath a load of "splendid annuals," we should rejoice to welcome this "relic" of the past to our drawing-rooms. But, take it altogether, even without the "memory," it is a pretty and a pleasant volume, bright in scarlet and gold, and filled with enough of tale and song to charm the lovers of light literature in the twilight, or by the Christmas fireside. Portraits of the Duchess of Argyll and the Marquis of Lorn have called forth a highland song by Mr. Bennoch; and the pencils of Margaret Gillies, Desanges, E. H. Corbould and others, have been "worked up to" with feeling and spirit by those who have "written to the plates." Miss Power has done her spiriting gracefully; and her own story, "Percy Leigh's Wooing," reminds us of some of poor Lady Blessington's tales. There is a translation of "Auld Robin Gray" into French, by the Chevalier de Chatelein, which is really a literary curiosity, faithful as it certainly is. The actual construction of the language is incapable of conveying the sentiment of the charming original:

"Young Jamie loo'd me weel,
And asked me for his bride,"

is faithfully rendered into

"Jeune Jacques m'aimait, il me voulait pour femme."

But if we translate that back into English, how strangely it reads. There are several names in the table of contents that belonged to the palmy days of "the annuals": Barry Cornwall, whose only fault is, that he writes too little; Rev. Henry Thompson, M.A.; Mrs. Abdy, a faithful contributor to "the annuals," and we believe (alas for time!) the only survivor of "the Smiths," whose "Rejected Addresses" were anything but "rejected" by the public; Mrs. S. C. Hall, Mrs. Newton Crossland, always grave and graceful; Mr. Albert Smith, who occasionally descends from Mont Blanc to ascend Parnassus; Major Calder Campbell; Mrs. Warde, who has written so much and so well about "the Cape;" Mrs. Shipton, who, when "Anna Savage," was one of Lady Blessington's favourite contributors. There are others comparatively new to the craft; all have done their best for "The Keepsake;" and there is one delicious little poem towards the end by Mrs. W. P. O'Neil, which no mother could read without tears; it is called "A Child in Heaven," and is in itself worth the price of the volume, which is a pleasant first offering for the New Year.

THE POETICAL WORKS OF GEORGE HERBERT. Illustrated. Published by NISBET & Co., London.

With a distinct recollection of the multitude of elegant books that have been sent out for many years past, we cannot call to remembrance one that can lay claim to superiority over this as a specimen of illustrated typography: it may serve for a model of the printer's art in the nineteenth century, so delicate is the type, and so admirably are the sheets printed by Messrs. Clark, of Edinburgh. The paper

is like vellum in the smoothness of its surface; the woodcuts and designs are in the best style of Messrs. Birket Foster, J. Clayton, and Noel Humphreys; and engraved by Messrs. Evans, Dalziel, and Woods, with a degree of refinement that cannot be surpassed; and the binding by Messrs. Leighton, Son, & Hodge is rich but very chaste: altogether it is a volume of rare merit. The poems of the ancient Rector of Bemerton are worthy of the skill and taste that have been here exercised upon them; quaint as they all are, and full of fantastic imagery and strange conceits, as many of them are, with here and there expressions and similes he would never have used in such an age as ours, there are also in them many tender thoughts, and much deep religious feeling. Good old Izaak Walton was a great admirer of George Herbert, and has left a pleasant and graceful record of the divine in his "Country Parson." We hope, in a future number, to give some specimens of the illustrations which grace this edition of Herbert's Poems, and shall postpone till then a more lengthened criticism on the volume; but in the mean time would commend it as a new year's offering that must yield precedence to none of this season or any other.

WAITING FOR THE DEER TO RISE. Engraved by H. T. RYALL, from the Picture by Sir E. LANDSEER, R.A. Published by GAMBART & Co., London.

This print, intended to form a companion to one published some time since, "There is Life in the old Dog yet," was, we believe, originally engraved for Sir F. G. Moon, but, on the retirement of the latter from business, the plate was purchased by Mr. Gambart, who also holds Landseer's picture from which it was taken. If we have been rightly informed, the publisher intends to have the plate destroyed as soon as the number of impressions he proposes to issue have been struck off: if this be done in all good faith, it will be the first step, on the part of a publishing firm, as regards a new plate, in the move recently made by Mr. Boys, to limit the market, and so far to satisfy the collector that his purchase is not likely to become materially deteriorated in value. We are assured that the number of impressions taken is as follows:—100 artist's proofs; 100 proofs before letters; 100 lettered proofs; and 750 prints. We have mentioned these details, as the purpose of the publisher commences a new era in the history of the "trade." With respect to the print itself, though not so acceptable a subject as many of the works of Landseer, it is an admirable representation of Highland deer-stalkers enthusiastically occupied with their sport; the figures are skilfully grouped behind some rising ground, watching, with their dogs, the appearance of the antlered tribe in some portion of the landscape not seen in the picture. There is a passage in Landseer's large painting of "The Drive" very similar to this work.

WHISPERS IN THE PALMS: HYMNS AND MEDITATIONS. By ANNA SHIPTON. Published by NISBET & Co., London.

The eastern tradition of the palm tree is, that when its leaves quiver in the wind, they whisper the holy name of Jesus. This little manual of sacred thought and song has been prompted by the beatings of a heart "sorrowful yet rejoicing," and earnest in the desire that all should partake of the faith as it is in the Saviour, she has poured forth her whole soul, steeped not only in the reality but the poetry of Christian love in this volume. Many of the poems are suited to the capacity of childhood; others are eminently spiritual; but we have not lingered over a collection of such truth and sweetness for a long time: truly she resembles the palm tree, whispering evermore "the name of Jesus."

THE ADVENTURES OF THE CALIPH HAROUN AL-RASCHID. Related by the Author of "Mary Powell." Published by A. HALL, VIRTUE, & Co., London.

It is many years since we parted from our old friends with whom the "Arabian Nights" brought us into pleasant companionship, but we fancy we recognise some of the party in this volume, though habited in new costumes. The moral conveyed by the stories is good, and tending to promote the social virtues. The book, with its old-fashioned type, and antique style of binding, will be an agreeable change from the philosophical and learned treatises which, in the garb of children's books, we are accustomed to put into the hands of the young, in the expectation of making them wiser in their generation than their fathers.

THE ART-JOURNAL.

LONDON, FEBRUARY 1, 1856.

A FEW WORDS

ON EXHIBITIONS.

THE FRENCH AND OUR OWN.

Present—MAGISTER and AMICUS.

MICUS.—And what may be the artist's feeling as to the great Paris Exhibition, now that it is past and gone, and some time has elapsed to let ruffled spirits subside?

Magister.—It was a great benefit in affording a general view of the present state of

European Art-progress. I believe our artists so appreciate it. At any rate, none who crossed the sea to visit it could have regretted their expedition. One's own practice is directly affected by the opportunities of comparison it yielded between the tastes, aims, means, and results of the various schools.

Amicus.—Do you consider it afforded these in perfection?

Magister.—On the whole very well, but not thoroughly, of course, for several great European artists took no part in the show, and others were but indifferently represented; in some cases, also, whole classes of works were wanting: the Fresco Art of Germany, for example, the nature of which debars its removal. But, considering the magnitude of the idea of a Congress of modern Art, I think it was largely realised.

Amicus.—It is satisfactory, perhaps, to feel that the subject of modern Art was not wholly exhausted on this one occasion, and that there is something still to see beside what was contained within the plaster walls of the Beaux Arts. It takes the poetry out of a subject to define its boundaries precisely, and it is well to leave something to the imagination. It is very comfortable, in a cherished subject, to have this resource, this consolation to lean on; for the effect on me, I am sorry to say, of the mass of Art-work there collected, was not altogether pleasing. My spirits were jaded with so much to admire: one's cup of admiration is hut of a certain size, and the receptacle could not expand to so much at once, and thus each image had to content itself within a smaller compass, and so got jostled, and squeezed, and diminished in the crowd. Now, to do justice to a work of genius, it should reign alone, and have sole dominion for the time being; it should have free room to expand and fill the whole mind. I like to be thus carried away, and lifted up, as it were, off my feet, from this prosaic world, by the pennons of a great work, and to feel for the time as if it were part of my own being: but in those great halls I was pulled a thousand ways at once. The battalion—the army of works took away from the impression of each, as, in a martial review, you lose the individual man in the mass.

Magister.—As a matter of mere amateur pleasure, there is no question that viewing a few selected pictures is the best way, not only to do justice to them, but to gratify yourself. But now and then, as a *tour de force* for a nation, or for comparison, a great exhibition may have

excellent fruits, although a few works of Art you can make friends of, of course are vastly to be preferred to a crowd of such acquaintance.

Amicus.—Oh! the same thing holds in our exposition every year at the Royal Academy, as respects the grouping there altogether of such various works. In going round the rooms, the mind is called upon to be always jumping from great to little, and from grave to gay, and back again, and has to go through a series of sudden convulsions and transitions, in seeking to do justice to the labours of each artist. For my part, my powers are not facile enough to prance with ease from broad farce to pathos, or from pet lap-dogs, and dogs and horses, to a great historic or poetic effort; or from the Vale of Tempe, or the Ruins of Carthage, or the representation of some holy act of old, far back in the dim mystery of years, to the broad business city face of Mr. —, with his well-brushed whiskers. The first impression on me of our annual exhibition is that of a great jumble. I have sometimes thought it might be much better to put all the portraits by themselves, and all the historic and poetic works together, and make the still life, and the landscapes, and the dogs and horses, and squirrels and parrots, into separate clubs, and so on. Such a departmental arrangement might be worth trying; at any rate it would avoid the jarring I allude to, and allow one to go more calmly and philosophically through the show, in lieu of the present saltatory and right-about-face evolutions one is obliged to execute in following the pace and direction of each artist. It would afford more harmony in the arrangement, and I am sure the works would be done more justice to, and the whole would leave a pleasanter impression.

Magister.—You speak as one not knowing of the great and various difficulties of a hanging-committee's office: the many interests there are to attend to; the grouping of colours in the pictures that have to form one side of a room—for each side, though made up of a number of pictures, should form one harmonious picture and *coup d'œil* of itself—and then the size and comparative merits of the works, &c. &c. have to be considered. I assure you the arrangement of the annual pictures, especially within the short three weeks that can be spared for it, from the time of the artists who prepare, or those who arrange them, is an office of great difficulty, anxiety, and pressure, and a thankless one to boot. What you suggest may be very well in theory, but I doubt its hearing practice. In the first place, you speak of these *désagréments* purely as a "lover of Art," and it is from that point alone that you view the subject; but the Academy yearly exhibition is not addressed solely to the pure and earnest lovers of Art. If the funds of the Academy (which they redistribute so beneficially) depended on the shillings from these alone, they would not be able to keep their doors open! The Royal Academy annual exhibition is a great show and a lounge, as well as a haquet-room for the lovers of Art, and the mass of the visitors go to see the portraits of their friends, or wile away an hour or two, or to say they have been there, and to be amused, but not to think closely of or study the works; and the variety of images and characters in the very quick succession to which you object is part of the amusement and excitement to them. In such exhibitions, Art is in great degree addressed to the multitude, and must be so, like other public matters, to be successful. The general taste must so be catered for, and it is better to do so in the temporary arrangements of the works, than in their individual intention and execution. Besides, the real lover of Art can concentrate himself on one work which delights him, however close it may be placed to some incongruous effect.

Amicus.—He must not however indulge himself so at a full time of the day, or he will be a public nuisance to the ever-circulating crowd. To avoid this, I not unfrequently go in late. There is a sort of dreaminess about the late afternoon time at the Royal Academy, when each ten minutes is making the rooms thinner, that I much enjoy; when the softening light adds a deepening faith and illusion to the pictured forms, and one can go on gazing at an Italian scene till the blue sky and clear waves

seem real, and feluccas seem to be moving in the bay, and the thin smoke to curdle up from Vesuvius, and the whole vision appears to swim and glimmer in poetry before our eyes. I believe I am recalling one occasion when such a painted reverie kept me so late in the rooms that I narrowly escaped being swept out with the rest of the dust!

Magister.—The early morning time, also, as soon as the doors are open, has its advantages, and the atmosphere is pleasanter.

Amicus.—I will try that next summer, but it must be in clear, warm weather, for the morning's rays always seem to me here cold for works of Art. I like to be cooled down to business, and warmed up to Art. But there is another consideration about masses of works in exhibitions. Their numerous conflicting effects are such that I have but little faith in my critical powers in such an assemblage, and I have often heard artists say that a picture painted up to exhibition key, and looking very prominent in the academy rooms, is apt not to hear nearer and more intimate inspection so well as one elaborated with modester views, and that thus the "private virtues" of a work are not unfrequently sacrificed to its "public ambition;" I mean, that it will lose when removed to a private room, and that thus a public exhibition does harm sometimes, and is moreover by no means a sure test of the sterling qualities of Art.

Magister.—That is very true. To go through an exhibition cursorily, and say which is the best picture in it; or, still more, to apportion out with justice the degree of praise due to each remarkable work, were, indeed, an arduous task, especially so unless you have had great opportunities previously of studying the style and excellences of each master. In balancing, however, the advantages of exhibitions or their non-existence, you would find them to be mainly on the side of exhibitions. Public exhibition has, undoubtedly, some disadvantageous effects on Art, but it has far more than countervailing advantages: Art would soon dwindle here without public exhibitions.

Amicus.—I asked you a little while ago what was now thought about the Paris Exhibition at the Beaux Arts—I meant to include the awards, &c.—and you replied by a general acknowledgment of its benefit, &c.; you turned to the generalities you could praise, I fancy, to avoid the specialities which you could not; but may not what you have just said afford some excuse for some of the mistakes which have been so widely spoken of, especially as to the awards of the British portion, for I heard one of our best artists say, the other day, that the quantity, and variety, and style of our Art quite took our neighbours by surprise?

Magister.—You mean that their want of conversance with the qualities of our masters forms an excuse for their want of appreciation of them? Perhaps that is about the best excuse to be made for the juries.

Amicus.—And this were letting them down very easily. A tribunal, however, which was too much startled by the novelty of the case to enter into the evidence cannot be thought an adequate one. I should vote for an appeal and a new trial. The decisions, omissions, &c., have caused considerable ebullition in our artist-world. Is it not so?

Magister.—That is the part of the affair most to be regretted. It were much better had it been passed over by us in silence; there would have been no presumption in our quietly looking on on the desperate scramble among our neighbours for distinctions which really were no worth to us, and to which we should attach none of the value as possessors, which now we are apt to do as non-recipients. Every English artist who could go to Paris on occasion of the Exhibition was right to go—professionally—for the sake of study and comparison; he was right to cull from the Exhibition all the good he could obtain; but he was not right to be irritated with decisions that are only calculated to be a nine days' wonder, and which there is not the least chance of the world's endorsing. The acts of the juries of Art were self-destructive, and needed no word of ours for their conviction; for instance, some of the works which were wholly passed over, as

far as medals or mention goes, were already "standard works" throughout the civilised world, before they came under the arbitration of the juries. These, of course, are not in the smallest degree affected by the dicta of these gentlemen, whose judgment, on the other hand, is damaged before the world (their judges in turn) by their attempt to throw a slur on such works. The whole affair of medals, as regards us, too, is an anachronism: such affairs are out of date with us, and are almost worn out even for little boys from the kind hand of that grandfather of our institutions, the Society of Arts. Our artists desire but *employment, and present and future appreciation in reward of their efforts*; and if they stick to that text, their real and proper motto, they can afford to smile quietly at the little *contretemps* of the hour.

Amicus.—Well, it may be very wise for you in the profession, under the circumstances, to apply to these matters a philosophic diminishing glass, but they present themselves to me as great mistakes.

Magister.—Great or little, they will tend probably to advantage in discouraging medals and such like rewards for some time to come.

Amicus.—Would you include in such rewards to be discouraged, decorations of rank, such as the Legion of Honour?

Magister.—The artist makes his own decorations, and our paintings and sculptures are our true stars and garters. But such decorations of rank are of a different character altogether to medals. What I object to in these last is the direct struggle into which the best artists are forced by them, and of which there is no arbitrium but themselves capable of judging—except that of matured public taste, which is the inevitable and ultimate judge, an all-sufficient one, too. Why, then, thrust us into any other? It does not, I really believe, benefit Art: it kicks up all the dust of the arena, and smacks more of the prize-ring than of the quiet emulation by which the higher regions of the Art are to be sought. Let us have great exhibitions now and then, if you like, and I am sure I shall be very happy to take part, in my small way, with the one they talk of to be in Vienna, but let there be no prize medals. A new feature for a repetition is a great thing, and Austria will have, at any rate, that opportunity of novelty, the absence of medals. On our part I will answer for it there would be none the less exertions made to be well represented from the absence of medals of merit, but the contrary; for I doubt whether our artists, as a body, would now enter into any scheme that might have similar ungraceful results in this respect to those on this last occasion. But you were speaking of decorations of rank: there is not so much to be said against them, for they are not put up to public competition, like a hat at a fair, on a slippery pole, but are presumed to be free and unapplied for honours, conferred by royalty on merit. But they are apt, from their nature, to be abused, and their value lessened, by being given away in numbers.

Amicus.—Yes; you see very queer people, indeed, in France decorated with the Legion of Honour! I hope if the "Order of Merit," the "O. M." attached to the name, be eventually created here, which has been so often spoken of as our forthcoming decoration for *intellect*, in contradistinction to the knighthood so often bestowed, on mere *occasion*, that it will be given away more charily and carefully than its analogous antecedent has been in the course of years in France.

Magister.—It is evident, however, that this distinction has been given in some cases by the Emperor, at the last moment, to make up some of the lapses of the juries. Our monarch had no such resource on the occasion of the '51 Exhibition in Hyde Park.

Amicus.—No; the knighthoods and C. B.'s were not conferred for that reason, but perhaps it was not then so much wanted, for we did not err, I believe, in retaining the lion's share of the rewards for our own country; at any rate, I heard it said in many quarters that our juries rather gave the down-scale to foreigners, especially in Art-manufactures, and Art itself, in as far as sculpture could repre-

sent it; and, perhaps, it was much better it was so.

Magister.—Up to a certain point the feeling dictating that is very well, but if acted on to any great extent, it is productive of serious harm, for our competitors are not apt to give us much credit for generosity, or to rank us higher than we place ourselves. As medals were then decided on—although the last act of the lamented Sir Robert Peel was to reduce them all to bronze ones, showing his animus against them—as medals were then unfortunately decided, for their adjudication was the least satisfactory thing about the whole Exhibition—the best thing (as it is in all cases) would have been to have adhered to exact truth and justice, as far as possible, without turning to the right or left, and without any Quixotic generosity.

Amicus.—Yes, there are certain things in which the Briton is apt to be overweening of himself and his country, but certainly estimation of native Art is not one of these. In his own idea he can fight better than any one else, if he is put to it, although he also deems he is very peaceable, which delusion he illustrates by being in almost every war through the world. He thinks, also, that he can produce the staple of manufacture and machinery better than any other nation under the sun; and it is, perhaps, from a secret feeling that he is a little presumptuous in these claims, and from a desire to make up for it, that he is ready to sacrifice all the pretensions of his own country to Art or Music. He fancies he understands his own character, and that he is a strong-minded, sensible, courageous, beef-fed person,

"Broadcloth without, and a warm heart within,"

who can, as far as substantial goods, take the van of all the world; but, as to the lighter elegancies, he is very magnanimous in trumpeting forth his own inabilities, and sacrificing at the shrine of this apparent liberality the hopes of many of his own sons, who are striving head and hand to make up the deficiencies of which his loud voice seems almost to boast. Is it not so?

Magister.—The real Art knowledge that is now spreading slowly but surely in this country is tending, I trust, to silence this cry, and induce people to take fairer views. Apropos of what we have been talking of, I see a strong element of hope of this in the way in which the adjudication of awards on this occasion has been taken in this country, not only by the body of artists, but by the press and the public, who have anything but endorsed the decisions. Indeed the bill drawn on our belief has assuredly not been honoured. This evident reaction is an evidence of the growing consciousness of the substantial qualities and truthful unaffected vigour of our own style of art, for, after all, a country must be true to itself, to do great things in any way, and it must be mainly the patron of its own Art if it is to retain and develop fully a national style: at least it was so with the Greeks and Italians, &c.

Amicus.—But excuse my again recurring to these awards. Do you consider the mistakes and omissions that were undoubtedly made on this late occasion arose from carelessness or want of judgment on the part of the juries; or was there any settled plan that gave rise to the result; and were our artists to blame?

Magister.—I will first premise that our artists were, perhaps, rather inclined to hang back on the threshold of the proposition, when first invited to take part in the Paris Exhibition. They were somewhat slow, perhaps, to be imbued with the importance of the great *concours*, and this had some effect, doubtless, on the eventual show they made. On the other hand, as regards the action of the French juries, doubtless they were not prepared to witness so much individuality and progress in English Art, and there was at first a disposition to smile at us as eccentrics, but the Nature in the British works was not to be smiled down, and so the affair took this turn: they ended by allowing us merit in the lower branches of Art, and giving us seats on the lower forms, but kept all the high seats of Art for themselves. The British, they were fain to convey, are not great artists in the highest sense of the word: they fail in the poetic, the

historic, and epic; but in the quaint representation of every-day life and of every-day things we allow their excellence. They smiled approvingly—although here and there a strange want of recognition was even here shown—on our landscapes, our portraits, and our dogs and horses, &c., but bristled up in opposition at any approach on our part to the "heights" of Parnassus. We might gambol as much as we liked in the meadows below, but must not presume to ascend the hill. "That is your region, this is ours," was the secret watchword; this was the stamp desired to be impressed on British Art,—and this is, I believe, the clue that will unravel the labyrinth of the awards—The Key of the Mystery, and one that will fit pretty nearly every case throughout the painting decisions, and is specially indicated by the case of the British sculpture as a mass—which, being composed nearly wholly of poetic works, they put out of court altogether. Moreover, I may add that these views were especially emphasised by their signal notice of what has been called the "jockey part" of our contributions, the highest rewards having been bestowed both in oil and water colours, on pictures of animals!

Amicus.—Truly we are a sporting nation, and this is one of the very few points on which the French are ready to look up to us, and so they thought, perhaps, this would give a sort of psychological truth to their decisions.

Magister.—And thus to be greeted at least with "si non e vero e ben trovato." But it is best for us to forget all about it. I am sure we forgive it already, and shall never treat a French picture the worse in any exhibition of ours from a remembrance of the mistakes of '55.

Amicus.—In the kindred branch of Art-manufactures, how do the awards to the British bear reviewing, or give satisfaction?

Magister.—I believe, on the whole, better; I could not, however, but remark that it was those among our Art-manufacturers who employ the most French hands that were selected for reward.

Amicus.—But there may be some just reason for that.

Magister.—We will not enter on that now. One fact, gratifying and flattering to ourselves, I thoroughly believe: our immediate neighbours have a very different appreciation of our Art now than they had before the Exhibition, and they would be prepared to give a very different welcome to it on another occasion.

Amicus.—Do you, then, think our artists would join in another such exhibition?

Magister.—If there were no medals of merit, I believe they would, but not just now; we have had enough of great exhibitions for the present. Suppose, however, such an occasion were to occur again within a few years. A medal of recognition and thanks to each exhibitor would be very well, and also that careful reports should be drawn up of a readable and popular nature, and not in the "blue book" style, of each class of Art and Industry displayed. I would have all the hitherto expence of medals of merit applied to these purposes, and to the affording increased facilities for appreciating all that might be seen and learnt on such an occasion. As it was, my feeling as to the great Paris Exhibition of the year 1855 is cordial thanks for the opportunities it afforded me, and the benefit I derived from it. I am only sorry we did not meet there.

Amicus.—We missed only by a day or two; but there is a pleasure in comparing notes now. I was told during my stay that there is a growing feeling in Paris that France has seen her best days in Art generally, and that she is not improving; that she is too commercial, and works now more *pour la poche* than *pour la gloire*.

Magister.—It may be that other nations are coming more up to her, or that she has more opportunity of seeing what they have done and are doing; but I see no signs of any falling off in the oil-paintings, although it may, perhaps, apply to some other parts of Art, such as small sculpture and ornamental decorative works of the various kinds that Paris makes for the world. The historic oil-paintings of the present day in Paris are quite up to the mark of former times; and various other branches of Art, comparatively

novel, appear to be followed even more successfully than heretofore.

Amicus.—But do you consider French taste healthy in Art?

Magister.—Healthy for us? Ah! that is a large subject, which we will not enter on now, for the daylight is very short this time of the year, especially for us brethren of the brush, with the spring exhibition in the horizon.

Amicus.—

"You see a hand I cannot see,
That beckons you away,"

a hand holding one of Messrs. Roberson's best brushes? *Au revoir.*

RECOLLECTIONS OF DANNECKER.

THERE are few things more pleasant to behold than a healthy, happy old age. And when, added to contentment for the experience and the many blessings that a long life has brought, we find a lively sense for the beautiful in nature and in Art—the mind still fresh, though the body be fading—the charm is then quite irresistible: we are drawn towards such a one with reverential affection, and forget in converse with him the wide space that lies between youth and age. And it seems the especial privilege of genius to remain thus ever young. It is the fresh spring imparting everlasting youth.

On Dannecker had this divine gift been bestowed. At near 80 years of age he possessed the warmth of feeling, the elasticity of mind, the pleasurable sense of the beautiful, which we generally look for but in hopeful manhood. He loved to be with the young, and to see and hear their enthusiasm; for his years pressed not heavily upon him, and at heart he felt as fresh and as buoyant as they; and his undimmed eye would sparkle, and over his countenance a flush of brightness would spread, as he talked of what he had done; and by his manner, his voice, and his words, one might have supposed that he was about to start upon the race, and not that it was already run. There was a fire within that prevented the ice of winter from forming. The genial warmth kept not only the blood in his veins, but his affections and sympathies in a strong and equal flow. The selfishness that comes upon us by age he seemed to have shaken from him. He was keenly alive to the remembrance of past friendship, and when he spoke of Schiller it was with all the intensity and fervour of a first love. His name recalled at once the days when they were together. Schiller was again in his presence, radiant and full of life, and the separation of years and of the grave had dwindled down into a recent yesterday. "He was his dearest friend," he said; "they had studied together—here at Stuttgart—at a school that the king had founded." And all the circumstances attendant on making the bust of his friend flashed at once on his mind. "Schiller said to me, 'You must make my portrait,'" so the happy old man began to relate, "and I answered 'Yes, I will: come to me to-morrow morning early,'" he continued, with an arch look, as if pleased at having managed it so cleverly; "I told him to come early, because I knew that he would then be fresh, and by thus coming to me he would be obliged to go into the open air, for he did not live very near me, and would have some distance to walk. And so he came, and he was excited and pleased, and when he entered my room with a light elastic step—his eye bright, and his whole countenance fresh and cheerful, and his hair off his temples—I determined to make him as he then looked; just as he was when he came in asking for me."

I remarked to Dannecker, that Schiller's brother, who was still living, was very like the bust.

"Yes," he answered, "but much stouter. He is a man who rides, and walks, and shoots, and goes about, and is much in the open air, and is out early of a morning, and that makes a man look burly, doesn't it? But Schiller," he continued, "studied all day long, and night too, sometimes, and so he was thin," he observed,

putting his hand to his face, and drawing it down over his cheeks. "Have we nothing of Schiller up-stairs," he asked of his wife, in order that he might show it me; but it seemed there was nothing that had belonged to him at hand.

The bust of Schiller was in a small room adjoining that one where the other works of the sculptor were arranged. It was veiled. On removing the covering, you might perhaps be struck by the size of the bust, which was much larger than life. But what a majestic countenance! How full of life,—beaming, too, with expression of the noblest kind! How large the forehead, how high and capacious, extending unsinkingly to the very temples, uncovered by the blow-back hair! The temple is undulating, and you see the full vein creeping underneath. In the mouth there is great benevolence and sweetness, and its expression is gentle and benign. The face is full of "traits," and you soon understand that it was not possible to make it on a smaller scale.

A strange feeling possessed me while in that lonely room, in presence of the veiled bust, and I trod cautiously, as though moving along a chamber where the remains of one whom I had loved were lying.

Dannecker was of short stature, but hale and hearty, although so old. His face was rather flushed, like that of a man who has lived much in the open air. His eye—what fire and lustre were there! His whole countenance was brightened by it. He had gray hair, which fell back in long, venerable locks. His forehead was broad, and resembled Schiller's, except that it did not extend, like his, to the very temples.

He spoke about Art and of Rome. Putting his face close to mine he said, whispering rather in an earnest manner, "These feet of mine carried me to Paris, and then to Rome. Yes, I was four years at Rome; I should have liked to stay longer, but I could not; the king sent for me to come back." And by his manner it was clear that though he would have preferred to stay at Rome, he felt pride and pleasure in being recalled to his native country by his sovereign. "I was sorry to quit Rome," he added, "but I was very grateful to his Majesty."

Of Schiller's bust he said that he would not part with it, that he should always keep it by him. "It shall not leave the country; it must remain in Germany, in this land of Wurtemberg. It shall remain here in Stuttgart," he exclaimed with the greatest energy, his fine eye sparkling with a look of triumph, as though he felt that his name and Schiller's would hereafter be mentioned together, and be united in the memories of their countrymen. He told me he had been often asked to sell the bust, but he would not: "Nothing in the world should make him do so. No," he said, "I must keep it."

When Lady Murray was at Stuttgart, she went often to visit Dannecker. He said, "She has a work of mine, *Psyche*. She was a great friend of sculpture. Here," pointing to an engraving of one of Canova's works, "Canova sent me that. Lady Murray brought it me from Rome. How beautiful it is! How fine that hand pointing to heaven, and this drapery, too! Oh, Canova was a most loveable man; he was so good and so friendly. And he was merry, too, and full of life. Sometimes he would run into my room on tiptoe to surprise me," and as he told me this, his eyes sparkled with pleasure at the recollection of those happy days. "Oh, yes," he added, "Canova was a kind man!"

On taking leave of Dannecker, I asked permission to come again, a request which he readily granted. "Certainly, come when you like." The man who was at work below told me that during the last six months Dannecker had done nothing; but that no piece of sculpture ever left his house without his own hands having worked at it. There was one most beautiful work there, a recumbent figure of *Sappho*. He had sold this; but he had caused it to be rebought. How artist-like—how like my own dear friend, John Constable!

Friday, June 18th, 1837.

Went again to Dannecker's. He was at the window in his usual white jacket and white

waistcoat, as I crossed over to his house. After I had been some time in his atelier, he joined me there. I was in the little room where the bust of Schiller was placed, and sitting before it. After he had shaken hands and shut the room door, which he had left open on entering, he seated himself beside me before the bust. After a while he rose, and standing on tiptoe told me to do the same, and so look at the bust from above. Then I was to look up at it, and then into the face, and then at it in profile. It seemed as if, while looking on that countenance, the gulf which was between them was forgotten.

He afterwards spoke of his "*Ariadne*," and asked if I had seen it. I told him I often went to look at it. "It was quite by chance," he said, "that I came to do it. It was a curious circumstance. At that time I had my atelier in the palace, and there was a young girl there the most beautifully formed of any I knew. So I asked her if she would sit to me. She said 'Yes,' and she did so with drapery. I then asked her if she would sit to me uncovered. She said she would, if I would make something particularly fine. Well, I came home and thought about it, and at last I determined she should be an *Ariadne*. I made a sketch, and I said," (speaking with much energy and fire,) "she shall sit upon a panther. And so I made her."

There was a model of the statue in the room, and we walked round it. "Stoop down," he said, taking hold of me when we came to the feet, "stoop down, and look upwards: look how high it seems to be." And he then led me behind and made me observe the fine flowing line of the back. In the adjoining room was the beautiful figure of "*Sappho*." He dwelt upon it with a most complacent look. "He had sold it," he said, "but afterwards his wife rebought it. She would have it for herself: it is hers, not mine." There was, too, a group in clay of "*The Fates*," a mere sketch, but very fine indeed. One figure was spinning the thread; another, who was holding it, looked astonished as she turned and saw the third, who held the fatal shears, calmly sleeping. It is an exquisite group. "She ought to cut the thread," said Dannecker, "but she sleeps." "You might make something wonderfully fine of that," I observed. "Yes," he answered, in a low, significant voice, "but I have no more time!" I knew what he meant, and said nothing. C. B.

RATSBON.

CORRESPONDENCE.

To the Editor of "THE ART-JOURNAL."

BOOKBINDING.

SIR,—Since symmetry is so commonly allowed to be a main element of beauty, I have often wondered that so little attention should be given to it in the binding of books, and especially in the divisions and lettering of their backs. We have books with backs of sundry numbers of divisions, from four to seven, though they are most frequently five or six, and with lettering-pieces at divers places, from the middle division of the odd numbers, to the uppermost but one of all of them; and we have books in boards and cloth, with lettering-pieces of seemingly accidental widths, if they are at all commensurate with the backs of the book, and placed at heights which bear no intelligible proportion to those of the volumes to which they are attached. I have lately applied harmonic proportion to the back-binding of books, dividing the back into six band-spaces, and placing the lettering-piece on the third from the top. Then, if we call the whole height of the book 1, the space below the lettering-piece will be $\frac{2}{3}$ or $\frac{1}{3}$; the space above the lettering-piece will be $\frac{1}{3}$ or $\frac{2}{3}$; and the width or height of the lettering-piece itself will be $\frac{1}{6}$: and $\frac{1}{6}$, $\frac{1}{3}$, and $\frac{2}{3}$ are the reciprocals of 6, 3, and 2, which are a harmonic series. If it were useful to attach a second lettering-piece, it might be placed on the third division from the bottom, and it would still preserve the harmony of the spaces. I usually choose the respective colours of the binding and lettering-piece upon authorities afforded by nature for the juxtaposition of colours. W. BARNES.

DORCHESTER.

THE ROYAL PICTURES.

THE WOLF AND THE LAMB.

W. Mulready, R.A., Painter. C. W. Sharpe, Engraver.
Size of the Picture, 2 ft. by 1 ft. 8 in.

EXCEPT by a comparison of one with the other, the old maxim "Life is short and Art is long" will not apply to Mulready and his works: for more than half a century—an unusually lengthened period in Art-life—he has devoted himself to his profession, with an assiduity and zeal rarely known; and each year of that term has, almost without interval, produced something that will perpetuate his name among the great painters of the world. And the most remarkable feature in his career is that with advancing years he appears to have been imbued with increased powers; his whole life seems to have been one of progress towards perfection, as if he felt that he had always something to learn—that there was some point of excellence to be reached which, as yet, he had not attained to. Half the secret of his success may be traced to the manner in which he embarked on his course; he set out with certain defined principles of action, so to speak, and to these he has constantly adhered, so that the differences which the various epochs of his Art may show are not alterations of style, but progress in that he commenced with. Colour and execution are the results at which he aimed; and if we examine a picture of any single year, we shall find it was the best he was capable of producing at that particular period, his latest works being those wherein these two qualities are the most conspicuous; while even his earliest pictures exhibit a depth and force of colour which are found in the productions of other painters only after a life-time of severe study. We remember seeing at the Royal Academy, a very few years ago, two little pictures—views at Kensington, which were painted in 1813; they are simple scenes, but so extraordinary in execution and feeling, as to place them at once on a level with the very best works of their class of any age or country.

Yet it must not be supposed that Mulready's art is limited to the mere materialism of painting, and that he has had no higher motive than to excite admiration by the brilliancy of his colouring, or surprise at the elaborateness of his manipulation: in these qualities some of the old Dutch masters may equal, though none surpass him. His humour is rich, natural, and delicate; his sentimental narrative, graceful and touching; so that we scarcely know to which class of subject to give the preference. Both are studies not only for the artist, but for those who desire to read the philosophy of human life; the former will find in them the very highest qualities of his Art, and the latter will discover, among the groups that make up his subjects, something beyond the types and shadows of individual character. Mulready is the "Æsop" of painters, inasmuch as beneath all his figurative expressions lies the moral of truth, fashioned indeed after the similitude of a fable, but easily discerned and applied.

What a story, for example, is told in the picture of "The Wolf and the Lamb," already well-known from the engraving by Mr. J. H. Robinson, published many years since, the plate of which is, however, destroyed. That wolfish boy—he has outgrown everything he wears—is the terror of all in the village; he is always ready to do battle, save in a righteous cause, and when his opponent is bigger than himself; his hair, his collar, his coat, and his sleeves, are all turned back, expressive of defiance; in his haste to place himself in a fighting attitude, or more properly speaking, a bullying attitude, he has burst the strap of his trousers, while his countenance exhibits the most perfect embodiment of juvenile tyranny. The other, a meek-looking—but, we will venture to assert, a well-disposed lad—is possibly "the only son of his mother, and she a widow;" the little girl is his sister, whose cries for assistance have brought their parent to the door of the cottage to rescue the "Lamb" from the fangs of the "Wolf." The whole picture is full of natural incident expressed in the most felicitous manner.

It is in the collection at Buckingham Palace.

OBITUARY.

JEAN PIERRE DAVID (D'ANGERS).

THE French papers announce the death—on the 6th of January, at Paris—of this eminent sculptor, whose name ranks among the highest of his native school.

In the *Art-Journal* of August, 1847, appeared a long biographical sketch of him and his works. We must extract from this history the principal events of a long and well-spent life, referring our readers who desire acquaintance with its details to the previous account. Jean Pierre David was born at Angers on the 12th of March, 1793. His father, a wood sculptor, was unwilling to subject his son to a profession from which he himself was able to procure only a comparatively scanty provision for a large family. All opposition, however, to the strong inclination of the lad, who would be a sculptor, proved fruitless—he had attempted to destroy himself because his father would not yield to his entreaties—till at last he left home with the blessings of his parents to encourage him, and entered Paris at the age of eighteen, with nine francs in his pocket, the whole capital wherewith to commence his career of art. Soon after his arrival in Paris he attended the ateliers of his namesake, David, the painter, and of Roland, the sculptor: within eighteen months of his quitting home, he had gained a medal at the French Academy, and been favourably noticed by the various professors. In 1809, his native town voted him an annuity of 600 francs to enable him the better to prosecute his studies. In 1810, he bore off the prize for the "Head of Expression," and the second prize for sculpture; and in the year following the great prize, that of Rome, was awarded to him for his relief of the "Death of Epaminondas." During his five years of study at Rome, as pensioner of the Academy, he attracted the attention of Canova, who thought very highly of the talents of the young Frenchman, and whose works were held by David in the greatest veneration. When the latter returned to Paris, in 1816, the sight of the restoration of the Bourbons—for he was an ardent Napoleonist—and of the allied forces at the gates of the city, induced him to come to London, trusting that through Flaxman he might find the opportunity of dedicating his genius to Britain. Flaxman, however, took it into his head that the young sculptor was somehow or other related to David, the painter, whose ultra-republican principles he detested. Flaxman gave him a cold reception, so there was no hope for him in that quarter; and an offer, as it was said at the time, which was made to him by some individual in high position to erect the Waterloo Column, so disconcerted him that he immediately sold all he had brought over with him, and returned to Paris.

Once more in his native country he set earnestly to work, leaving politics to take care of themselves, notwithstanding he still retained his strong party feelings. We can only enumerate his principal works in the order, or nearly so, in which they were executed. His first great work was a statue of Condé, placed in the first instance on the bridge of Louis XV., and subsequently transplanted to Versailles; this was followed by a group of "Christ, the Virgin, and St. John," for his native town; the "Twelve Apostles" for the chapel of the palace at Vincennes; four bas-reliefs for Fontainebleau; a frieze, 101 feet in length, for the Place Bastille, since removed to the Arch of Triumph at Marseilles; the statue of "René, the Good," King of Sicily, at Aix; three bas-reliefs and a statue of Feneclon, at Cambrai; a statue of the Vendean hero, Bonchamps, in the church of St. Florent; a monumental statue of General Fox, with four bas-reliefs, at Père-la-Chaise—a gratuitous work of the sculptor's; statues of Corneille, at Ronen; of Cuvier, at Montbéliard, and at the Jardin des Plantes; of Jefferson, at Philadelphia; of Talma, at the Théâtre Français; of Racine, at Laferté-Melon; of St. Cyr, at Père-la-Chaise; of Carrel, at Ronen; of Philopœmen, in the garden of the Tuileries; of "St. Cecilia," in the church of St. Maurice, at Angers; of Bichart, in the Hôtel Dieu; of Marshals Lefevre and Suchet, &c.

The busts and medallion portraits by David are too multitudinous to particularise here; they include a large number of the most distinguished characters of Europe, contemporary with the sculptor.

In 1823, the king wished to confer on David the Cross of the Legion of Honour, but he modestly declined the honour, on the ground that he had not yet deserved it; in 1825 it was accepted. In 1826 he was elected member of the Institute, and soon after professor at the *Académie*. In 1827 he again visited England, where he was cordially received,

and where he modelled the heads of many of our distinguished countrymen. In 1829 and in 1831 he travelled into Germany, for a purpose similar to that with which he visited England. To this period of his life belongs his famous statue of Gutenberg, at Strasburg, with its powerful bas-reliefs; of Jean Bart, at Dunkirk; and the group of Xavier Bichat, at Bourg. Perhaps the statue which David most delighted in was that of Barra, a young Republican drummer, who fell in the wars of La Vendée; it was destined for the Pantheon, but was not placed there, nor do we know what has become of it.

On the wall behind the chair on which the writer is penning this brief and imperfect tribute to the memory of a great artist, hangs his portrait; it is that of a man of genius, stern, and somewhat imperious in expression, but earnest and enthusiastic. This earnestness and enthusiasm were the great features of his character, and bore him onwards to success. Sternness was far from his natural disposition, though hasty, and somewhat intolerant towards those who differed from him in politics. But he possessed the attributes of kind and generous feelings, sympathised with the distressed; was liberal towards the young and aspiring artist, and open in the avowal of his sentiments, whether to friend or enemy.

SUGGESTIONS OF SUBJECT

TO THE STUDENT IN ART.*

BY AN OLD TRAVELLER.

CHAPTER II.

The Sculptors in Council—Agesander and his Sons, Athenaodorus and Polykretes—Imelda Lambertazzi—The Brothers' Visit—The Lady's Dwarf—"In their death they were not divided"—Vienna and her Lovers—Friendly Criticism, of a learned German—Our "Brandy-Maidens"—Prague and its Painters—Sigismund's Safe-conduct—The Martyr's Friends—Frederick of the Palatinate—The Winter-King's Banquet—Bohemian Critics in Art—Sculpture Galleries of the Vatican—The Nile and his Children—Barks of the Nigamies—The One Fault of our Mother-land—"Floreat Etona"—Hal has come!—John of England—The King's Justice—Alice will not marry—Sculptor or Painter—Giorgione to the Rescue!—Egeria—The Camœna Listening—The Nymph in Sorrow—Hippolytus and the Dryads—Approach of Artemis—Consolation and Deliverance.

MORE frequently should those, who now uphold the empire of Art, be found offering homage to the glories of their Great departed. All honour to the artist—worthy of the name—who devotes pencil or chisel to the memory of the mighty dead, and who gives to these later times the form, the face, the living presence of one who has illumined the past.

Have we then a painter or a sculptor who can do this worthily, as regards him to whom the whole broad world is debtor for one of its richest treasures in Art?—"as regards them"—perhaps, we should say, since it is of the creator of the Laocœon, of Agesander, and of his sons Athenodorus and Polykretes,† that we speak.

The sublime master and the sons who have not degenerated from such a sire—contemplating the well-nigh completed work that was to bear their names triumphantly through all time—surely these may form a company well fitted to occupy the nights and days of one whose soul, vowed to Art, can worship only in the presence of her highest manifestations; and we know that we have among us some who feel that they may aspire to treat such themes.

It is to the Sculptor that this grand and glorious Council of Sculptors would seem of right to belong, and even at this moment who shall say that its reproduction is not in the heart of one, who does but wait until he shall find such marble as he can hold to be pure enough for so lofty a work! Let the day come! but, meanwhile, we are content to accept the life-giving canvas. See only that it bear the magnificent forms of those immortal sculptors; let us have their noble heads, with the light of his genius irradiating each brow, and all praise to the painter who shall enrich the coming ages with a gift so valuable.

* Continued from p. 16.

† Called also Polydorus.

W. MURRAY, R.A. PINCE

C.W. SHARPE, SCULPT

THE WOLF AND THE LAMB.

FROM THE PICTURE IN THE ROYAL COLLECTION.

LONDON: PUBLISHED FOR THE PROPRIETORS.

Few cities, even of romance-inspiring Italy, present a richer abundance of picturesque memories than does Bologna. And among these, the well-authenticated story of Imelda Lambertazzi might commend itself to the student of pictorial effect with a force of appeal scarcely inferior to that of her who has made of Verona a shrine for the pilgrim of Art in all ages: but where hath been the bard to chronicle its details? "And Echo answers, where?" The history of Imelda would seem to have lain concealed beneath that dust which ever accumulates over the mere dry annalist; or, if touched on by more attractive authors, it has been so slightly, as to awaken no responsive chord in the great heart of the masses; neither will the simple mention of its unhappy close, to which our present purpose confines us, be more than the driest detail of facts;* yet from these may the painter assuredly derive some matter for his musings.

Imelda Lambertazzi was a daughter of that family whose then chief was the head of the Ghibelline faction in Bologna, yet she had met, and fatally been taught to love by the young Bonifazio Geremei, whose noble house stood paramount among the most zealous of the Guelfic party. A secret marriage had united the lovers; but their stolen meetings were betrayed to the family of Imelda by the treachery of one she trusted; and her brothers, forcing their way into her apartments, attacked the unarmed Geremei with their daggers. Declaring to their sister that their weapons were poisoned, they thus sought to deter the unhappy lady from placing her own slight form between themselves and their victim. But the warning proved vain. Imelda threw herself before her husband, and is supposed to have received some injury from the poisoned daggers. Be this as it may, Geremei was despatched, and his body was dragged to a distant part of the palace, where the murderers left it in a vaulted chamber, there to await some more convenient season for burial.

They had been followed by a dwarf in the service of Imelda; and this poor creature, returning to his mistress with tidings of the place where her husband's corpse was laid, conducted her to the vault, when the means by which Eleanor of Castille is popularly, but erroneously, said to have saved the life of our own Edward I. in the Holy Land, were eagerly adopted by the unfortunate Imelda. And her happy husband did awake to consciousness; but it was only to acquire the certainty that his wife had sacrificed herself in the vain hope of saving him. The poison she had imbibed, aided, perhaps, by that received from the weapons of her brothers, had already begun to produce its effect; and the priest, who had performed their marriage rite, sought by the faithful dwarf, could but arrive in time to discover the pair so fondly united in their lives, thus dying together. From his hands they received the consolations of religion; and the last sigh of Geremei was exhaled in a blessing on the wife who had so dearly proved her faith. The feeble arms of the expiring Imelda were then twined around her insensible lord,—both happy, at least, in that they were delivered from the pains of separation by the pitying hand of death.

More than one of Imelda's compatriots, with whom these incidents have been discussed, in the city of her abode, have pointed out moments in the same, well calculated to attract the notice of the painter. These have varied as differed the tastes and feelings of the speakers; but all have agreed that many pictures were to be found in the story; their selection and treatment we leave to the artist.

"Rich and rare," without doubt, are the attractions of the Austrian capital; yet they have, for the most part, received their full meed of praise, and in some instances have been lauded much beyond their deserts. Vienna is a brilliant city, nevertheless, and "abstraction faite" of all the

exaggerated eulogies bestowed on her by the more ardent of her lovers. Fair collections in Art enrich the princely palaces of her great nobles; and the courtesy with which these are offered to the inspection of the foreign guest, is no slight addition to the pleasure they convey.

Revisiting one of the most important of these collections, after the lapse of some years, the present writer listened, with pride and gratification, to the admiration expressed for the Galleries of our own high Magnates, by one whose fiat is, in such matters, held to be conclusive. But the remarks of the same speaker, on our periodical exhibitions—those of the Royal Academy and other institutions, that is to say—although pleasing in the main, were, in certain respects, less flattering to the English ears of his auditor, while the impression they made was all the more lasting, from the known disposition of the reluctant censor to see every thing produced by England "en beau." The undeniable justice of these friendly strictures gave them added force. Let us try if we cannot profit by them.

"Why will so many of your really clever painters give themselves to the delineation of fat red boys eating what you call *the drompling*, or to that of your 'brandy-maidens' *et id genus omne*?" quoth my colloquist, not exactly familiar with our idiom, but coming, nevertheless, very near the true character of the subjects deprecated.

"You would surely not prohibit incidents of ordinary life?" returned his interlocutor, knowing well that he had no such desire, but unprepared at the moment with any better defence.

"Certainly not; but neither will I permit them to push all other incidents from their stools," was the smiling rejoinder. "Here have I been delighting myself with the many great and excellent qualities exhibited by your artists in the —, and the —, and the —," he exclaimed, in continuance, running over the names of some half-dozen among our exhibitions of that year, "but in every one I find more or less cause to regret the predominance of the subjects in question, while you neglect another class of themes, to which no school of painters could do more effectual justice than your own."

"I do not mean the Grand Historical," he continued, referring to a remark he had been previously making, "but rather to what we will, if you please, call the Domestic History of Nations. And I ask you if your annals are not amply rich in events of interest worthy to be commemorated?" They are, without doubt. And the earnest speaker rapidly adduced several more or less familiar incidents from our history, in proof of his assertion. "Is it, then, that your artists do not read, or must we suppose that the brandy-girl appeals with more success to your national tastes! Ah! it is *not* brandy she wills to give you!—perhaps not; but do not let us split straws (this in reply to a most stupid attempt at explanation on the part of his companion—mine unworthy self, *videlicet*). I grant you, too, that she is piquante and pretty, that sherry-girl, since you say I must not call her a brandy-maiden, she does veritably offer 'an excuse for the glass,'* as your good comedy has it; but your able artists should more frequently do themselves the justice of handling higher themes. You have seen the exhibition at — this year, I know, and at —, and at —, and I think also at —?" And my interrogator enumerated certain continental cities, *not of the first class*, whose academies he had recently visited. It was true, I had seen them all, but of the exhibition in the last-mentioned, I insisted that it was not worthy to be named with the least meritorious of our own.

To this my friend agreed; but he added, "It is for that very reason I cite it, since *even there* I ask you if you did not see a class of subjects, whereon the genius of your artists would have produced an effect widely differing from that which justly dissatisfied you at —?"

There was no denying the fact; nor indeed

had the writer failed to remark it, or to draw the inference, as now drawn by our friendly critic, whether before or after his words had been spoken. Being at Prague, for example, some short time subsequently to the conversation here partially repeated, we were reminded of its tenor by many a pleasant example of the tendency to choosing incidents of the domestic history of their nation, evinced by the gifted painters whose works were then exhibiting in that quaint and beautiful old city. Here is one, of which the interest is common to every Protestant people of Europe.

The Bohemian painter, Jawurek, takes for his theme that most sorrowful of episodes, the judicial murder of John Huss, at Constance. He does not harrow the soul of the spectator by permitting the victim to be seen amidst the glare of those fires, kindled to prove the worthlessness of the Emperor Sigismund's safe-conduct; the point of time chosen is somewhat later: the crime has been consummated; the name of the dishonoured potentate has become the by-word of the future (for, with every tale of Imperial treachery that has since appalled the world, this deed of darkness is recalled, to *his* infamy), and we stand on that desecrated spot, where the pile of martyrdom is scarcely yet extinguished. There with us, are two grave and majestic forms, profound grief speaking from every feature of their faces, and ineffaceably impressing a sorrowful recollection of both on the heart of the spectator. They are but two, and the scene is but a desolate waste, from whose outraged soil they have gathered a poor handful of ashes, the mournful token which is all they can now bear to expectant Prague of that loved and treasured son, whose safety had been solemnly confided to their protection by the reluctant and anxious city. Yet is what we behold of the highest significance; for these are the bereaved friends of the martyred saint. They are the Counts Von Chlum and Von Dnbe—those trusted and honoured men to whom Prague committed the guardianship of her valued teacher when she snuffed him to leave the safety of her walls for what was known to be a service of danger, but from the perils of which she fondly believed him to be sheltered by the ægis of Sigismund's imperial honour.

The picture is an admirable one, and presents a perpetual lesson, whether to princes or people; beautiful it is, too, and full of various merits as a work of Art; but of these we are not now to speak; it is with the subject alone that we are now occupied.

Frederick the Elector Palatine, rising from a banquet to receive intelligence of the defeat of his army at the Battle of the White Hill, is a work presented in the same exhibition. This is by Cernaek, of Prague, and is of value, inasmuch as that it commemorates an event of incalculable importance—one which materially affected the destinies of Austria and of Europe; its effects on those of Protestantism many of our readers will remember. The Winter-King, as the Germans call Frederick of Bohemia, from the circumstance of his reign not extending over a longer period, is but one of many figures crowding this picture, the merits or demerits of which we do not discuss; it is the subject only that we here allude to, and that is not ill-chosen.

The compatriots of the painter reproach him for suffering the messenger of that fatal news to be adorned and perfumed before approaching the sovereign's presence; and they ask the artist wherefore the more appropriate figure of a soldier, covered with dust and worn with toil, had not rather been chosen, that so the "heart of the mystery" might at once have been laid open to the now half-doubting inquirer, who may justly demand, wherefore, then, are these revelers thus startled from their feasting? This question we leave the painter to settle with his querists; but it is not without a certain pertinence.

Other pictures of similar character were treated by the artists whose works adorned the exhibition in question, and to some of them we may hereafter return; but, for the moment, we refrain from specifying these. Let us rather see if our own history may not furnish us with

* The writer thinks it possible that some mention of Imelda Lambertazzi may be made in Rogers's "Italy," but has not the book at hand to ascertain the truth of this conjecture.

* "Let the toast pass,
Drink to the lass,
I'll warrant she'll find an excuse for the glass."
Song of Charles in "The School for Scandal."

something of approximate, or at least of equally available kind. Our researches will assuredly not be vain. More than one occurrence, well-suited for illustration by the pencil, presents itself to the memory, and shall receive the attention due; but, first, there is a subject of somewhat different sort demanding our care.

Among the many superb halls and galleries devoted to sculpture in the palace of the Vatican, is one called the Nuovo Braccio, erected during the pontificate of Pius VII., and under the immediate superintendence of that pontiff's enlightened minister, the Cardinal Ercole Consalvi. Of priceless worth are the treasures of Art that arrest the steps of him who takes his fortunate way through even this one portion of the vast collection of sculptures assembled in the Vatican, although it is not here that the richest gems in that collection are shined. But we confine our remarks for the present to one only, which, if not the most exalted in conception, is at least one of the most genial in subject and perfect in execution of all contained in the gallery. This is a recumbent statue of more than colossal dimensions, and of imposing, yet most beneficent aspect; excavated from the site of a temple sacred to Isis and Serapis, when the papal chair was occupied by Leo X., and placed by him in the Vatican. This figure, believed to represent the Nile, is in itself a work of infinite majesty and beauty; but the effect of its massive proportions is enhanced by the presence of exquisite children, all clambering and sporting, with the most life-like truth and animation, over and upon the mighty limbs and enormous trunk of the colossus.

Few lovers of Art give their cordial approval to allegory; its far-fetched conceits too frequently perplex rather than gratify the beholder, and it is but the simplest form of this figure that can ever hope to enlist his true sympathies. But in this work we have the simplest form;—we must needs admit it to be an allegory, since the statue is that of a river-god, and the beauteous boys, toiling in all directions to surmount his colossal form, represent the sixteen eubits which are the desired extent of the Nile's annual increase, yet, so slight are the intimations of allegorical allusion, so pure and simply grand is the conception of the work, that you are at liberty to forget the fact that it is allegory, and may resign yourself without interruption to the charming spectacle before you.

The god himself is a figure of rare perfection: the head is crowned with ears of corn, and flowers of the water-lily; a beard of magnificent amplitude flows over the breast, and the face has a most heart-winning expression of benevolence, in the highest sense of that much-abused word.

But the boys! the beautiful children! what a delight are they! you might furnish forth a total gallery by merely copying those life-like groups,—*merely copying*, did I say—now I would that some half-dozen of our artists would set themselves to do it! we might then hope for a collection such as we are else little likely to obtain.

"The boys," you will say, "the boys! let us see what *they* are doing;" and you are right, they amply justify your impatience to look more closely at the animated pictures they are making for us. The grace and beauty of their infantile forms and eager faces, you will imagine; words could do nothing towards describing these. As to their object in life, *that* is to obtain high place on the marble world presented to them by the vast figure of the god. No idle waiters upon fortune are they. It is true that one of them has been led away by the false hope that he may reach the top of the ladder before he has set a prudent foot on the lower rounds, but you see that disappointment awaits him; disdaining to join his companions, who are toiling to get a first step on the mighty foot, *this* man has laid a covetous grasp on the extreme points of the long flowing beard, and seeks to drag himself up by the massive handful which his tiptoe efforts have enabled him to reach. But, no; it is not thus that the head is to be gained—another moment will see him stranded on his back, and

certain of this, you turn to see how the rest are "shaping." Some—legitimate labourers these—have attained, after due effort, to eminent places on different parts of the limbs, and even of the trunk; one among them is amusing himself with the useless toil of a comrade, who is seeking to mount at the knee. The others are strenuously pursuing their upward path.

At the foot is a wee man who cannot make up his mind to try; the effort is too difficult! he is cogitating the matter, with grave looks that sit comically on the baby face of him, but above,—and already making progress up that long and steep ascent, the right leg,—are good friends of his, who look back with encouraging gestures. Wait awhile; he'll begin presently; their good counsel cannot but prevail.

On the mountain of a shoulder sits one who has made his way to that glorious eminence by many a brave effort oftentimes renewed, be you sure of that. So there he sits and takes breath awhile. Another, whose head appears below the neck, and who is in a truly perilous position, has his two arms clasped round a cable-like lock of the river-god's hair; but how, even with that solid holdfast, he is to establish those struggling limbs on the point he is aiming for on the powerful neck, does not yet appear. Fast approaching the enviable occupant of the shoulder is another successful aspirant; he holds a lotus in his hand, and is extending it towards a comrade less advanced, with an expression that says "Keep good heart, man! it is to be done."

But the monarch and glory of that gladsome troop, the observed of all observers, is one who has not only reached the broad table-land of the river-god's head, but has actually stepped thence into the Cornucopia which Nilus holds in his large left arm. Yes, he has seated himself there—even *there*—and the pride of his heart may be well nigh seen to quiver through every beautiful part of his exquisite form. One plump foot pressing firmly on the edge of his well-won eyrie, he sits with head erect, his round arms folded on his baby bosom, while the charming face comes forth from the rich curling locks, thrown back in his triumph, with a frank demand for sympathy in his gladness that no heart of man could resist.

In front of the god is a crocodile, whom one of the children raises his hand to strike, but a second interposing, begs for mercy, and a third tries to urge the creature into motion; two others stand gravely considering what manner of animal the playmate of their comrades may be.

Near the right foot of the statue lies one idle beauty, who does not care to emulate the toils of his brethren, he prefers to sport with the flowers that bloom on the river-god's couch. One might say—"let us hope that he may tak' a thought, an' mend—;" but see! he is doing his best to drag down the good steady man who has won his way to the ankle, which he bestrides with a solemn satisfaction, showing how he hath not accomplished so much without his pains. Surely the fruit of all that labour will not be lost! he cannot suffer himself to be dragged back! let us see what comes of the struggle! No; the sensible plodding fellow has resisted,—he will not hear the voice of the charmer, and another wrench shall free his foot from the tempter's grasp.

And now, to say something respecting the life-like truth and animation of all these groups, would seem due to them, and would be but the barest justice; but nothing short of beholding them for yourselves could give you even a faint idea of their varied perfections;—the joyous alacrity of some, the earnest gravity of others, the perfect *life of motion* exhibited by all, and the charm of grace and beauty pervading every part, all this could not be worthily described in words, wherefore I will not waste your time in the vain attempt.

The base of the statue is adorned with sculptures appropriate to the subject; among them are Barks manned by Pigmies,—celebrated by Pliny for their boldness in chase of the various creatures inhabiting the Nile—and figures of the sacred ibis, with a combat between the crocodile and the hippopotamus. The execution of the whole work is admirable, and if one could ever be tempted to feel dissatisfied with the present

Rome, it would be when thinking of what the glorious city must have been, when *such* were to be seen abounding in all her public ways.

If there *be* a fault in the sweet mother-land,—and when this question is discussed, we are never able cordially to support the affirmative proposition—but if there *be* a fault, it must assuredly be found in that coy reluctance, wherewith alone the blessed sun permits us to behold his comely features, through the larger portion of the year. Grim, grey, and wholly impervious are the veils behind which he, for the most part, conceals the splendours we would so fain be daily worshipping, and for this it is that we *do* sometimes cast looks of regret towards certain of those more favoured regions, whereon his eyes of glory are less unwillingly bent. Nay, are we not sometimes moved to the degree of rushing forth, and of putting between this our well-loved mother, and our shivering selves, that belt of waters wherewith her excellences and her beauties are girdled in from the "broad profane" of the outer world? We are, there is no denying it; but then, it is ever in chase of a gleam of sunshine, nothing less potently attractive could lure us from her side. No, "by him who sleeps in Phylæ," we go for the sun, and the sun alone, nor, could we find it in our heart to expatriate ourselves, once for all,—would it be for aught save the love of his "*beaua* your."

Not that even this would avail to produce the effect. We would make visits to other lands—many and often—but for persistent abode, or even for protracted residence, give us the land of our fathers. England, and no other, is emphatically the place for an Englishman; this is his home, though his tendency to wandering *be* of somewhat frequent recurrence, and granting that his outbreaks do occasionally take him far afield.

For admitting that we bewail ourselves, and break our hearts over the unkindness of Dan Phœbus,—or that we scowl at his obduracy with a visage dark as the sky, through precious weeks and months, while those lazy Palermians, Isehotes, or Calabrese, with many another ragged rogue of our worshipful acquaintance, lie basking in his rays, have we not the sunshine of our hearths to dry our tears withal? and where, in all the world, shall be found a consolation—though your grief *be* of that depth which is justified only by the lack of blue skies—where shall be found a consolation so complete in all its aspects as is the glow of our English fireside!

"The bonny bright blink o' my ain."

We all know the rest, and fair betide the memory of the poet who so cheerily sung and said it. For the love of this, then, let us still hold fast by the land of our birth,—its grim grey skies and all.

And having agreed to do that, why may we not more frequently warm up our galleries by some of those "exquisite reasons" wherewith we are so amply provided as excuse for our determination? Here, for example, is one out of hundreds at this moment presenting themselves in the fair homesteads of England, that must appeal to the hearts of thousands, and if you will but give us their simple history, as you may see it proceeding before your eyes in the goodly halls of a family that need by no means be specified, seeing that its name is Legion in our land, you will merit well of all whose suffrages are worth the asking, and need not go farther from home for your subject this time.

"*Floreat Etona!*" are the words of greeting uttered with beaming countenance, and in the most cheery of tones, by a true Englishman, standing on his own hearthstone, to the right noble-looking heir of his house, whom he has seen to enter their stately portal, but who has been arrested on his way to the magnificent room within which he remains,—and we with him,—by the two sweet sisters hastening down a splendid staircase, also visible from our "post of vantage."

The bright face of the young Etonian, up-turned to meet their glance, gives us fair opportunity for marking the frankness and truth of his brow: the clear intelligence of his eyes, the

force implied in that well-formed chin, with the mingled firmness and sweetness of the mouth, are alike revealed by this attitude, while there is a beautiful expression of heart-warm affection now lightening over all these features, as he replies to the looks of love showering down upon him from those fair heads bending over the massive balustrade; their silky locks half conceal the faces, which are, besides, turned to him, and not for us.

His lithe elastic figure has meanwhile not ceased its forward movement, even now will he elasp those glad sisters in his embrace, and that before they have well gained the lowermost stair.

"Hal has come! he has come!" cries exultingly a much younger boy, who has rushed before him into their father's arms, with the news. Long emancipated from the inglorious dominion of "my sisters' governess," this fine member of our family gathering is the faithful satellite of his brother. He has inherited Hal's pony, since the latter assumed that most envied of thrones, the "Pigskin" (but not as yet the "Pink") on the clever mare always found in so good a place with the Cottesmore hounds last season; and in his secret soul has that urchin vowed to emulate the honours of his senior, through all the wider fields of youthful ambition.

For Hal is the god of his idolatry, and that no finer fellow than he adorns this whole world's round, is the younger brother's most cherished creed. He, too, will join that radiant band of our "*jeunesse dorée*" who disport themselves on the banks of Thames, where the conscious river reflects England's one truly royal hold, the Castle of Windsor. He waits impatiently for the time, and thinks how he, too, among other bold deeds, will then sit down in his saddle, and keep "his horse's head straight,"* as enjoined by a competent authority of the day, whose example effectually illustrates his precept.

The still fair mother of these rejoicing children is crossing the floor with steps that have not lost their lightness, and whose eagerness cannot mar their grace; a more ancient ancestress is rising from her cushions, to throw off half the oppression of her years, as she takes her part in the greetings to ensue. Other accessories there are, but I cannot pause to describe them. Dogs of various races assert their claim to a share in the gladness. And now, if you are not glad for them yourself, the dear people—Etouian, boy-brother, dogs and all—nay, if you cannot see that even the pale governess, stealing down after the two fair girls, and forgetting to restrain the bounding fairy at her side—whose hand she holds but to steady her steps—if you cannot see that even *she* has a beam of welcome for Hal on her face, it is not you who shall paint their picture. Call your comrade, with a heart in his bosom, for this labour of love; you would spoil my heartsome faces for me, and I want them to be set before us with all the warmth of their feelings, no less than with the intelligence of their brows and the beauty of their race.

And a something like *this*—the same in its heart-warming happiness, and differing only in the less or greater luxury of the details and accompaniments—may be witnessed, as every such season comes round, in the dwellings of high and lowly, throughout the length and breadth of our country. Why, then, should we bewail the sun's long absence? Say that he does still keep aloof—and Heaven knows that it is but too true—let us wipe the tears from our eyes, nevertheless. We make sunshine of our own, we English; and when you have painted me these my people, with all the genial glow of your own fervid nature, O painter of my heart, transfused into their good-looking forms and faces, we may defy the world to say that they at least have not well understood the process.

* See Mr. Warburton's "Lyrics of the Chase." His words are those that follow, or nearly so, for verses and title are equally quoted from memory.

— "If your horse is in blooming condition, Well up to the country, and up to your weight, Oh then give the reins to your youthful ambition, Sit down in your saddle, and keep his head straight."

And now, remembering that flogging we got no long time since from our friendly German critic, what say you to looking at our old chronicles; or, if you better like them, at the annals of a later period? But first, let us glance at a morning's work notified by the good Canon, Walter Hemingford, a writer born in the reign succeeding that of the monarch whose doings we are about to commemorate.

If not very edifying, the scene Hemingford describes* has at least the elements of pictorial effect in abundance, and may beside avail to make the fair lady-artist thankful that her lot hath been cast in these later times.

You have, firstly, the third of our Plantagenet kings—even John, of evil memory—employed in what he was pleased to call the distribution of justice, and attended as befits his state. But the business of the morning is peculiar: this is not a criminal court; the prince is merely adjudicating on certain matters between himself and his "wards of the crown;" and it is after this fashion that he settles them:

The lady of rueful countenance whom you see standing immediately before John's seat of justice, is Alice Bertram. She has just been condemned to pay 100 marks—a serious sum in those days—"for not coming to be married to one of the king's vassals at the said king's summons." Unreasonable Alice!

That other dame approaching from the right—a goodly matron, with her children clustered round her—is a certain "Celestia, widow of Richard, the son of Hubert." She hath come to offer those same "marks," and in good number, to the end that "she may have her children in her own ward, and may not be *destrained* to marry, except to her own good liking."

Advancing up the hall, comes Isabel de Bolebec, an orphan damsel, who hopes for the same immunity; but she knows the humour of her sovereign, and promises "three palfreys," in addition to 300 marks, with this proviso: that he "be good lord to her," and release her from the dread of enforced marriage; she meanwhile making engagement to accept no husband without the king's consent. There is an anxious face of a youth peering from behind a group of older men, and gazing at this very Isabel, which looks as if its owner were not without an interest in the result. Heads of horses appear through the distant doorway; are they those of Isabel's proffer?

Nay, 'twere rash to say so, for yonder stands Bartholomew de Muleton, who has bought the guardianship of such lands as Lambert de Yvetoft left, with that of his heir, to say nothing of Lambert's widow, whom he hath leave to marry himself, or give her to any other, as shall best suit him. For this, be sure, Bartholomew must pay well; and the horses may be tribute from *his* stores. Whereof enough: but methinks we have some pithy picturing here, and that not always of the merriest for the Alices and the Isabels concerned; the Bartholomews fared better, as of right: but even for them things did not always remain couched on the rose-leaves so often cited, as we may have future occasion to show.

The life of Henrietta Maria, daughter of Henry IV. of France, and queen of Charles I., was at one period chequered by many a "moving accident," as our readers will all remember. Here is an instance that would furnish a variety of subjects for the painter, and has claim to that distinction which the living canvas bestows, not only as a well-authenticated fact of history, but also as a theme calculated for the exhibition of more than one quality in the artist who shall treat it.

The circumstances are related by Henrietta herself, in a despatch written to her husband, by whom she had been sent to Holland in search of aid against the Parliament. The queen landed in Burlington Bay, after a perilous voyage and narrow escape from Admiral Batten, the Parliamentary leader, who had nearly made her prisoner, despite her Dutch convoy. It is at this moment that the incidents related in the following letter take place.

* See also Madox, "History of the Exchequer."

"BURLINGTON, 25 Feb., 1643.

MY DEAR HEART,—As soon as I landed, I despatched Progers to you; but hearing to-day that he has been taken by the enemy, I send this bearer to give you an account of my arrival, which has been very successful, thank God; for, as rough as the sea was when I first crossed it, it was now as calm, till I came within a few leagues of Newcastle, when the wind changed to north-west, and compelled us to make for Burlington Bay; where, after two days lying in the road, our cavalry arrived. I immediately landed, and later in the morning the rest of the troops came in. God, who protected me at sea, has also done it on land; for this night, four of the Parliament ships came in without our knowledge. . . . These four ships soon began so furious a cannonading, that they made us get out of our beds, at least us women, for the soldiers behaved very resolutely in protecting the boats of ammunition.

"I must now play the Captain Bessus, and speak a little of myself. One of these ships did me the favour to flank my house, which fronted the pier; before I could get out of bed, the balls whistled over me, and you may imagine I did not like the music. Everybody forced me out, the balls beating down our houses. I went on foot some distance from the village, and got shelter in a ditch, like those we have seen about Newmarket; but before I could reach it, the balls snng merrily over our heads, and a sergeant was killed twenty paces from me. Under this shelter we remained two hours, the balls flying over us, and sometimes covering us with earth. At last the Dutch admiral sent to tell the Parliament ships that he would treat them as enemies if they did not give over. This was rather of the latest, but he excused himself on account of the fog. Upon this the Parliament ships went off; and besides, the tide ebbed, and they would soon have been in shoal water.

"As soon as they had withdrawn, I returned to my house, not being willing that they should boast of having driven me away. . . . All this day we have been landing our ammunition. It is said that one of the Parliament captains came before the cannonading to reconnoitre my lodging; and I assure you he had marked it exactly, for he always fired at it. I can say with truth that by land and sea I have been in some danger, but God has preserved me, and I confide in his goodness, that he will not desert me in other things. I protest to you that in this confidence I would face cannon, but I know we must not tempt God. I must now go and eat a morsel, for I have taken nothing to-day but three eggs, and slept very little in the night."

A truly characteristic letter, and one not ill calculated to awaken that interest for his subject without which the labours of the artist are but of poor avail. Several points in this narrative are highly susceptible of pictorial illustration, whether sea or land be the object of the painter's predilection. They do not need minute specification; the simple, yet highly effective relation of the queen is sufficiently graphic, and he who does not perceive her page to be sparkling with not one only, but many pictures, may throw his pencil to the dogs. Nor is the scene of this adventure unworthy to be limned. The beauty of Burlington Bay is acknowledged on all hands; the bold promontory called Flamborough Head, around whose rocky base the wild waves fret themselves into clouds of snowy foam, terminates fittingly its graceful curve; sea-birds, in countless numbers, heighten the animation of the scene, as they wheel about on flashing wing, their softly-tinted plumage glistening through the diamond spray; the hoarse cries they send forth are no inappropriate accompaniment to the hollow reverberation of the deeply-caverned cliffs, which are here of imposing altitude, and are crowned by a snow-white and glittering Pharos, remarkable for the pure elegance of its proportions.

The supremacy over her sister Arts, accorded to Sculpture, by Seneca, Lactantius, and other

* Harleian MSS., 7379.

writers of antiquity, was stontly upheld by the old Florentine, Benedetto Varchi, in the sixteenth century, and has furnished abundant matter for dispute among artists, down to a much more recent period.

For we may not affirm that the votaries of painting held their peace when these questions were in agitation. All will remember the fluency—if we are not to say the force—where-with Vasari maintains the excellence of his own beloved Art; and few will forget the picture ingeniously painted by Giorgione, to prove that painting could represent the object on every side at one view, no less effectually than sculpture.* Later still, the lively Frenchman, Danton, retorts on the sculptor Falconet, who was boasting the universal capabilities of his Art, in the following words: "Pais-nous donc un clair-de-lune avec ta sculpture;"† but on this the accurate Stirling remarks that Vasari had previously cited "*il luer della luna*," as one of those subjects which are beyond the power of the sculptor to imitate.

Don Felipe de Castro, "*primer escultor de Camara de Su Majestad*," the king of Spain, in the middle of the last century, upheld the part of sculpture in that country against Pacheco and the painters, and—as we find in the admirable author cited above—he translated the work of Vasari into his native Castilian, for the benefit of such as could not read it in the original. How much or how little this would contribute to convert Pacheco and his followers, the reader will judge. In a note to this passage, Stirling has the following: "The final problem with which he (Vasari) poses the sculptor is, to represent a clown blowing his porridge, and to represent the breath of the one and the steam of the other."‡ At a word, there has been no lack of disputants on either side; but we are not now disturbed by these profitless discussions. Each resplendent sister has long since taken her glorious place in the world's estimation, well content, and justly so, with that appointed her. No painter now racks his brain for the means of presenting all the sides of his picture at one view, and on the same canvas; nor does any sculptor feel aggrieved by the declaration that he cannot show the steam as it rises to the nose of the man who eats his porridge.

There is no longer any reluctance on the part of the sculptor to admit that his fields of range are less extensive, or, at the least, less varied in their character, than are those of the painter; and this acknowledged, the former is all the more unwilling to leave unappropriated any part of that domain which is more particularly his own. How then does it happen that we so rarely find him occupied with a subject that, more than all others, might be supposed likely to appeal to his sympathies? We mean that most spiritual of the Camæne, the Nymph Egeria. Even in the mother-city of Art, great and beloved; even in Rome, the guiding genius of Numa hath not yet had "all her praise;" nor by the sacred haunts of that Fountain, well-nigh within your ken as you leave the city, though duly honoured by Livy and Plutarch, do you see the temples you so naturally hope to find in a region so highly honoured. Again, by that other Fount of Aricia, beloved of Art for its own fair beauty, no less than for the memory it holds of fervid praise, as breathed from the lips of Silius Italicus, nay, as uttered by Virgil himself, the fanes you look for are not yet consecrated to this most legitimate object for the worship of Art.

That no early statue of Egeria has been found, is, without doubt, one cause of the want we deplore; for too frequently has the artist of all ages condescended to reproduce the idea already familiar, when he should rather have enriched his Art with some offering, the result of his own genius. But this circumstance is amply accounted for by that law, promulgated by Numa Pompilius, whereby all representation of the gods by human forms was forbidden; and so rigid was this prohibition, that nearly 200 years

had elapsed from the death of the legislator, before any statue of the gods had been placed in a Roman temple. Those found in Rome at a later period were the work of Etruscan artists. Thus the sculptor has had few models for his imitation, as regards this fertile subject. For the fact that he has not more frequently trusted to his inspiration, we have already expressed our regret, and will not now recur to it. The absence of ancient works on this theme is then not surprising, however much to be lamented; but that so few statues of Egeria have been attempted in modern times is less easily accounted for. That the mutilated figure, lying in the fountain, at that part of the Roman Campagna which Italians now call the Caffarella, but which is perhaps better known to English travellers as the Fountain of Egeria, is no statue of the nymph, none who have seen it will require to be assured—it is, in fact, not the figure of a female at all.

The few statues representing Egeria with regal attributes, and making her the personification of peaceful rule, as opposed to lawless anarchy—that, for example, by René Frémin, a pupil of Girardon's—do but poorly express the many attributes attaching themselves inseparably, and as her undoubted appanage, to that image we all hold in our hearts, of the exquisite Camæna.* Wisdom in its perfection, and therefore Goodness in its highest manifestations, as well as in its most attractive form; these are at once presented to our thoughts, and demand our willing reverence, as we think of Egeria. For what are we to understand by the influence of the Nymph, if it be not that this constituted the whole sum of those virtues whereby Numa was enabled to elevate his people, and thus to render them happy?

By no effort of human genius could all the lofty ideas connected with the image of Egeria be worthily represented in the external sense.—But among her attributes is one by which she is brought well within the limits of human sympathies. This is that sublimated affection, far raised above all taint of earth, which forms a distinctive peculiarity of the Camæna's character, and is perhaps inferior to none in its beneficial action on the destinies of mankind. He, then, who shall exhibit Egeria in this one phase of her ethereal being, will assuredly place the beholder in such a presence, as must be worthy of admission to, and deep worship in, the purest of Art's shrines.

Now would that Thou hadst lived to make this worthiest of themes thine own—ah, too early lost!—but no, let us not bewail the departed; let us rather wait in hope for the advent of that Master whose soul the deep-veiled Future is preparing for this work.

Look to it, then, ye who aspire to the high name of Sculptor, believe not lightly in the whisperings of self-love,—yet let him whose brow is indeed destined for the laurel, not forget that "Be bold! be bold!" was an injunction that preceded the "Be not too bold!" Few among you need reminding of the latter precept, none know better than yourselves that true modesty ever accompanies true merit—that the counterfeit of either is soon detected. But for success in this emprise, there is more than mere boldness, and more than ordinary merit required—let him who shall undertake it, see that his inspiration be derived from no source unworthy of his theme, let him approach his exalted task, then only when the robe of Art's most solemn priesthood may be assumed without peril of desecration; thus alone can he hope to see breathing from his marble, some faint perception of the true Egeria—perfect Wisdom, that is, and therefore Goodness in its highest manifestation.

On the brow of the nymph there is the inspiration of the Sibyl—as of right—but, even yet more effectually appealing to our sympathies, there is also Love—the deep love of the Seraph†

—which beams from every feature of her faultless face—for the divinity of Egeria was in that Love. The sweetness of the perfect mouth has no touch of earth, and to the delicate cheek, the artist—himself inspired—whose soul shall be transfused by this dream of beauty, will feel constrained to impart a refinement, unknown to the mere ideal of physical perfection in form as applied to the grosser Olympian deities; while the softness of the chin shall have a firmness withal, truly declaring the power of the Camæna for enduring. Yes, Egeria might have borne aught save the departure of the beloved—beneath that infliction her divine spirit sank, and was dissolved.

Many and beautiful are the phases of her exquisite existence, that must at once arise to the mind and memory of the artist—but say that he attempts to render his idea of Egeria listening to the step of the approaching monarch—his footfall has sounded on her ear, and the blessedness of an ineffable content is in her heart; no eagerness disturbs the calm of her more than regal beauty, the finely moulded head is slightly raised and thrown back, while the richly rounded yet flexible figure exhibits that grace which is inseparable from our idea of the Nymph Egeria, and is indeed the unfailing result of a beauty whose fount is in purity of heart, and elevation of soul.

This, then, is Egeria's moment of happiness; but how sad the contrast that awaits her!

For let us suppose that the artist—sculptor or painter—who shall have given his heart's best love to this pearl of an old mythology—and let none other presume to approach it—let us suppose that he has proceeded to shadow forth the idol of his reveries as advanced into the next mournful period of her life on earth. The gods have reclaimed their own, Pompilius has departed, and the haunts of the Camæna are left desolate. She has sought forgetfulness in the forests of Aricia—once, says Silius Italicus, her favoured abode—but the wood-nymphs seek in vain to assuage her grief; they have gathered mournfully around her, their graceful groups scarcely less worthy of the sculptor's art than is the form of the sorrowing Egeria herself.

Hippolytus has joined his efforts to those of the Dryads; the hero, devoutly worshipped in Arician forests, has forsaken his shrines to offer consolation to the bereaved. But, like the wood-nymphs, he has failed—her suffering has no truce, and "the worship of the great Goddess Diana is interrupted by her plaints, which do not cease."

Hippolytus departs, as do the wood-nymphs, and Egeria is left to her sorrows; left by all save the Art-devoted, who is wholly her own. He returns, as to the lodestar of his life. The Camæna has not found consolation, but even as he gazes, there comes a change. From the most retired depths of her sacred groves the compassionate Artemis approaches—he beholds her advancing, and kneels, awe-struck; Egeria, too, has perceived the goddess, the Camæna feels that her deliverance draws near, her drooping head is once more raised; a brightness, as of more than mortal beatitude, succeeds to the superhuman sorrow by which that beauteous head was bowed: the pitying Diana will complete her work, and Egeria shall cease to grieve, as her form dissolves into that Fountain whose purity shall ever remind the beholder of her own.

And now, seeing this, shall not the Artist—painter or sculptor—once again betake him to the pencil or the chisel, insufficient though he find them to the perfect realisation of those high thoughts suggested to him by his immortal Art! Let him not fail therein! and if he bring not forth in all its radiance that divine creation which hath made glorious his dreams, he shall at least produce a presence, fair beyond aught that our more earthly perceptions had power to imagine of pure and beautiful.*

[The author is not aware that this subject is now being treated by one of the most accomplished sculptors of the age—Mr. J. H. Foley, A.R.A. He selected it for "the commission" he received from the Corporation of London.—Ed. A.-J.]

* See Vasari, "Life of Giorgione."

† See "Annals of the Artists of Spain," vol. iii, p. 1237, *et seq.*

‡ Stirling, *ut supra*, vol. iii, p. 1233.

* It may, perhaps, not be unnecessary to remind the reader that the Camæna are of a higher order than the Nymphs generally, since they add to the attributes of the latter the Sibylline distinction of prophecy, and are endowed with knowledge of all the future.

† The reader will remember that, in the hierarchy of angels, the seraph is the spirit of love, as the cherubim are the spirits of knowledge.

* To be continued.

BRITISH ARTISTS: THEIR STYLE AND CHARACTER.

WITH ENGRAVED ILLUSTRATIONS.

No. XII.—JAMES CLARKE HOOK, A.R.A.

VERY artist who has reached a high position becomes, from the very elevation to which he has raised himself, public property, so to speak: that is, the public whose favourable suffrages he has won by his works, feel also an interest in the individual who created them: they desire—and the desire is legitimate and perfectly reasonable—to learn something of his life and history as associated with his works, to know when and how the spirit which has exalted him above the multitude and linked his name with the great ones of the earth first developed itself, and how it was fostered and grew to maturity. Such a

man can no more expect to escape observation—and mark, it is not the eye of impertinent curiosity that seeks him out, and that would penetrate even the solitude of his studio, and, to a certain extent, even to the sanctity of his domestic hearth—than a great legislator, or a renowned warrior, or a successful author, or any other who soars above the range of common men. It is the penalty, if it be so considered, each pays for his position and popularity: the man himself may be indifferent to the praises or the censures of his biographer; nay, it may be most distasteful to him to find his history “chronicled in a book,” though he cannot be regardless of the fame which attaches to his deeds; but as the history is the inevitable result of the reputation, he must make up his mind that when he has himself achieved the one, sooner or later somebody will effect the other for him.

It is at all times a delicate task to write of the living, but especially of those whose mental constitutions and almost monastic seclusion from the active business of life cause them to be peculiarly sensitive to the remarks of the critic and the biographer. Politicians, and all those numerous

classes of men who voluntarily engage in the din and clamour of public affairs of every kind, expect to have their sayings and doings canvassed in and beyond the sphere of their operations; they lay their account to the misrepresentations and hard blows of their opponents as evils from which it is impossible to escape; and inasmuch as they are selfimmolating victims on the altar of public opinion, and the shafts hurled against them by hostile hands are generally only the weapons of party spirit, and are directed against their public actions alone, whatever result follows is one comparatively easy of endurance, and is forgotten in the excitement of new political or speculative movement. But artists, as a body of men, are cast in a different mould; the nature of their occupation, thoughtful, silent, sedentary, tends to promote that peculiarity of feeling which seems to be an inherent portion of their existence; nor does it forsake them even when they have reached a point of distinction where the harsh judgment of the critic is powerless to turn popular favour into other channels. Some, indeed, like Barry and Haydon, are made of sterner stuff, and care little for what foe or friend may say or write, almost as indifferent to the praises of the one—unless in precise accordance with their own views—as to the censures of the other, which are generally ascribed to ignorance, and frequently this is not far from the truth. It becomes then, as we before remarked, a delicate task which we have undertaken to perform: our labour has, however, been greatly lessened by the information as to facts, courteously given us by those of whom we have written; nor have we felt much solicitude when speaking of their works, for these already have passed the ordeal of public criticism and received a favourable verdict. Our subjects have been good, we have endeavoured to do them justice; whatever of failure there is, is our own, and while freely acknowledging the inadequacy of the performance, we must also profess that our aim has been, and is, to extend a knowledge of the British School of Artists—in their lives and their works—wherever the influence of the *Art-Journal* prevails; and to do this with a right appreciation of the artist's feelings, so as to invite his co-operation rather than drive him to a distance from us, to cheer him with the kindly accents of a friend, but not to insult him with “the deceitful tongue of the flatterer.”

The father of Mr. Hook held an important government post on the coast of Africa, where, we believe, he died: his grandfather on the maternal side was Dr. Adam Clarke, the distinguished biblical commentator. Mr. Hook entered the schools of the Royal Academy at an early age, and gave proofs of his industry and ability by gaining, in 1843, for

MARKET MORNING.

[J. W. Whymper.

the best copy in the School of Painting, the silver medal, with the Lectures of the Professors Barry, Opie, and Fuseli, and the silver medal for the best drawing from the living model. In 1846 he had awarded to him the gold medal of the Academy, with the Discourses of the Presidents Reynolds and West, for the best historical painting in oil of “The Finding of the Body of Harold:” of this picture we published at the time the following remark;—“We cannot speak too highly of it; it is in

all respects a work of great promise, that will place the artist high in the list of fame.” We are accustomed to hear outcries and complaints against the Academy as an institution effecting little or nothing for the good of Art: now, admitting that, in comparison with many of the continental schools, it does not offer such advantages as the country has a right to look for, and also that there is much in it requiring a radical change, it cannot be denied that the majority of our best artists have been educated

in its schools, and stimulated to exertion by the rewards and encouragements it holds out to the young student, while there is not an artist in the kingdom who is not emulous of being associated with its members, not because the privilege necessarily stamps the possessor as one among our greatest artists, but because he is presumed to be, by those who are looked upon as the best judges and whose opinion carries weight with the public, worthy of the distinction; and thus the painter, if a good one, and conscious of his own deserts—for few men are blind to their own merits or demerits—feels that his talents are recognised by his professional brethren; if a bad one, the cabalistic letters "R.A." after his name give him a position he would never attain without them, and are at least a sign of presumptive excellence, and bear a proportionate value.

The first work exhibited by Mr. Hook must have been while he was yet a young student in the schools of the Academy, or prior to his entering, for we find in the Catalogue of the Exhibition for 1839 his name appended to a picture entitled "The Hard Task;" in 1842, the year before he gained the silver medals, he exhibited a portrait of a youth, and in 1844 an incident from Boccaccio, "Pamphilus relating his Story." In the following year he sent to the British Institution "Four Subjects from Rogers's Poem of 'The Wish,'" which elicited laudatory notice in the *Art-Journal*; and to the Academy a "Portrait of a Gentleman," of which we spoke as showing "considerable merit," though deficient in colour, a fault which none will lay to his works at the present time; and a picture of higher pretensions than any he had yet produced, "The Song of the Olden Time," which called forth the following observations from us:—"This work is not unworthy of 'the line' in the great room. The portraiture of the aged knight is perhaps objectionable, as too obviously 'a study,' but the young and happy pair whose joy he is contemplating, form a picture of exceeding and touching beauty: it is capitally painted, as well as excellently composed." In 1846, the year wherein the gold medal was awarded to him, he exhibited another picture of good promise, "The Controversy between Lady Jane Grey and Father Feckenham, who was sent to her from Queen Mary, two days before her death, to try to convert her to Romanism:" it was unfortunately so ill-placed—in the room usually assigned to architectural subjects—that it was impossible to judge of its real worth.

Stimulated no doubt by his success in the competition for the gold medal, Mr. Hook essayed in 1847 a work of a higher order than any he had yet attempted, for it will scarcely be denied that subjects from sacred history, however much they approximate in character to the ordinary incidents of life, require a more elevated style of treatment than any other class of subject. We can never dissociate from the mind the idea that the commonest event, if such a term may be employed when referring to biblical history, which is therein recorded, is separated by a wide line of demarcation from what may occur among ourselves; and it can only be truly represented by the art of the painter when he feels that he

is illustrating a passage of sacred history; it must be treated religiously no less than artistically. "Rispah watching the dead Sons of Saul," contributed by Mr. Hook to the British Institution, is a difficult subject for a young painter to grapple with; Mr. Hook evidently found it so, but the work displays considerable skill in the disposition and foreshortening of the lifeless figures, and a knowledge of colouring in the distinction between the flesh-tints of the dead and those of the living. His contribution to the Royal Academy this year,—"Bassanio commenting on the Caskets," from the "Merchant of Venice,"—like that of the preceding year, was hung where it could not be examined properly; we saw sufficient, however, to satisfy us it ought not to have been in the position it occupied. His solitary picture of 1848 was a composition of numerous

figures, taken from "The Chronicles of Giovanni Villani," a scene in ancient Florence, when the Emperor Otho IV. visited the city; the work, notwithstanding the care that had evidently been bestowed upon it, did not favourably impress us; there is an air of stiffness about the whole composition that mars its good qualities.

In 1849 Mr. Hook commenced the series of subjects, for we scarcely can include his picture of 1847 among the number, from Venetian history, real and fabled, with which his name is now closely identified: he sent to the British Institution a painting entitled "Venice—1550," illustrating a presumed period in the annals of the republic, when, as the poet says, the nobles

"Did please to play the thieves for wives."

The picture represents an extensive hall which opens on one of the canals intersecting the city; at the farther end of the hall is seated a man in the prime of life, and in the nearer part of the composition is a girl whom a youth, who has just stepped out of a gondola, is addressing in a manner that sufficiently indicates his purpose, which is to elope with him; the picture is painted with very considerable power, both as regards colour and expression. In the Royal Academy exhibition of the same year he had three pictures: "The Chevalier Bayard wounded at Brescia," a graceful composition, in which the knight, "*sans peur et sans reproche*," is tended on his couch by two ladies; the painting is remarkably rich in colour and refined in character: "Othello's

A DREAM OF ANCIENT VENICE.

[J. W. Whymper.

first Suspicion" is expressively illustrated, particularly in the rendering of the gentle Desdemona: "Bianca Capello," from Rogers's "Italy," is, as a subject, somewhat similar to the picture in the British Institution just referred to; those who have read the poem—and who, having the opportunity, has not read and admired one of the most graceful poems of modern authorship!—must well know the story, which the artist has illustrated in a kindred spirit of warm but saddening feeling.

To the British Institution, in 1850, Mr. Hook sent "The Chevalier Bayard departing from Brescia," a companion picture to that exhibited in the Academy the preceding year: the Chevalier is now restored to health, and is preparing to go forth once more in the pursuit of new honours; his groom is buckling on his spurs, and the ladies to whom he is so

greatly indebted for their careful nursing, present him at parting with *souvenirs* of their companionship during the days of sickness and suffering; we have always considered this picture one of the most charming works of the artist. The history of Francesco Novello di Carrara afforded Mr. Hook a theme for one of his two pictures exhibited this year at the Academy: Carrara and his wife, the Lady Taddea, have concealed themselves in a thicket to elude the emissaries of their enemy, Galeazzo Visconti: the horror of the fugitives at the proximity of their pursuers is very forcibly expressed. The other picture, "A DREAM OF VENICE," forms one of our illustrations, it needs therefore no description; the original is brilliantly painted. In the autumn of this year Mr. Hook was elected an Associate of the Academy.

"The Rescue of the Brides of Venice," exhibited in the Academy in 1851, was among the chief attractions of the annual collection: the ladies have been captured by pirates, who are surprised at Caorli, while dividing their spoil, by the young nobles of Venice and their retainers: there is a sharp conflict going on in boats; the great object of the rescuers, next to

the liberation of the captives, is to protect them from the dangers of the encounter. The scene is full of excitement; the grouping of the figures is good, the general design most artistic, and it is carried out in all its details with vigour and great ability. His second picture of this year, "The Defeat of Shylock," is the "pound of flesh" scene from "Othello;" the characters that are here brought into view are presented with a just discrimination of the dramatist's personations.

We extract from the notice of the exhibition of the British Institution, which appeared in the *Art-Journal* of 1852, the following remarks upon a small painting exhibited by Mr. Hook, "Olivia and Viola":—"The picture is remarkable for brilliancy of colour and softness of execution. The high intellectual power of the artist may have been better seen in more ambitious works, but there is exquisite feeling in this." His contributions to the Royal Academy this year, "Othello's description of Desdemona," and a subject from Boccaccio, "The Story of Signor Torello," scarcely sustained the well-earned reputation of the painter, and we took the liberty of advising him to forget Italy for awhile, that he might here-

TIME OF THE PERSECUTION OF THE REFORMERS IN PARIS.

[J. W. Whymper.

after return to her with newer conceptions;—advice, however, which was only accepted in part, for we find him exhibiting the next year in Trafalgar Square another incident in the history of the Chevalier Bayard, representing him conferring the honour of knighthood on the infant son of the Duke of Bourbon, when visiting this prince, on a journey through Moulins; there are five figures in this picture, the Chevalier—who wears a full suit of plate armour—the Duke and Duchess, the infant and his nurse: the subject of the picture would scarcely declare itself, were it not for the title; not, however, from any defect in the composition, but because the historical incident is singular: the conception of the work is good, and it is carried out in the usual vigorous style of the artist. A story from Spanish history was made the subject of Mr. Hook's second picture this year, "Queen Isabella and her Daughters in the Interior of a Nunnery, engaged in Needlework with the Inmates of the Institution," a practice which Mr. Prescott, the historian of the reign of Ferdinand and Isabella, says the Queen adopted throughout her kingdom: the incident is illustrated very charmingly.

In 1854, however, Mr. Hook entirely lost sight of Venice, her brides,

her cavaliers, her gondolas, the water-gates of her palaces, and her dingy canals, and found something to suit his pencil in the hedgerows and corn-fields of old England. We always like to see a painter of acknowledged ability and genius turning his thoughts into a new channel, especially when, as in this case, the diversion is favourable to the artist: the world is often apt to think—and generally the suspicion is well founded—that his powers cannot reach beyond a certain line of characters, in dramatic phraseology; we believe the chief reason why artists so rarely attempt novelties is that they are content to wear the laurels gained in one service, united with the apprehension that a failure in another would involve the partial loss of those they have already won. Possibly, too, they may entertain feelings similar to those which, we believe, most actors possess, who would greatly prefer to play the same character over and over again, to undergo the labour and study of a new one. Of the three pictures exhibited by Mr. Hook in 1854, the first, entitled "A Rest by the Wayside," represented a group of noble trees, thickly clustering shrubs, and verdant herbage, the former serving to shelter a gipsy woman and her child resting under their shadow: the foliage is pencilled with truth and delicacy;

we scarcely remember to have seen a better piece of landscape-painting by a professed historical painter. The second, with a rather ambiguous title, "A few minutes to wait before Twelve o'clock," represents a corn-field in which reapers are at work; the wife of one of them, with her young child, has brought the labourer his dinner, and is waiting the noontide hour allotted to the repast: it is a pleasing composition, naturally and poetically treated. The third owes its origin to the history of the Huguenots; it is called "TIME OF THE PERSECUTION OF THE CHRISTIAN REFORMERS IN PARIS;" it forms one of our illustrations: this picture is, without doubt, one of the artist's best productions. It represents a Protestant family passing the image of the Virgin in the public

streets without paying it the homage which the Catholics required of the passers, by uncovering the head: a zealous soldier "unbonnets" the recusant with his lance, as no Catholic would pollute his fingers by contact with anything worn by a heretic: the priest is directing the attention of the chief of the family to the figure which he has passed unnoticed: the earnest look of the wife, and the horror of the young boy, are points in the composition which the painter has rendered very expressively.

It remains for us only briefly to notice Mr. Hook's exhibited pictures of the last year; his contributions to the Academy were more numerous than on any preceding occasion, five in number:—"MARKET MORNING," a bit of genuine English scenery, exquisitely wrought out;—"A Frac-

Engraved by]

THE FIRST WHISPER.

[J. W. Whymper.

ture," a portrait of a little urchin mourning over his broken plaything;—"A Landscape," but whether from nature or fancy we know not, yet there is abundance of nature on the canvas;—"The Birthplace of the Streamlet," nature again;—and "The Gratitude of the Mother of Moses for the Safety of her Child." With the exception of the last, it will be seen that all these subjects are of home growth, and they show that Mr. Hook's pencil delineates the scenery of his country as gracefully and as powerfully as it revivifies the romantic histories of "The Bride of the Adriatic." None, we are certain, however much and deservedly they appreciate the artist's Italian subjects, will regret the change that has recently come over him: still we shall welcome an occasional introduction to those scenes which first brought his name into prominence, and

to which he is indebted for the position he has reached. While speaking of subjects for painters, it may not be amiss to draw the attention of our artist readers to the series of papers on this matter with which we commenced the new year: no one will pretend to say that British Art has drawn so largely upon British history, the drama, poetry, and the writings of the novelist, as entirely to have exhausted them; yet something which the public has not been accustomed to see almost year after year would be most acceptable; and there are some admirable subjects for the artist, described in the articles which the pages of our Journal have furnished, and will continue to furnish from time to time.

The picture of "THE FIRST WHISPER" is from an early picture by the artist; a simple yet elegant composition, rich and harmonious in colour.

ANCIENT ARMOUR.*

ARCHAEOLOGY, as a branch of study conducive to the proper knowledge of past history, has received an amount of respectful attention of late years by no means accorded to it in times past; this has resulted chiefly from the labours of a few men, who, instead of confining themselves to the pettiness of collecting curiosities, and desecrating on topics of small importance, have taken a broader and truer view of their mission, and have assisted us to the fuller comprehension of the habits and customs of our forefathers; giving strength to the narrative of the historian, by bringing forth silent witnesses to his truthfulness, from the grave of the Saxon, or the Norman battle-field. By a careful comparison of written evidence, with actual discoveries of all kinds, and an examination of museums, public and private, an enormous mass of information of the greatest possible value has been obtained from out-of-the-way sources. This has, however, been the result of very many years' patient labour, and the credit of it by no means belongs to the present generation. The slow accumula-

SAXON WARRIORS.

tion of facts, the careful examination of conflicting evidence, the clear elimination of data from the whole course of study pursued, have been gradually appearing for the last fifty years; and even now the result is in some instances open to doubts, and wanting in proofs more conclusive. Many of our early authors whose minds were decided on certain points, may now be proved in the wrong; but we must ever remember that we start with the possession of all the knowledge they gathered, and have therefore a vantage-ground given to us by them, which should always be gratefully remembered even when we may feel obliged to note their mistakes.

The study of ancient armour has never been very popular in England, and we doubt whether it ever will be. Many reasons may be given for this, but probably the best one is the entire absence of military experience in the people, as contrasted with that forced military education so common to other nations. The collecting

* ANCIENT ARMOUR AND WEAPONS IN EUROPE. From the Iron Period of the Northern Nations to the end of the Thirteenth Century. With Illustrations from Contemporary Monuments. By JOHN HEWITT. PARKER, Oxford and London.

of specimens of ancient armour is equally unpopular, but may more readily be accounted for in the difficulty of devoting space and care to its preservation, as well as the heavy expenses of the taste. With the exception of Sir Samuel Meyrick's there was no collection a few years ago but that in the Tower of London.

It is due to the memory of Sir Samuel to acknowledge him as the true originator of what taste and knowledge do exist amongst us: it was to his indefatigable exertions that our national collection was put in proper order; he also amassed a more extraordinary private collection at his seat, Goodrich Court, in Here-

GREAT SEAL OF WILLIAM THE CONQUEROR.

fordshire, while the volumes published by him and Skelton, illustrative of that collection and the history of armour in general, are among the most important contributions of literature to this branch of knowledge. Many errors there may be in these works, and a few conclusions too hastily formed; but to value them fully we must

remember how little there was before that time for guidance, and how much these books have left for posterity to repose more safely upon. The large mass of transactions of antiquarian societies at Somerset House and elsewhere, have greatly helped in elucidating minor facts, and the continued researches all over the kingdom gradually

GREAT SEAL OF RICHARD I.

elicited a large mass of evidence for the patient modern investigator.

Mr. Hewitt appears from his quotations to have industriously waded through all this; and to him the credit is undoubtedly due of bringing together, in one portable volume, an enormous quantity of scattered facts of the greatest utility

to the student of ancient armour. His book is the cheapest and most portable general treatise hitherto published; and it is illustrated by many neatly-executed wood-engravings, of which our present pages furnish examples. The earliest we select is a group of Saxons copied from a MS. of Prudentius, in the Tenison Library, believed to

have been executed in the eleventh century; the spear, sword, shield, and helmet, seem to have been the soldier's chief defence; body armour first appears as a leather coat, and upon that rings of metal were sewn, (as seen in the figures of our warrior sovereigns, in their two great seals;) which, however, appears to have been appropriated to the chiefs of the battle. Thus originated the chain mail of the middle ages, which varied from it in the important point of consisting entirely of linked rings, making it in fact an iron pliable garment. The notices our author gives of the importance attached to these defences are curious: thus it was enacted by Henry II., that "whosoever held a knight's fee should have a coat-of-fence, a helmet, a shield, and a lance; and every knight as many coats, helmets, shields and lances, as he shall have knight's fees in his domain," and every "free layman having in rent or chattels the value of sixteen marks," is to make provision like the man who may be worth a knight's fee. "But no Jew shall have in his custody any coat of mail," for he

KNIGHT'S EFFIGY, HASELER, GERM.

must sell or give it for the king's use. Isaac of York might, therefore, value Ivanhoo for the protection he could afford his house. The miserably restricted policy of feudal times peeps continually forth in the pages of the historian; and its general tyranny nowhere appears greater than in books devoted to the so-called "glorious" art of war. The arbitrary enactments for enforced military service are continual; but the power and endurance of the common soldiery in the middle ages was most remarkable; and we hear of knightly legs, severed through the armour by the strong axe of the foot-soldier, and falling on one side the horse, while its unlucky owner dropped on the other; or of bowmen who "shot a good shaft" so powerfully as to penetrate an oaken gate "four fingers thick." The hardy half-wild character of these sons of Mars, often gave them an advantage over the mail-clad horsemen, who kept adding continually to their cumbrous defences, until the sixteenth century saw them as completely enclosed in solid plate-armour, as is a lobster in his shell. The

researches of our author do not, however, at present carry his history so far; his latest examples belong to the thirteenth century. Of the

character of knightly defence then used, the engravings on this page will furnish specimens; the first selected from one of those valuable

MOUNTED ARCHER OF THE THIRTEENTH CENTURY.

monumental effigies so common in England, and so rare elsewhere; the second from an illuminated manuscript of the close of the thirteenth century (Royal MS. 20. D. 1), which also displays

the housings of the horse decorated with the arms of its master; the third from a glass painting in the window of the north transept of Oxford Cathedral, representing the murder of St.

THE MURDER OF BECKET.

Thomas-a-Becket. The knights are armed in suits of banded mail, with knee-pieces of plate, their shields are richly adorned with diaper-

work; the foremost knight, the famed Fitz-Urse, has three bears'-heads on his, allusive to his name and family coat.

In going over so large and difficult a field of investigation, we feel that Mr. Hewitt has acted diligently and well; we think, however, he has trusted too much occasionally to the opinions of a few foreign antiquaries, such as Worsaae, who would deduce every thing from the original usages of their own countrymen. We also cannot "be at once convinced," that the famed Bayeux tapestry was "not wrought by courtly ladies, but by the ruder hands of the tapestry-workers;" we should, in fact, come to a totally different conclusion, by the same "careful examination" our author speaks of. But these minor points are of small consequence where so much has been done; and we rejoice to find Mr. Hewitt a strenuous advocate, as we have ever been, of the folly and mischief of modern restorations of old monuments, like that of the knightly effigy on the preceding page. He assures us, and truly, that "they have been patched up with Roman cement, eked out with supplementary limbs, plastered over with mock Purbeck marble. The mistakes that have been committed in costume, equipment, and art-treatment, are more fit for the pages of a jest-book, than those of a sober treatise; and it is scarcely necessary to say, that for any purpose of the historian, the archaeologist, or even in the more narrow view of ancestral portraiture, the statue has become, under such a treatment, utterly valueless." With this sensible quotation, we close our notice of a book, which has certainly added much to our knowledge on an abstruse and difficult study.

ART-STUDIO AT BIRMINGHAM.

SOME time ago we informed our readers that an enterprising and liberal gentleman of Birmingham, Mr. Underwood, was about to establish an institution there, with a view to the propagation of Art by lectures, a library, &c. &c.

It is now formed, and during the past month was opened by an inaugural address, delivered by W. C. Aitken, Esq., who has on many previous occasions been eminently useful in the work, with the best interests of which he is closely associated.

The Lecturer commenced by remarking that the Studio had been founded by the liberality and public spirit of a private individual (Mr. Underwood), who, animated by a desire to help forward the cause of Art-education, had provided the numerous casts, pictures, drawings, and other works of Art which adorned the room, together with a selection of very costly books for the use of the students. The proper use of these means would materially aid in elevating public taste and promoting the appreciation of the beautiful, and would tend to civilise, humanise, and refine the community generally, as well as intending artists and Art-workmen, by placing before them the necessary appliances for the attainment of that desirable object, an acquisition of the principles of Art. It was not intended in establishing the Art-Studio to trench upon the province of teachers of drawing, or to interfere with any existing institutions. The object was rather to foster an improved taste, by affording to students the means of perfecting themselves in the higher branches of Art. The love of the beautiful was implanted in our nature for the noblest purposes, and the cultivation of this God-given sentiment was a duty imperative on all. Quoting a passage from Milton's "Paradise Lost" in support of his argument, the Lecturer pointed out that not one of the talents given to man was intended to lie dormant—far less those faculties that stimulated the moral sentiments through the medium of the visual organs. The most perfect mode of education was through the medium of the eye: the nations of old, in attempting to give expression to ideas, instinctively adopted picture-writing, or painting, as the means of doing so. Thus, by the touch of the painter, the sentiments of piety, admiration, and friendship had been beautifully expressed to succeeding ages. The works of the Egyptians and Greeks, for instance, still excited admiration and awe. Glancing at the works of the Greek sculptors and painters, Mr. Aitken remarked on the eagerness manifested in that remote age to possess high-class works of Art, citing as an example the circumstance that one of the sieges of Rhodes was undertaken to obtain a picture by Apelles which was kept in that city. He proceeded to remark that if the relics of these productions even now excited wonder, what must have been their effect when they were unutilised? With a climate

suitable for the display and preservation of works of Art, the Greeks attained a degree of excellence never surpassed; and although their genius had departed, its ancient influence would be felt to the remotest times; works such as the Medicean Venus and the Apollo Belvedere stood out in bold relief as records of a people great in arms, in art, and in song. The Lecturer then reviewed the development of Italian Art, through the works of Cimabue, Giotto, and their contemporaries and successors, until it arrived at the culminating point in Raphael, Michael Angelo, and Leonardo da Vinci. In the course of his argument, Mr. Aitken carefully pointed out the transition of the Italian Art from the religious to the sensuous phase, and illustrated the change by engravings from pictures produced in either manner. Passing on to modern Art, he observed that the French school, until recently, had not produced any artists who were entitled to be called great masters, notwithstanding royal patronage and munificence had been extended to men of all nations, from the time of Francis I. down to the reign of Louis Philippe and Napoleon III. He referred to the late Paris Fine Art Exhibition in proof of the progress made by France, and alluded also to the modern schools of Continental Art as there developed. The modern German School was distinguished by the great works executed in fresco, in all probability arising out of the state patronage and the adaptability of the public buildings of that country for artistic purposes. Cornelius Kaulbach and Overbeck were the leading masters. He then directed attention to the state of Art in England. Doleful complaints had been made of our inferiority as practical artists or theoretic judges of Art. And this was not to be wondered at, for the artist had not until of late years met with due encouragement; and the mass of the people had not been instructed to appreciate the artist. Our condition in that respect contrasted unfavourably with that of other nations. He showed how men of pre-eminent ability had fallen short in performance for want of opportunity. He pointed to Barry, and Hilton, and David Scott, in illustration. On the other hand, it was most true that we had had picture-buyers and collectors amongst us; but they, while they paid high prices for questionable specimens of the old masters, heeded but little what was nearer home. British art and artists had but little sympathy from the dilettanti. It was, however, a pleasing feature of our time, and inspiring to the artist, to know that the demand for the old masters was on the decline. It was time that the buying of spurious copies of the old masters, to the prejudice of the living artist, was brought to an end; * not that he wished to undervalue the real works of the old masters, but that the living and modern artists should be duly encouraged. It was necessary, however, that Art-education should be more general before the more complicated labours of the artist could be universally appreciated. The heaven which the old Puritans introduced into religious matters still showed its effects. In their zeal the storied pane was shattered, the statue defaced, the picture mutilated. Had the mischief ended there, the consequences would have been less important; but the result had been, that the artist was almost wholly excluded from our churches, and until recently was but eharily patronised by the State. If we glanced over the history of Art, we should find that its noblest triumphs had been dedicated to the service of religion. He asked them to have, instead of square yards of stone colour, the works of the painter—the Stable of Bethlehem, the Disputation in the Temple, the Miracles, the Agony, and the final scene on Calvary. By such representations would the words of the preacher be rendered more effective, and the Holy Book better understood. Then would the works of man join in an offering, in worshipping that source from whence all talent, all wisdom, and all power is received;—genius, a gift from on high, speaking through the visible language of the pencil. After alluding to the Government encouragement of Art in the decoration of the Houses of Parliament, Mr. Aitken gave a rapid sketch of the more modern masters of the English School, referring especially to the pre-Raphaelites, who had done much to stem the tide of conventionalism; and if they had accomplished nothing more, had done a good deal by making even their opponents think. In conclusion, he said that the object of his address had been rather to excite the mind of the student to inquire, than to satisfy it; and after giving some practical advice to intending students, he stated that in the library attached to the Art-Studio will be found many works which might be perused with great profit.

* We do not observe that Mr. Aitken made any reference to the leading cause of the change he considers so beneficial. But we are well aware that denizens of Birmingham are afraid to "speak out."

As a guide-book in Art, there was nothing better than Leslie's "Hand-book," the Treatises of Burnet on "Light, Shade, Colour, and Composition." "The Education of the Eye and Landscape Painting" contained a vast amount of information which it is essentially necessary that every intending artist should be in possession of. The "Liber Veritatis" of Claude ought to be examined by every landscape-painter; and equally so the treatises of J. D. Harding on "Elementary Art," "Lessons on Art," and the "Practice of Art." John Ruskin's "Modern Painters" and "Lectures on Painting and Architecture" might be read with much profit. The biography of artists was also instructive reading. They formed incentives to exertion, and were instructive as showing the gradual growth and development of the painter's skill. As an artist should know a little of everything, in addition to a knowledge of anatomy (if he practised the figure), he should make himself somewhat acquainted with the sciences of natural history, geology, and botany. To elevate and store the mind with true poetic feelings the pages of our poets might be perused with great profit. Neither should the pages of our historians be neglected, abounding as they did equally with those of our poets in word-pictures. The artist, to be a true artist, should be educated in every perception and feeling. Doubtless there had been artists uneducated whose works were admirable; but how much more so would they have been had the mind which produced them been educated up to its capabilities? The claims of the Art-Studio, with its collection of paintings, water-colour, and pencil drawings, its books of ornament, its casts, and library, brought together and dedicated by Mr. Underwood to the extension of Art-education, was now before them. The interests of students of fine and ornamental Art had each been duly considered and cared for. In their hands was placed the success and prosperity of the Art-Studio, and shame would it be if, for lack of interest on the part of those for whose benefit it was projected, an institution fraught with so much good, alike to fine Art and Art-industry, should fail for want of that support which it so well merited.

CERAMIC COURT AT THE CRYSTAL PALACE,

UNDER THE DIRECTION OF T. BATTAM, ESQ., F.S.A.

WE have great pleasure in directing the attention of our readers to this project, because of the high degree of interest which must attach to such an exhibition as that proposed, and also from the conviction that its success will lead to the extension of the principle upon which it is founded, to other important branches of manufacture, so as ultimately to realise an Exhibition of Art-Industry of high and uniform excellence without the admixture of works of that objectionable character which have hitherto tended to depreciate the value and influence of previous collections. We extract the following paragraphs from a circular published by order of the Directors in reference to the scheme.

"One of the chief objects originally advocated and proposed by the promoters of the Crystal Palace, was that it should include within its range the materials for an educational system unprecedented, both for comprehensiveness and completeness, and that this should be developed in a form so simple and attractive, that its advantages might be generally and readily available for the instruction of the masses who it was reasonably presumed would be eagerly drawn to profit by its examination.

"The progress of a plan so vast in its scope, and so complex in detail, must necessarily be gradual, since its development involves not only a vast financial outlay, but requires the co-operation of men of eminence in the particular studies selected for illustration.

"Reference to those portions of this scheme already completed, viz. Restorations of the Architecture and Decorative Art of the Assyrians, Egyptians, Greeks, Romans, and Moors of Spain; also of the Byzantine, Gothic, Renaissance, and Modern Italian periods, will demonstrate how far and how successfully this principle has been worked out in regard more immediately and exclusively to the Fine Arts.

The Directors of the Crystal Palace are now

about to extend their sphere of operations to the illustration of Art as allied to Manufacture, and with this view have determined upon the foundation of a Ceramic Court as an experiment, which, if attended with the success they confidently expect, will be followed by a series that shall eventually represent, in its fullest and highest capabilities, the productive power of the principal manufactures of England."

This is certainly progress in the right direction; and if carried out in the spirit which is here professed, will do much to extend the utility and increase the attractions of the "Palace," as well as enlist the interest and sympathy of that large and valuable class of the community, the *élite* of our manufacturers, who have hitherto in the great majority of instances held aloof from connection with its exhibitive arrangements. The publicity which its space offered for the exposition of manufactures generally was at once admitted to be of great value; but so large a sum was demanded for its occupation that numbers, otherwise disposed to avail themselves of its influence, withdrew from so costly a venture, and those who acceded to the terms did so in the determination to adopt such means to secure sales as might "somehow or any how" repay them the heavy tax to which they were subjected; the consequence has been that courses were resorted to which have seriously militated against the institution. At the commencement of the scheme, we repeatedly pointed out the serious evil thus incurred: we did so in vain however: persons were intrusted with the "arrangements," to whom they ought not to have been confided—who had no single qualification for the important task. We protested without effect:—and finding the inutility of "advice," we have for a long period said nothing on the subject—leaving things to take their own course: and that course was ruinous.

This error has been, at length, made apparent, and the future arrangements in this respect give hope of greater consideration—indeed, we may say liberality—towards exhibitors, by which such a class of "exhibitions" will be secured as must prove a source of remuneration and deserved attraction.

Obviously, the best policy of the Directors is to seek such "deposits" as shall increase the sources of revenue from an additional number of visitors, rather than from the exhibitors.

In making these remarks we refer to the productions in the higher branches of Art-manufacture, the exhibition of which is certain to be attractive, and the illustration of which must necessarily be costly to the manufacturer. We understand that the works admitted to form the collection of the Ceramic Court will be received free of all charge to manufacturers and exhibitors; and, consequently, *no work will be included but that which in its kind possesses the claim of positive excellence.*

The selection of Ceramic Manufactures as the initiatory step in this movement is, we think, in the highest degree judicious. In respect to this, the circular to which we have referred adds—

"It would be superfluous to enlarge upon the interest which will attach to a collection of rare and valuable objects, illustrating the beauty and variety of a manufacture with which Art formed so early and intimate an alliance, and which presents, through all its details, a combination of science and art without a parallel in the whole range of industrial action. The national importance of our potteries, in a commercial point of view, is not yet thoroughly appreciated. They call into exercise important powers of chemical analysis and mechanical ingenuity, and they develop artistic faculties to an extent and with a fitness certainly unequalled in any other branch of manufacture. It is of especial importance that the English people should have some intimate knowledge of the nature and extent of their own commercial resources, for without such a knowledge they can never properly appreciate their national interests.

"The proposed exhibition will contain a large and valuable collection of Plastic Art, from the earliest dates of its invention down to the present time.

"The collection of modern works will, it is presumed, exemplify the perfection to which the

various branches of this manufacture have attained, and as regards England, entirely by individual enterprise, unaided by state subsidies."

In respect to the productions of the present day, it is now a fact admitted by all who have had opportunities of comparative analysis, that English Ceramics take a high and proud position, and, with the solitary exception of the Royal works at Sèvres, stand unrivalled; by none is this superiority more readily acknowledged than by our continental rivals. The fact was established at the late Exhibition in Paris. The rapid advance in this branch of English manufacture is without a parallel in Industrial Art, and forces the conclusion that judicious patronage alone is requisite to realise a success "at home" equal to the highest foreign achievements. We are sanguine that the result of this exhibition, combining, as it will, the finest works of foreign talent in immediate proximity with those of English produce, will be largely influential not only in stimulating further advance in those improved features in which the Staffordshire potteries, and those of Worcester and Coleport, are so satisfactorily progressing, but also in more fully developing those in which they are already decidedly superior. It will also tend to cause that excellence in the highest field of labour to be permanent and general, which is from want of public appreciation and encouragement but occasional and exceptional,—a want in a considerable degree attributable to *inadequate representation.*

It is true that Exhibitions of Industrial Art have been of late years tolerably frequent: but their exponents have been of too mixed a character to be of that influential value as attesting the high capabilities of English manufacture which a more qualified and restricted admission would have secured. A space having been once assigned to an exhibitor, its occupancy was left solely to his own discretion, and the result has too often been that works of indifference or of inferiority have unfortunately tended to neutralise the influence of those which were really meritorious, and led to the assumption that the latter were more the result of chance or imitation than of purpose and originality.

To select one qualified to exercise such a judgment as the successful working of this plan necessarily involves, was a matter of extreme difficulty, and the Directors in securing the services of Mr. Battam have been singularly fortunate. The high position he has long held in connection with this branch of manufacture, the practical knowledge he possesses of its various stages and manipulation, have at once enlisted the full confidence and hearty co-operation of the leading manufacturers—many of whom are now engaged on special works expressly for this Exhibition, as well as reproductions of those important objects which attracted so much admiration and won such high awards at the recent Paris Exhibition.

We look confidently forward to the complete success of this work, which, we understand, will be ready for public inauguration on the 1st of May.

The subject is one, as our readers know, in which we have ever taken a deep interest: if there be any branch of British manufacture which has derived assistance from the *Art-Journal*, it is that of the English potteries: it will suffice to say that twelve or fourteen years ago, when we began to report their position and progress, and to illustrate their leading productions, they were in a very different state from that in which we find them now. During our earlier attempts to represent Industrial Art, we were cordially and zealously aided by the producers of this class of British manufacture: it was with them, indeed, our movement was first commenced. Other producers followed in due course: but we have not forgotten, and are not likely to forget, that from the potters we received that support which stimulated us to exertions when difficulties were many and encouragements few.

We expect from this very satisfactory effort at their due and proper representation, a very large and very rapid advance: it will be no doubt our duty to co-operate with Mr. Battam, and to aid his movements by engraving from time to time many of the leading objects exhibited.

THE ROYAL PICTURES.

THE WALK AT KEW.

T. Gainsborough, R.A., Painter. C. H. Jeens, Engraver.
Size of the Picture, 5 ft. 3 in. by 3 ft. 11 in.

GAINSBOROUGH was a man singularly endowed with the gifts of Nature; handsome in person, gentle and always cheerful in disposition, of brilliant conversational powers, well skilled in music, of rare and varied talent as a painter, blessed at an early age with a wife in every way suited to him, and with the additional advantage of possessing an income that placed the young couple (neither had seen twenty years when they were united) in comparative independence: seldom, indeed, has an artist entered into the uncertain arena of his profession under such favourable circumstances. But his art was his idol—next to his Margaret—and in spite of clouds, which will occasionally flit across the brightest skies, he threw his entire soul into the work he had chosen and for which he was so fitted, and his success was commensurate with his enthusiastic devotion.

Historical painters are very frequently great in portraiture, but it is most rare to meet with landscape-painters who excel in portraying the "form and lineaments" of the human face: Gainsborough was one of the few masters of both styles; so much so, that critics have pronounced a divided judgment as to which to give the palm of superiority. At one time busy amid the green lanes, and verdant fields, and the homely cottage children of his native county, Suffolk; and at another immortalising on his canvas the features of the great men who thronged the Court of George III.; he seemed equally at home in both. "He is the best English landscape painter," &c., Reynolds is reported to have said of him one day in the hearing of Richard Wilson;—"He is *not*," replied the latter, "the best landscape painter, but he is the best portrait painter." Although these opinions were doubtless not exactly those which the two speakers, who were no over-friendly towards each other, really entertained, they may be accepted as tolerably correct evidence of the high estimation in which both held Gainsborough.

If we accept the dying words of the artist—words spoken when the shadows of death had more than half obscured the light of an intelligence yet busy with the memories of his Art—as indicating that class in which he most delighted, we may assume it to be portraiture. A short time only before he breathed his last, he exclaimed with unusual rapture,—"We are all going to heaven, and Vandyke is of the company!" But they who associated with him, and best knew his feelings, have recorded that he never desired to rest his reputation on his portraits; they were the "business" part of his profession, not its pleasant pastime; he loved to exchange the lace and ruffles, and satin vests, and well-turned perukes of fashionable life, for the straw-hat and coarse habiliments of some ruddy-cheeked maiden at her cottage-door, or sturdy waggoner "driving his team a-field."

The picture in the Royal Collection here engraved unites the two styles of portrait and landscape, though the latter has an aristocratic character which carries us away from the painter's usual sylvan scenery: the carefully-trimmed lawns and graceful foliage of Kew-gardens differ essentially from the homeliness and rusticity of his Suffolk views. It is altogether elegant in composition—in the bearing of the figures and in the forms of the trees—except in the angle caused by the arrangement of the ladies' dresses; this is not agreeable to the eye. The personages introduced are presumed to be—for some doubt has been expressed on the subject—Henry Frederick, Duke of Cumberland, third son of the Prince of Wales, eldest son of George II.; his wife, Anne Horton, daughter of Lord Iruham; and the Lady Elizabeth Luttrell: the duke died without issue, September 18th, 1790. It was this marriage, and that of Cumberland's brother, the Duke of Gloucester, who married the dowager Countess of Waldegrave, that led to the passing of the "Royal Marriage Act."

The picture hangs in the corridor at Windsor Castle.

WINSBOROUGH PINX

1751

THE WINDMILL

FROM THE PICTURE IN THE ROYAL COLLECTION.

LONDON: PRINTED BY J. JOHNSON, ST. PAULS CHURCH-YARD.

PHOTOGRAPHIC EXHIBITIONS.

THE Photographic Society has during the month opened its third Exhibition. Fenton's Crimean photographs (noticed *Art-Journal*, October) are now exhibited in Pall-Mall; and Robertson's photographs, taken after the fall of Sebastopol, are to be seen in Regent Street. The fact, that three exhibitions of sun-drawn pictures are open in the metropolis at the same time, sufficiently proves the growing interest in this beautiful art.

The present appears a favourable opportunity for examining the state and prospects of photography—and, with these public exhibitions to refer to, we shall find no difficulty in directing attention to illustrative examples of each point with which we shall have to deal.

During the last year or two, there have not been any considerable advances in the science of photography, but the art has been greatly improved. When the discoveries of Daguerre and Talbot were first published to the world, several experimental philosophers seized upon the subject, and their industrious researches were soon rewarded by the development of new and unexpected truths. These directed the way to secure improved sensibility in the photographic agents, and pictures were in a little time produced, in a few seconds, superior in all respects to those which formerly required, often, nearly an hour for their development. Herschel, for example, was the first to point attention to the importance of organic bodies in combination with the salts of silver. He showed that the equilibrium was more readily overturned, and the system of chemical decomposition more rapidly carried forward, when the metallic salt was associated with some of those carbon compounds, which especially possess the power of removing oxygen from substances with which it is associated.

A knowledge of this fact led to the use of gallic acid as an accelerating agent, and, although unfortunately the steps are wanting, and we are prevented from tracing the progress of the discovery, we find photographers advancing from the use of paper, to the employment of gelatine and albumen, and eventually to the introduction of that important agent, collodion. Collodion proved so distinguishingly an accelerating power in photography, that almost every other preparation has given way before it.

In proof of this the present Photographic Exhibition numbers 606 frames of photographs of various kinds. Of these there are of pictures by the

Waxed paper process . . .	64
The Calotype	78
The Daguerreotype	3
The Collodion	461

606

This large majority of collodion pictures is, we believe, mainly referrible to the remarkable facility of the process. The preparations required can be purchased ready for use—and it is almost impossible for the veriest amateur to fail of obtaining a picture. We are rather disposed to think that the discovery of the collodion process has had an injurious tendency in stopping enquiry. The pictures obtained are generally so excellent, that little is desired by the photographer beyond the means of ensuring the permanence of his productions. We have had numerous valuable suggestions for the improvement of the collodion process, many of which have been adopted, but no

one appears to attempt an advance beyond this. There is no reason why other agents possessing all the advantages of collodion, and some which are yet a desideratum, should not be discovered. It is with some regret that we visited the three exhibitions of the Photographic Society, without discovering, with one exception, any evidence of the study of photography as a science. Amongst the members of the Photographic Society we see the names of men eminent in their especial departments of science; and there are others who, although young, have given evidence of their powers to carry forward original research. Why is it, then, that the exhibition is almost without examples of experimental enquiry? Why is it that the Photographic Journal gives no evidence of the progress of scientific investigation? To produce a picture, the process being given, is excessively easy; any one with industry may succeed in this and even excel; to enquire into the physical and chemical phenomena concerned in the production, is a task demanding much higher powers. There are, however, two frames in the exhibition illustrating—one, the action of the *hydrosulphide of ammonia*, and the other of the *permanganate of potash* on finished photographs, which are excellent examples of one line of enquiry. These are by Mr. F. HARDWICK, who has carefully investigated many points in the chemistry of photography, and he, in these examples, seeks an elucidation of the conditions under which photographs are found to give way; these demand a careful study. We have on a former occasion devoted an article to the subject of the fading of photographs, and we still hold to our opinion, that a sun-drawn picture may be rendered absolutely unfading under any of the ordinary atmospheric influences, proper care being taken in the manipulation. So much for the condition of photographic science. Now let us look at the art.

The third exhibition of the Photographic Society is an exceedingly satisfactory one. We miss the productions of some well-known photographers, but they are replaced by others, differing from the older hands in style, but in no respect inferior to them in general effect. We conceive there is more harmony—more delicacy—throughout the pictures than formerly. The printing processes have been more carefully attended to, and we have less of that hard contrast, of intense shadows with high lights, than formerly. We also see that the art of photography has had the advantage of leading its students to look at nature with a more careful eye than was their wont. The results of the camera obscura have not always been found to be quite agreeable; sometimes the sunshine, or rather the effects, upon the landscape, were offensively brought forward, and violent results not unfrequently marked the photographer's studies.

These defects, however, our more advanced photographic artists have learned to avoid. They now select natural objects under their more favourable aspects; they look at nature with an eye to the impression which her illuminated surface will make on the chemically prepared tablet; and they select those conditions of light and shadow which give a pleasing photographic result.

Some of the landscapes, especially those by J. Knight (497, 502), several by J. D. Llewellyn (504, 511, 411, 443, &c.); T. W. Ramsden's scenes in Yorkshire (533, 545); F. Scott Archer's views (61, 62); those by W. Pumphrey (127, &c.); the delightful little bits of nature by G. Shadbolt (34, 57, and

58) will, upon careful examination fully confirm our remarks.

"Inhaling the Breeze" (58)

"breathing from the meadows,
As the west wind bows down the long green grass,
And the light clouds pass as they were wont to pass,
Long time ago!"—

by Mr. Shadbolt, possesses to us an inexpressible charm; there is a quiet poetry, and a fulness of light about the picture which is magical; it is like a picture by Turner, we can almost feel the west wind soft and balmy. Pre-Raphaelites might study this and some other photographs, and learn how the sun paints, disclosing every minute line on trunk and leaf—yet blending all into one—light melting by undulations into shadow, and shade brightening into sunny glow, like the illumination on summer seas. For minute and yet distinct detail of a peculiar kind, charming in its general effect, we would name (557) *Ferns and Brambles*, by H. White. In one picture by Mr. Archer, and in Bantry Bay (14) by T. Cadby Ponting, we have natural clouds, but we think we have seen more delicate and beautiful copies of "Cloudland" than those. How valuable to the artist would a good series of photographic cloud-studies be, since few know how to paint them!

There are many fine examples of "Ruined fanes, relics of hood and cowl devotion," of crumbling castles and tottering mansions, which show the manner in which Time's effacing fingers produce disintegration of the solid stone. The weather-worn fragment is depicted with every scar upon its face, every channel which the rain drops and the wind has worn. *Scenes from Kenilworth* (45, 46), Dolamoor and Bullock; *Ludlow Castle* (10), Rev. H. Holder; several portions of *Windsor Castle*, by A. F. Melhuish; *The Choir, Canterbury Cathedral* (183), F. Bedford; and some similar productions by V. A. Prout, are excellent studies. Few men could paint as the sun paints; it is not to be desired that they should do so, since the expenditure of time in producing all this wonderful detail would swallow up too much of a man's life, and it would, we fear, as a final result, produce marvellous mechanism, to the sacrifice of mind. Photography has its uses,—we fear we see its evils, or abuses, in the way in which some of our artists employ the photographic copy of nature, instead of looking at nature with their own eyes, and mentally fixing some of the ever-varying images which are drawn upon the tablets of those wonderful stereoscopic cameras, the human eyes. Yet many are the lessons, if read aright, which are taught by photography.

O. G. Rejlander and Lake Price contribute several artistic studies of a far more ambitious kind than we have hitherto seen. They are all wonderfully clever, but after all they are but the images of actors posed for the occasion; they all want life, expression, passion. Passion they have none, and yet these pictures tell a pleasing tale. *The three Subjects* (4), by Rejlander, are exceedingly well treated. *The Breakfast Table*, by Lake Price, is a pretty comfortable English interior, in which all is happiness and peace; let us hope it is the artist's home. *The Wolsey—Charles Kean*—(135), by the same photographer, is an exquisite portrait and a fine picture. *The Monk* (150), also by Mr. Lake Price, and its accompanying studies, are good in their way, but they are dramatic representations; and this applies yet more forcibly to the *Scene in the Tower* (139), in which the murder of the young princes is the subject. We doubt the propriety of attempting to rival

the historical painter. We believe, indeed, that such pictures as those will have a tendency to lower the appreciation of Art in the eyes of the public, and unfit them for receiving the full impression intended by, or of seeing the beauties of, the artist's production. We do not mean to disparage the works of Mr. Price or of Mr. Rejlander, they are excellent of their kind, but our love of High Art leads us to desire not to see too many of this class of subjects. J. Watson & Co. exhibit an *Academic Study* (227), and the *Broken String* (259), which must also be regarded as an artist's study, and both possess very great merit as such. We have in this Exhibition numerous examples of the applications of the photographic art. *A Frame containing four subjects of Cuneiform Inscriptions* (201), by Roger Fenton, which are copies of the natural size of clay tablets brought from Nineveh, are wonderfully exact. It would be an almost endless labour to draw these relics of Assyrian story by hand—and here we have every character, by one impulse, faithfully depicted in a few seconds. We have *Hindoo Antiquities and Egyptian Bas-relief* (210) as other examples of the same class.

"One of the Engraved pages from the German Edition of the *Ars Moriendi*, Black Book, date about 1470" (198), Mrs. L. Leigh Sotheby, furnishes another example of important applications of the photographic art. There has been some discussion on the question of copying valuable records, manuscript and printed books. We have seen examples sufficiently numerous to convince us that any of those things can, under almost any conditions, be faithfully copied by the collodion process. Dr. Diamond has shown the antiquary how excellently well coins can be copied, in the *Tray of Admiral Smyth's Roman Coins* (434); and C. Thurston Thompson exhibits the application of the art in copying enamels (585, 594), Art-manufactures (597), and furniture (603). Portraits are numerous, and many of them excellent; we hesitate to particularise, but we must mention Mr. Fenton's *Prince Napoleon* (213), and *Sir Colin Campbell* (195), and Mr. Myall's portraits of *Sidney Herbert* (337); *Lord John Russell* (338); the late *Sir William Molesworth* (339); *Sir George Grey* (371); the *Earl of Aberdeen* (372), and *Sir Cornwall Lewis* (373). Thus our heroes and statesmen, as they lived and looked, are preserved to us, and their lineaments handed down to future ages. We think we have said enough to prove that the present exhibition of the Photographic Society is well worthy of close examination.

Of the Crimean photographs of Mr. Roger Fenton we have already spoken (*Art-Journal*, October, 1855). Mr. Robertson, chief engraver to the Imperial Mint, Constantinople, has produced an interesting series of views taken in the Crimea after the fall of Sebastopol, which are exhibiting at Mr. Kilburn's, 222, Regent Street. The sad tale of destruction is here told with strange exactness. The Redan with the breach where the great struggle took place; the Malakoff Tower and Battery, and other celebrated scenes of "bloody strife," are brought home to us, with fascines and gabions, in confusion thrown, in a manner which no artist could realise. We were especially struck with the *Barrack Battery*, showing the mantelettes for protecting the Russian gunners. Here, we see the excellent engineering of the Russians; and we learn to appreciate the value of these rope protections (*mantelettes*) for the gunners from the rifle-balls: these we have heard a

competent authority declare to be the crowning invention of the war.

Sebastopol and Balaklava, with all the strange confusion which distinguishes both, are before the beholder. The curious may find everything here to gratify them. The locality of each heroic or sad event is chronicled. The geologist may study the rocks of the Crimea without crossing the sea; and the architect the buildings which decorated this fine city. The trenches, the tents, the huts, are respectively represented; and—"last scene of all this sad eventful tragedy"—we have the *English Burial Ground on Cathcart Hill*, with the monuments of the brave men who sleep in the embraces of death, but whose memoirs are dear to the country of their birth, where their names will live and kindle heroic life in the souls of those who must preserve the high character of the Briton for courage and honour.

Photography has achieved wonders. Let any one visit each of the three exhibitions which we have named, and we feel conscious they will leave them with a full conviction that the Art which has achieved the end of the enchanter's mirror, and preserved for us, and shown to us, shadows which cannot fade, of persons and of things which are lost us, or at a distance from us, must produce yet greater triumphs with each recurring year.

The sun, which gives light and colour, has answered the call of the evocator, and become the painter of the objects which it illuminates. In obedience to the bidding of the philosopher it will give us yet more truthfulness, and show us still nearer approaches to life.

R. H.

DEPARTMENT OF ART EXHIBITION AT GORE HOUSE.

AN Exhibition of productions of the Metropolitan and Provincial Government Schools of Art, has been open to the public during the last month at this branch establishment. The house outside has but little of an official character; and with its high wall in front—lofty trees surmounting it, and carriage entrance with two gates, has more the appearance of a lord of the manor's residence on an old coach road, than an abode of the Muses. It has undergone a curious change of occupancy within the last few years—within which it has been by turns the residence of the accomplished Lady Blessington;—the 1851 *café* of M. Soyer;—and now lastly the country seat of the Metropolitan Department of Art; Marlborough House, St. James's, being the town residence. It has for some time past afforded exhibition rooms for the works of the students contributed for prizes. These are divided into two collections, and exhibited at different times of the year;—the present one being wholly elementary, consisting of outlines and perspective studies, and of drawings and paintings from the flat, chiefly from examples directly applicable to decoration;—the only departure, from set copies being some drawings—but not paintings—from natural flowers and from casts. These studies, like a child's A B C, or the first chords on an instrument, though indispensable are not very amusing, and are judiciously exhibited at a period when few visitors can be expected as far as Kensington. The more advanced, inventive, and popular portion of the prize efforts of the students is reserved for the merry month of May. The present collection presents the usual features. Many of our old friends in decoration reappear for the thousandth time. Two of the examples, however, there repeated in many copies are Moresque,—the department, doubtless, desiring to vary the character of the studies. The general display is creditable—but of less interest than that to be expected in the spring, when of course it is an

object to render the exhibition as attractive to the public as its nature is capable of.

We are very glad that the responsibility of the Sunday opening of public instructive exhibitions to the public rests not with us; but if the movement to this effect, which appears gaining strength, be realised, this is one of the exhibitions perhaps to be included—as affording to those who have not in the week-day the opportunity of wandering so far a-field, the advantage on Sunday of seeing much that is soberly, as well as practically, instructive; and this close to Hyde Park and Kensington Gardens. The gardens also of Gore House, and the adjoining establishment, are far from devoid of beauty, and would add a new feature of instructive recreation, if they afforded a school of Botany. Open air flowers, which would flourish in that situation, would alone yield both popular and special instruction without vying with the elaborate arrangements of the gardens of Kew, which have now, for two years, been open every summer Sunday; and are found, on that day, to occupy no more officials than are daily necessary to water and give air and light to the plants. But without going into the pros and cons of Sunday instructive amusements, it may be well to add, that there appears an evident demarcation between illustrating, in an exhibition, the works of God and those of man on that day; inasmuch as nothing can be drawn from the former by a right mind, but considerations strictly adapted to the seventh day,—while the works of man may lead involuntarily to a thousand other ideas more appropriate to the other six. Viewed in this light, Gardens,—Botany,—Geology,—the study of animals past and present—may be considered more in accordance with the sacred day than the products of Art and industry. A select collection of Sacred Christian Art however, united with a well-ordered display of the various branches of Natural History, might afford a profitable addition to the subjects of thought on the artisan's Sunday,—and not be foreign to the future purposes of this beautiful portion of London's suburbs.

MEMORIAL FROM THE INSTITUTE OF BRITISH SCULPTORS TO THE ROYAL ACADEMY.

WE understand that a memorial, emanating from the Sculptors' Institute, and signed by the members of the profession generally and other artists and lovers of Art, is to be submitted shortly to the Royal Academy, to the effect that some of the lighter and more poetic works of sculpture to be contributed next spring to the annual Exhibition of modern Art in Trafalgar Square, be placed in the centre of one or more of the rooms, the sides of which are appropriated to paintings, &c. This proposal is supported by the example of other collections of Art,—by that of ancient works in Florence and elsewhere, and of the arrangement of the "Beaux Arts" in the late Exhibition at Paris. We need hardly say how much such a movement is in accordance with our own feelings, having considered it but a duty of late years to make an annual exposition, "usque ad nauseam" perhaps, of the inadequacy of the arrangements for sculpture in our national exhibition; and having but lately drawn the attention of our readers, in our general notice of the modern European sculpture at Paris, to the advantages there arising from the juxtaposition and fraternity of the two Arts; and how they mutually and practically gain from a union which is so graceful in theory. We hope the Academy will incline to add this new grace to the reforms which we are glad to see making their way in that Institution, and that the proposition may meet with success. It is perhaps the best that can be carried into effect, short of a thorough arrangement of sculpture in a large hall specially adapted to that art, with all those arrangements of colour that will welcome the white tint of the statues as the one, thing

needful, for the completion of the composition of colour afforded by the whole apartment. This is the mode in which colour should be associated, in our belief, with statues—not by colouring or tinting the statues themselves—which though lately revived on the somewhat doubtful authority of the ancients, and perhaps prevailing somewhat for the day, will soon be set to rest by our taste for simplicity; but by arranging the colours of the floor, the walls, hangings, and the whole *entourage*, so as to demand the introduction of the local tint of marble, &c., make up the picture. Of such a nature is the best arrangement for sculpture generally, although even then we would have some few works of this Art in companionship with painting, where the architectural arrangements will allow of it. As it is, and for a beginning of reform, the centre space of the large room evidently offers a convenient area for a few of the lighter and more poetic works. Such examples will be chosen, probably, for this situation as present an ornamental mass and outline, and will not be injured by being directly under the light. Much of their effect will depend on their being symmetrically and harmoniously arranged. The subject assuredly justly requires attention; for the accommodation which sculpture has hitherto had in our national exhibition, is of a nature to degrade it in the public appreciation, check the aspirations of its followers, and entail great difficulties on the arrangers, as there are not more than half a dozen tolerably lighted spots within the area of the so-called sculpture-room; all the rest being miserably inadequate in this respect. Moreover the entrance-hall, through which it is approached, is decorated with casts from some of the finest ancient works, and are there *well-lighted*—which emphasizes most unhappily the comparative short-comings that must ever exist in an annual exhibition—affording the injudicious contrast of the selected works of all time *well-lighted*, with the efforts of one year of a little encouraged Art in our own country *ill-lighted, and equally disadvantageously placed*. It has not unfrequently occurred, doubtless, that the entrance-hall affords a better site for the annual contribution of sculpture, than the room so long misappropriated to it—and on one occasion this view was partly acted upon—but of this the next exhibition witnessed no continuance.

The proposition appropriately emanating from the Institute of British Sculptors, will no doubt bear its fruit in due season. We trust the experiment proposed will be fairly tried, and that hereafter it will lead to still more desirable results.

ACADEMY REFORM.

THIS is a subject which according to the constitution of our Academy is extremely difficult of approach, though with reference to foreign academies and by continental writers it is very freely treated. The subject does not occur to us as immediately *appropos* of those grievances so extensively complained of by non-privileged contributors to the walls of the Royal Academy; but suggested by the complaints of a certain Don José Galofre against the Spanish Academy of San Fernando, adversely commented by a German critic. What we therefore advance, inasmuch as it bears upon general abuses, is but a brief *hyper* upon the German critic. Our own academy reminds us of the Palace of Eternal Silence in the eastern tale—how vociferous soever may be those who have not yet been admitted to the honours and the privileges of the *penetrabilia*, their voices are gone as soon as they are within the threshold, and everything is seen of the same tint as that thrown upon Dannecker's Ariadne at Frankfurt—it is called by our French neighbours, *couleur de rose*. Don José Galofre insists upon the inutility of academies; our German critic (whose name by the way we are sorry not to be able to give) insists upon them as a necessity—so do we. It cannot now be urged against the academy that they do

not educate their own figure painters—or that their figure painters can draw no better than Reynolds or Fuseli. It is only by a regular education in Art that accomplished painters are made. It is only by severe academical study that the essentials of an Art-education can be obtained. The great fault of our school has been, that its members have commenced the study of their art by painting instead of drawing: thus, when the French school was drawing and painting dramatic demi-gods with almost Greek accuracy, our artists had not yet got beyond portrait and rustic figures. But this is more particularly the question between the academy and the public—there is yet another question between the academy and the “outside” members of the profession, more immediately injurious and unjust—that is, the right of a class of men so privileged as to be enabled to pronounce a tacit condemnation of the works of worthy members of the profession, by exhibiting them in places always assigned to inferior productions. This is a question which divides no other school of Art but our own, for in every other there is a greater measure of justice in the exhibition of works of Art. To this all the objections of the Spanish writers—all the protestations of the German commentator are as nothing—neither of these gentlemen has ever known the horrors of an octagon room, nor have they or either of them ever been elevated to the sky-line of their own academy, or had their works placed among architectural drawings. When Peter Cornelius and all young Germany with him, retired from the school (Imp. und Königl.) of Vienna because they declined working from the poetic conceptions of the immortal and God-like Greeks, they had no further complaint against academies, but straightway established their own “aesthetics.” Declarations of the want of patronage for “high art” are not peculiar to ourselves. “Of what use,” says the Spanish writer, “are beautiful pictures and classical statues if they are not admired and sold?” This default with all their government patronage is common to every existing school. It might almost be supposed that in other countries, Art was followed as a profession to an extent beyond the means of patrons and governments to find employment for the increasing generation of painters. This progress with respect to ourselves, is ignored by our academy, whose numerical status has been the same since the day of their establishment. Our academy is a *quasi* self-supporting institution. It were to be desired that it were not so, anything were better than its present exclusiveness. The Royal Academy may ask with ourselves, and with the writer who so boldly attacks these institutions, which exist each as a paradise of painters, in comparison with our own close citadel of art—its members, we say, may ask what real advantages governments can show in return for the large sums they annually expend in the support of Schools of Art. It is true that none of the great masters arose from government institutions—there were no public schools in the days of Bellini, Titian, Raffaele, Michael Angelo, Vandyke, Rubens, Velasquez, Murillo, and Ribera, nor did Phidias, Praxiteles, or Apelles rise from public institutions. Genius, like corn, will therefore come to maturity, independent of protection. Yet, for ourselves, we still would not dispense with academies. Had Rubens been educated in an academy, he certainly must have drawn with more accuracy and elegance, but not so characteristically. Had Michael Angelo been bound by academic rules, would his “Last Judgment” be what we now see it? We have alluded to the vulgar outcry against the Royal Academy for not forming their own members. In order to meet this objection they now elect few, save their own pupils—a tacit demonstration, and by no means a wise one, against the talents of the outside strangers, many of whom are men of distinguished merit. To touch upon one, and one example only—it is very certain that Linnell was once desirous of becoming a member of the academy. Is it true, that Linnell having made a reputation in spite of the academy, has been solicited to become at once a free member of the body, and has declined the honour and

its privileges? It is patent to the commonest understanding that the academy is disproportionately short of what Tenson, the bookseller, used to call “able hands,” in the landscape department. The reply of the academy to this assertion is the question, “Who is there fit to be elected?”—we could mention some few, much superior to their present landscape section, but we will mention no names in seeming partisanship. The subject is an extensive one, and we may deal with it *in extenso* on some early occasion. These remarks are only brought forward by a show of reproach against foreign academies—which are not subject to the government of interested authorities, and from which there is no undue exclusion. But notwithstanding these objections academies have greatly advanced the elements of true Art. It matters little to what modern time or school we turn, if there be any great default it is always traceable to the want of academical education. But that the pretensions of pedantry in this are offensive, and unintelligible, we need only instance the unpopularity of the hard German *purist* school, the manner of all those who went with Overbeck, but who have fallen short of the distinction to which he has attained. The larger section of German painters who were first captivated by the novelty of “Christian” art—saw wisely when they saw cause to forsake the thorny path of inexorable outline and to appeal for relief to the light and shade of nature. Those men who merely painted heads could not be said to draw. With all the learned discourse about Rembrandt's Mill and his “dark imaginings,” had he never seen a mill he would have painted just as he did—but had he been educated he would have worked very differently. Reynolds painted heads and was a master of effect, but he could not draw. If Rembrandt and Reynolds could have drawn, would they have been as popular as they are? Certainly not in the same way. We do not say that a knowledge of drawing would have made them worse artists, but they might have practised their art in a manner less calculated to impress the mind. We scarcely know what Don Galofre and others who desire to reconstruct the academies of the continent would propose—but their expositions amount to nothing in comparison with the abuses which exist in the Royal Academy. If the plaintiffs be painters, their works have been fairly set before the public, and their reputation is in the hands of the public, not in those of an interested corporation.

THE ARCHITECTURAL EXHIBITION.

THE slight notice we could afford, last month, of the Architectural Exhibition, was not sufficient to give an idea of the interest which on examination will be excited by the works displayed in the Suffolk Street Galleries. Considering the object of architectural drawings, it may not be expected that these should at first captivate the common eye,—like the more seductive beauties of works of the class usually exhibited. An architectural drawing is not designed, itself, mainly, for the effect on the beholder; but it is rather the *diagram* conveying explanation of the real work of Art intended. Therefore, although all classes of Art-works deserve to be *studied*, architectural drawings peculiarly require to be viewed in such manner; and this will be better understood by an allusion to that class of drawings most used by architects, and necessarily so,—for these—where the plans, elevations, and sections are looked at, as they should be, in combination—convey what might be supposed to be given by a model of the building; whilst the perspective view can present but an indifferent representation of the structure in a single aspect.

Though these points should be perfectly clear to all artists, there has been so much of isolation in the different branches of Art,—a state peculiar to our time, and unfavourable to Art generally,—that we deem it necessary to dwell

upon them,—that it may be seen how desirable it is that drawings of an apparently technical nature, should be found on the walls at the Architectural Exhibition, even to a greater extent than they are; and that the gratification which the collection can afford, should be sought through intelligent study,—which indeed, it is needless to say, is always the medium most fruitful in intellectual benefit, and the higher and durable kind of pleasurable emotion.

Judging by the number of persons who have taken season tickets, and the large and attentive audiences at the lectures, we think we may say that the interest of the public has been excited; and much benefit will result to Art generally, from this better appreciation of architecture. There are of course, for Arts like painting and sculpture, walks which may be separately followed; and in these, our country holds no low place; but there is, notwithstanding, a particular walk, and that perchance the grandest, in which neither the supposed high Arts of painting, sculpture, and architecture, nor the extensive branch of industrial and ornamental Arts, can be parted from the sphere of one comprehensive scheme and motive. The architect views his Art as embodying all that pertains to the form and structure, and the decoration, and furnishing of buildings: and if he went even further, he would have the history of Art, and examples from its best periods still as evidence on his side. But this view, and that of the necessity of architectural Art to the cultivation of the higher fields of painting and sculpture, has been before dwelt upon in these pages, as in the papers some time back, on the Halls of the City of London.

Although the opposition of opinion which prevails in the profession,—and of which, works in the present Exhibition are evidence—is not wholly favourable to the comprehension of architectural Art by the public; there are yet proofs of an amount of progress in all respects, which is very gratifying to those who, like ourselves, have striven to bring it about. It happens indeed that a great proportion of the drawings represent churches, cemetery buildings, and schools;—these being almost universally in the Gothic style,—in which we are constrained to think that much inventive skill is not just now shown. At the same time, there is ample evidence of general advantage as having accrued to the Art by the study of Mediæval works. Knowledge of perspective, and skill in delineation, of course form the mere means for the creation of Art: still it is not unimportant to note how these have been fostered,—albeit, allowing that the neatness and precision of French drawings may suggest that deficiencies still exist on the English side. But the real cause for congratulation is the steady growth of what has been lately dwelt upon in a leading article in the *Times*,—namely, the principle of truth in structure. During the period which immediately preceded the revival of Gothic architecture, even in works of great pretension, there had been an entire forgetfulness of the necessity for unison between the uses of the structure, as well as properties of the materials used in it, on the one side, and the expression of Art on the other. It is clear that, if these uses are not necessarily to be prominently expressed, there should at all events be no effect which is discordant, or inconsistent with them. Each material, for example, having its own physical properties, these are to be made the most of, in place of using one material in the form which had been characteristic of another; or, as it has been said, iron-work should be treated as iron-work, and cement as cement; in neither should we seek to imitate stone. To act otherwise is at once to court the appearance of pretence, and of inferiority, which, as we have often tried to urge, gives the very impression which is repulsive to Art. The only error which we believe is made by the advocates of *constructive truth*, is in the supposition that it alone will make the beautiful; and this is an error from which neither the article in the *Times*, nor the subsequent correspondents of that journal, were free. That article, however, alone, is perhaps one of the greatest services ever rendered by the general press to Art; and had the same interest been taken, as well as enlightened judgment shown, in archi-

tectural Art before, it would not have remained so long in an abject position.

One of the principal evidences which the Exhibition affords, of the gain from the study of Mediæval Art, is to be found under the class of metal-work. Of this kind of Art-manufacture, Messrs. Hart exhibit the remarkable collection which they had in the Paris Exhibition, in addition to other works. Though there is a tendency in some of these, towards exact reproduction of natural forms, the whole display is creditable both to the manufacturers, and the designers they employ.—Mr. Tineft has attended to this branch of his art with much success, as shown by the drawings of doors from his designs, where iron-work tracery is fixed in glazed panels.—Amongst the specimens of decorative work, Mr. Simpson's paper-hangings—of Mediæval character—may be referred to with approbation; and Mr. Leake's leather-hangings, Mr. Stevens's glass mosaic, and the decorated glass panels exhibited by the Ladies' Guild, are inventions capable of being turned to much account. The best of the specimens of decorative painting are those exhibited by Mr. A. Remon. In some of these works, however, and in the whole lot of designs by Messrs. Galli and Cotti, and others by Mr. Kuckuck, the structural principle is lost sight of,—allowing that both prolific fancy and executive skill are not wanting. Indeed the Italian artists named, deserve especial notice for the excellent specimens of fresco-painting which they exhibit. In their designs, the error has been the following out that style of degenerate Italian which was precisely what led to the evils we have referred to, as corrected by the revived Gothic. It would be well if the decorative designers who this year exhibit, would devote some study to this latter style,—though without falling into the error of many of those who follow it,—for which, the loss of their inventive skill would be a poor exchange.—Mr. Kershaw exhibits a door, where the panels are painted with fruit and flowers in excellent style; and Mr. E. Morley's specimens of floral decoration—besides being executed in a vehicle which dries “dead,” yet appears likely to be durable—show him to be a competent hand in his class of subjects.—Messrs. Jackson & Son in specimens of papier-mâché, and carton-pierre; Mr. Pierce in stoves and chimney-pieces; Messrs. Bowden & Co. in ornamental cut glass, and Mr. L. W. Collman, in a carved oak mantel-piece, exhibit some of their best work; but there are in addition many specimens of materials and building contrivances. We must, however, not omit to mention the numerous varied and beautiful designs of Mr. E. Prignot, the artist engaged by Messrs. Jackson & Graham. Several of them comprise designs in different styles, for the sides of apartments; and in one he has introduced, with accessories consistently combined in the Louis XVI. style, the elaborato sideboard made by Messrs. Jackson and Graham, which formed one of our illustrations of the French Exhibition.

*We have, however, got drawn away from the general drawings; though indeed amongst so large a collection, if we refer to any, we may omit others as deserving of notice. Amongst the designs for the Oxford Museum (a building now being erected in a somewhat questionable version of Gothic which has grown into favour of late); there are some which received premiums in the competition. Mr. E. M. Barry exhibits several different designs,—one of the chief of them being Gothic, and another Cinque-Cento Italian, whilst Messrs. Travis & Mangnall have chosen the style of the early Renaissance. Mr. I. Anson is the exhibitor of one of the designs for the Birmingham and Midland Institute, which is marked by much novelty of detail, and attention paid to grouping. Amongst the other competition designs, are some for the Taunton Assize Courts. Mr. Lamb's design has a portico well planned for effect. In the details great novelty has been attempted. Messrs. Prichard & Seddon's design, which is shown in a complete set of drawings, is in the Gothic style, and uses the open-timbered roof of the Westminster Hall class with excellent effect. Of the Westminster Hall roof a good outline drawing by Mr. Dollman is exhibited; and we may say that

of other drawings of old works, the Exhibition contains some interesting specimens.—There are several designs sent in competition for the Sheffield School of Art. In those by Messrs. Weightman, Hadfield, & Goldie, and that by Mr. G. R. Corson, a very marked effort is made to open out a new path, and in both cases with considerable success. In one of the designs by the former gentlemen, paintings were proposed for panels on the exterior; and colour generally plays an important part, both in these designs on the exteriors, and in others in the collection. Mr. Gray, this year as last, has made some successful applications of brick, stone, cement, and tiles combined in a general design, and there is much less of the tendency to ride a good idea somewhat hard, perhaps shown in his application of inlaid tiles, than formerly. His cornices exemplify a manner of using brick-work, which is perhaps even better than is to be discovered in the works of Mr. Kerr,—who has paid particular attention to the subject of brick architecture, and one of whose drawings has considerable merit.

However, the class of buildings in which the chief progress in architectural art has been exemplified, is not adequately illustrated; and the omission of such important works, as we could readily mention, of street architecture, both in the metropolis and the provincial towns, tends, we fear, to some misapprehension of the state of architectural taste. We have read some published critiques, which are indeed sad specimens of the incompetence on Art questions, still too often discoverable in ordinary journalism.

The chief exceptions to the deficiency in this department of the collection, are afforded by drawings of a few of the warehouses lately erected. Amongst the illustrations of Manchester warehouses, Mr. E. Walters's beautiful drawing is remarkable. It shows two or more of the works which have done so much to raise the character of the northern town in the scale of Art.—Mr. Godwin's farm-buildings near Bristol, we may say, exhibit many improvements, not only as to convenience, but in simple decorative design.

The interest with which we lately said we view the Exhibition, must not be judged of from the length of this notice. The collection displays, we repeat, much evidence of the hopeful condition which architecture as a living Art is attaining; it will, we trust, continue to excite a large amount of public interest; and if the opening could be arranged for a period of the year when town is full, and when the light is better for the minute examination which architectural drawings require, we could hardly attach too much importance to it as an educational agent. A large increase of space is however desirable—not merely for drawings, but for those numerous objects of Art which, as it is being perceived, have had no importance given to them under the régime of the Academy. We should also like the catalogue to be a model of arrangement and accuracy, and the “hanging” somewhat better for the purposes of study. The subjects of the lectures, also, should be less antiquarian; that is to say, the opportunity should be chosen for diffusing information as to what architecture is, and what objects it is calculated to effect,—subjects which have long been little comprehended by the public.

It will not, however, be supposed that we do not feel indebted to the committee for exertions under circumstances of no slight difficulty, and to which exertions it is not too much to say that the nation, as well as the profession of architects and other artists, may owe much. Mr. Ashpitel, the treasurer; Mr. Fergusson and Mr. Edmeston, the secretaries; and Mr. Wyatt Papworth, an active member of the committee, are especially entitled to thanks; and the duties which individuals have to undertake in these cases, are never easy, nor light. If hitherto we have afforded less space to the consideration of Architecture than the professors and lovers of the Art think we ought to devote, it has not been because we are insensible to its merits or its beauties, but because there are other journals which Architecture may claim exclusively as its own; we shall, however, report, from time to time, what we consider may promote its interests.

THE MILL AND THE STUDIO
OF REMBRANDT.

BY F. W. FAIRHOLT, F.S.A.

WITH ILLUSTRATIONS FROM ORIGINAL SKETCHES
BY THE AUTHOR.

ON the banks of the Rhine, between the villages of Layordorp and Koukergeren, there stood, at the end of the sixteenth century, a large, old-fashioned mill, on ground slightly elevated, and commanding a less monotonous view than Holland exhibits in general. It must not be understood, however, that the Rhine here exhibits any of those features of romance which give its banks so much attraction higher up the stream; its flat unvaried course partakes of the melancholy of extinction as it divides its water, and, losing itself in the marshy wastes of Holland, flows into the sea. Herman Gerritz van Rhyn was the owner of the mill, and on the 15th of December, 1606, the somewhat gloomy home he inhabited was rendered more joyous by the birth of a son who was destined to make the unknown name of his father immortal. The young Rembrandt van Rhyn appears to have been left to grow up in boyhood with a perfect freedom from all restraints, even of an educational kind. It is reported that he was schooled a little at Leyden, but it is evident that his attainments could never reflect back any honour upon that seat of learning. Application of such a kind was never to Rembrandt's taste, and historic research, even when necessary for the *vraisemblance* of his designs, he openly and avowedly despised. How soon his taste for Art developed itself we do not now know, but it is very likely to have been exceedingly early, and the gloomy shade or vivid sunshine which alternated in his father's mill, may have impressed his youthful imagination most strongly at a time when the mind is most open to powerful impressions. His early days must have passed somewhat monotonously in his home, which by his own representation had few attractive features.* The mill itself seems to be situated over the favourite ditch of a Hollander, which stagnates close by the house, a square, gloomy building, with heavy dormer windows, the roof partly overgrown with the rank herbage and parasitical plants of a damp climate. It seems the very realisation of Tennyson's "moated grange;" like that,

"The broken sheds look sad and strange,
Weeded and worn the ancient thatch."

You can detect the marshy moss which "thickly crusted all," while the "sluice with blackened waters" is near, and the distant prospect is but

"The level waste, the rounding grey."

A boy born here, to have become an artist, must have been gifted at birth with a genius for Art, and his visible powers for practising it must have been strong to have induced his parents, who appear to have cared little for his mental cultivation, to obtain instruction for their son of its professors. They were not wealthy, and, consequently, could not obtain the best assistance; four mediocre professors of painting are named by Smith in his memoir of Rembrandt as his instructors.† But the very brief period he remained with each, and the small assistance they could have been to him, except as instructors in its simplest rudiments, is evident from an acquaintance with their works and his own. He soon left them all, and practised what he knew in his paternal home; with his taste for *chiar-oscuro* there can be little doubt that the strong opposition of light and shade constantly before him in the gloomy mill, where his father pursued his avocations, gave him the first hint of the hitherto undeveloped power he possessed, and which he "subsequently carried to such high perfection in his works, that he may be said to have created a new era in painting."‡ Through life he seems to have always worked as if he had the effect of a small amount of con-

* The etching of his father's house and mill, which is here copied, is dated 1641, and was consequently done by the painter when he was thirty-five years of age.

† Prefixed to his complete and excellent "Catalogue Raisonné" of his works.

‡ Ibid.

centrated light before him, and as if every object he portrayed was more or less subjected to that medium only. Burnet, in his "Lectures on Painting," has admirably dissected this principle, as original as it is inapproachable; "in real truth," says Kugler, § "he struggled to give vent to a rude defiance of all conventional excellence, and in the fulfilment of this task he has, indeed, produced extraordinary effects. He gives no sharply-defined forms, but merely indicates

them with a bold and vigorous brush; the principal points alone are made bright and prominent by striking lights, but at the same time the lights reflected from them penetrate in a wonderful manner the surrounding darkness, to which they thus give life and warmth."

He appears to have reached the age of manhood ere he left his father's roof, and to have had the mill and its neighbourhood for his studio, and the boors who lived near for his

REMBRANDT'S MILL.

companions. He never lost his early tastes, and seems to have loved, in more prosperous days, to revert to the lower companionships of his youth. When rallied on this taste in after-life, he honestly owned the little relief he found in high society, or the envied *entrée* he could command to the houses of the *élite* of Amsterdam, saying, "If I wish to relax from study, it is not honour, but liberty and ease that I prefer."

How admirably has a great living artist || vin-

icated and displayed the true position he occupied. "Men of great and original genius, who, like Rembrandt, have little of what is ordinarily called education, and who seem wayward in their tastes and habits, are sometimes looked upon as inspired idiots. But in the mind of such a man, the immense amount of knowledge accumulated by great and silent observation, knowledge of a kind not to be communicated by words, is something wholly inconceiv-

SIX'S BRIDGE.

able to the learned merely in books; and if their reading has opened to them a world from which he is shut out, he also lives in a world of his own, equally interesting, the wisdom and enjoyment of which his pencil is constantly employed in communicating to all who have eyes for the sublime aspects of nature, and

hearts fitted to receive such impressions through their eyes."

That Rembrandt was thus diligently and usefully studying is evident from the rapidity of hand, and power of expression he possessed in after-life. His vigour was untiring, and his industry unbounded. We possess, in Smith's "Catalogue Raisonné," a detailed account of 614 pictures by him, and he assures us, that "a list of drawings of perhaps triple the number might

§ "Handbook of Painting," Part ii.

|| Leslie, in his "Handbook for Young Painters."

be made from the public and private collections in England, France, and Holland;" then add to these his etchings, consisting of 365 pieces, exclusive of the numerous examples of variations in the same plates, and we have an astonishing picture of his powers and industry.

His extraordinary facility of hand is evident in all his works; there is an amusing record of its power in one particular instance, which deserves notice. The painter had gone to pass a day's holiday with his friend Jan Six, the Burgomaster of Amsterdam, at his country house.* The time for dinner had arrived; it was served; but when they had sat down to table, the thoughtless servant had forgotten to obtain any mustard; he was despatched in a hurry to the village close by to obtain it, but Rembrandt, fully aware that to hurry is no characteristic of a Dutch servant, at once wagered with his friend that he would etch the view from the window of the dining-room before he returned. The painter had always some plates ready prepared for occasional use at his friend's house, so he took up one, and rapidly sketched upon it the simple view before him, completing it before the domestic returned. Our engraving is a faithful copy of this etching, about one-third of the size of the original; it is dated 1645, and represents the most simple elements of an ordinary Dutch view, a bridge, a canal, a low, level horizon, a village among trees, with a boat half-hidden in the canal beyond. The mark may yet be seen in the original impressions of this rare plate, where Rembrandt tried his etching-point before commencing his work, which is executed with the greatest freedom of hand, so that a few lines only express the trees and boats, and a few decisive shadows give solidity and effect to the scene. There is nothing in the etching to dissipate any faith in the tale of its origin, and it is popularly known as "Six's Bridge," or "The Mustard-pot."†

At this time the artist was located in Amsterdam; his first recognition as a painter was at the Hague, in 1627, where he had journeyed to sell a picture to an amateur, who astonished him with a payment of 100 florins (*St. Gs. 8d. English*) for it. Houbraken, who relates the story, tells of the joy of the young artist, who travelled from his father's house on foot to his patron, a distance of about 10 miles, but was too eager to acquaint his parents with his good fortune to return by the same mode; he therefore mounted the diligence, and when it arrived at Leyden, jumped from the carriage and ran home as quickly as his legs could carry him. In the year following he took up his abode in Amsterdam, and (with the exception of a voyage to Venice, which it is conjectured by some of his biographers he may have taken about 1635‡) never left the important capital of Holland.

Amsterdam has been aptly styled a "Dutch Venice;" it is permeated with canals, and founded in the water. It is, perhaps, the most artificial site in the world for a city; being, in fact, nothing but bog and loose sand, and every inch of foundation for human habitation or use, has to be made by driving wooden piles through this into the firmer sand below; each pile is formed of a large tree, 40 or 50 feet in length, and it is recorded that upwards of 13,000 were used for the foundations of the town-house alone. This may give an idea of the expense of building in the city, and the enormous quantity of timber upon which it is constructed, which led Erasmus to jocularly say of its inhabitants, that they, like

crows, lived on the tops of trees. The distant view of the town from the Y§ side is very curious, with its tall houses mixed with shipping, some mansions bending portentously forwards, others sinking sideways or backwards, and all showing the insecure nature of their foundations.¶ But the most curious feature in the view is the myriad of windmills mounted on the fortifications on the land side of the town. There are thirty bastions now useless, and upon each of these works windmills are erected, the odd effect of the number of their sails rapidly whirl-

ing in the breeze, is a peculiarity as unique as the city itself.¶ These fortifications now make an agreeable promenade for the inhabitants, the city being built in the shape of a crescent from the water's edge. It is nearly seven miles in circumference, and consists of 95 islands, formed by stacks of houses, to which access is gained by 290 bridges. On the quays are many noble houses, the erections of the rich and powerful merchantmen who, in the palmy days of the city, flourished here. The best bear dates of the days of Rembrandt, and testify to the wealth

DISTANT VIEW OF AMSTERDAM.

and taste of their inhabitants. There is a solid dignity and a well-understood comfort about these old houses, very characteristic of that strong domestic attachment which the Dutch so passionately feel. In their love for the substantial they even exceed the English, and the ponderous character of the carved staircases and panelled rooms would more than satisfy the objections of the veriest "John Bull" to flimsiness of construction. Everything seems made as much for posterity as for personal use; and

in walking over the town, you see that two centuries have passed over its buildings, though located in the dampest position, with scarcely a "defeature" from time, and that they may well last two more. There seems no desire for change in a Hollander; that which is substantial and useful is enough for his requirements, and no idea of modern improvement seems to be sufficient inducement for the trouble of alteration. In walking through the best street of Amsterdam (the Kalverstrasse) you see nothing but the

ST. ANTHONY'S GATE, AMSTERDAM.

quiet red brick houses, with their "erow-step" gables, that we have been familiar with from childhood in the pictures by native artists; or

the heavy wooden shop-fronts, with their ponderous frames, and small squares of glass, much like the old London shops in the prints of the time of William and Mary. One spirited individual has recently built a showy shop here,

* The *chef-d'œuvre* in our National Gallery, the cabinet picture, "The Woman taken in Adultery," was painted for the Burgomaster Six, and preserved with scrupulous care by the family until the great revolution at the end of the last century, when it was sold to a French dealer, who again sold it to Angerstein for 5000*l*.

† This very rare etching sold in the Verstolk sale at Amsterdam, in 1844, for 17*l*. 15*s*., and would now fetch considerably more, as the value of Rembrandt's etchings has increased yearly.

‡ The conjecture is founded solely on the fact of three etchings of oriental heads, bearing the inscription "Rembrandt Venitiis." But this, as Smith observes, "may have been a mere caprice of the master," or a jest in connection with his subjects or their treatment, or else a satire on the taste which would prefer the more ambitious school of Italian Art to his own; a feeling fully in accordance with Rembrandt's expressed opinion on other occasions. There is no other indication than this of foreign travel in his life or works.

§ The Y or A is an arm of the Zuider Zee, which forms the port, and this syllable, or letter, resembles in sound the word used in Holland for water: *het Y*, the term by which it is usually known, means nothing more than "the water."

¶ In 1822, the enormous corn-warehouses used by the East India Company, loaded with 70,000 cwt. of corn, sank down into the muddy foundation, from the subsidence of the wooden substructure. The old Exchange has also sunk, and been demolished.

¶ Our view is sketched from the borders of the great ship canal, opposite the city, and shows the old church, the quay, and bastions. The boat drawn by a horse is the *treckschuyt*, or travelling boat, used by passengers on canals, consisting of a low covered saloon built in a broad barge, with an open railed platform above, to which passengers may ascend in fine weather. It is the most popular mode of conveyance.

light and airy, *à la Paris*; but it seems to be looked upon as a folly, rather than a want, by the inhabitants.

One of the oldest and most picturesque buildings in the city, of a public nature, is the Weighing House, situated near the Museum, and the house where Rembrandt lived. It was originally a gate, before the town had increased to its pre-

sent unwieldy proportions, and was known as the Gate of St. Anthony. It is said to have been erected in the latter part of the fifteenth century, and to have played its part in the wars between the inhabitants and their vindictive Spanish rulers. It is a quaint solid old building, and some few years since was used as a medical school, after its desertion by the merchantmen.

REMBRANDT'S HOUSE.

In the open space in front the scaffold used to be erected for criminals, and others for spectators around it; the burghers at one time firmly believing such spectacles had their uses in deterring evil-doing: hence, their families and dependants were compelled to attend these horrible "salutary warnings," as a great moral lesson.

Rembrandt's industry was untiring, as we have shown, and appears to have been so far rewarded with success, that he took a large house in the Blomgracht, and fitted it up for the reception of pupils. He had married the daughter of a farmer, named Uylenburg, living at the village of Ransdorp,† in the swampy district opposite the city, appropriately called

L. J. G. W. 163
Aut. Rembrandt
Rembrandt

AUTOGRAPH OF REMBRANDT.

Waterland.* His pupils, according to Sandrart, brought him an income of 2,500 florins per year, as he received 100 florins from each for that period. His paintings, drawings, and etchings

* By this marriage he had a son, Titus van Rhyen, who, educated for Art, never succeeded beyond copying his father's works, and died in obscurity.—Smith.

must have also realised considerable sums. From 1640 to 1650 appears to be the culminating point of his genius and his fortune.

Rembrandt's misfortunes commenced with the purchase of the house delineated in our

† The scenery of this village, and the old tower in its centre, were etched by the painter in 1650.

engraving.‡ It was situated in what was then known as St. Anthony's Bree Street, and which is now called the Jews' quarter. It was a large handsome mansion with garden attached, and was freehold. The artist appears not to have been enabled to purchase it without borrowing the sum of 4180 guilders, which was advanced on mortgage; and being soon after unable to meet his engagements, his entire effects were seized and sold by order of the magistrates, in July, 1656. The homeless painter was obliged to lodge where he could, and make a charge for his necessary maintenance to the bankruptcy court. He was but fifty years of age when this happened, but he did not long outlive his altered position, for he is believed to have died in 1664, as his son Titus received the balance from the same court of 6952 guilders (upwards of 600*l.* English) in the following year, which was paid over to him as a balance of accounts after all claims, including heavy law expenses, had been paid out of his father's property.

From this it appears that Rembrandt, like many other unfortunate persons, was a victim to law and lawyers; and added another to the long list of men of genius who are fed on by the intellectual harpies around them, but who are still ever ready to sneer at the want of business habits displayed by their prey—a sneer too frequently repeated by the wealthier ignorant, always glad to drag genius down to their own low level. The parsimony attributed to Rembrandt is not unusual with his countrymen in general; and the stories of his dining off a herring, or a slice of bread and cheese, need excite no wonder in a land where all practise thrift. The fac-simile of his autograph we engrave is from a letter to the great Huygens, written on a piece of paper which had been previously used to fold round a copper-plate; but with the artist's little love of trouble, we may account for that by other than parsimonious reasons.§ The tales so readily told of the painter's parsimony, and his unworthy tricks in accumulating money, are almost disproved by the melancholy close of his life. Still, at one period he must have earned much. Smith, his best biographer, is inclined to infer that his difficulties resulted from indiscreet conduct in the management of his affairs. Another easy mode of accounting for much loss of cash, is in the suggestion also thrown out in the same work, that the painter's intimacy with Manasseh Ben Israel and Ephraim Bonus may have tempted him to part with his money for alchemical pursuits, as both those persons were addicted to cabalistic studies, and the former wrote a book on the subject, for which the artist etched four plates remarkable for mysticism. The etching of Faustus in his study, gazing on the mystic *pentapla*, which irradiates his gloomy chamber, gives us the best realisation extant of the cabalistic belief of the occult philosophers, and proves how far the artist had studied and was familiar with the dreamy science.

Rembrandt's scholars were many; but his power of *chiar'-oscuro* did not descend to any of them. Among them were Gerard Dow, Nicholas Maes, and Ferdinand Bol, all excellent in their way, but characterised by few peculiarities like those seen in the works of their early preceptor. Rembrandt cared little for historic proprieties.

The originality and peculiarity of Rembrandt's genius has left him undisputed master of his own walk in Art. It would be impossible to improve his faults without injuring his productions. By the magic of his hand he has at times elevated low and disgusting forms into covetable marvels of light and shade; the grand management of pictorial effect is always present, while at times the conception of each picture in its totality is unrivalled in Art.

‡ It is copied from a print published in Smith's "Catalogue Raisonné," from a sketch by Mr. Albertus Brondgeest, made before the house was destroyed in 1831; the same gentleman caused a black marble tablet, on which the name of Rembrandt is inscribed, to be inserted at his expense in front of the new one erected on the site. It is situated at the back of the museum, the gardens and outbuildings of both joining.

§ Autographs of Rembrandt are very rare; four letters in Sloepken's collection, sold in London for 3*l.* 1*s.*; the above was in the Donnadieu sale.

THE
PROGRESS OF ART-MANUFACTURES.

NOVELTY seems to be as much the aim of the manufacturers of the present day as any other quality in the objects they produce: we speak

not of novelty in design only, though this is carried to a considerable extent, and often to a point beyond its legitimate principles—but also in the introduction of new materials, or in a combination of those long in use. The taste of the public appears occasionally to require this kind of enticement; and yet it has become so

fastidious, or, rather, it is assuming so right a direction, that novelty alone will not command success.

Though the excitement caused by the great universal exhibitions of 1851 and 1855 has now passed away, there is little fear that the manufacturers of our own country, any more than those of France, will rest upon their oars;

neither we nor they can afford to do this, for each has been stirred up to a rivalry in the art of production which ought to, and we doubt not will, result in good to all. And, inasmuch as we claim to have had some small share in creating these national competitions, it is not our intention to separate ourselves from those whose interests we have advocated to the best of our ability, even although there is now less occasion

for our interference than there was a few years back. We have felt that the Industrial Arts of Great Britain had a claim upon us, and that while endeavouring to promote their progress, and to direct the tastes of the

producer and consumer, we were conferring a mutual benefit on both: we feel this still, and shall therefore continue, at suitable intervals, to report whatever may seem worthy of a place in our columns.

In pursuing this plan, we have engraved on this page several objects selected from the establishment of Messrs. ATKIN, BROTHERS, of Sheffield and London.

They are examples of that novelty in material of which we have just spoken, the frame-work being composed of electro-plate, and the centres of tiles—manufactured by Messrs. Copeland & Co.—richly ornamented, and highly glazed to prevent their being scratched. The objects themselves consist of baskets for fruit, cakes, or cards; stands for tea-pots,

urns, kettles, or lamps. They are made in a large variety of patterns, sizes, and colours, some of the tiles having a white ground, and others coloured, as seen in the engravings: the best decorative artists are employed on the ornamentation. The novelty and beauty of these metallo-ceramic productions cannot fail to secure them popularity.

THE SLEEPING CHILDREN.

FROM THE GROUP BY W. GEEFS IN THE
COLLECTION OF THE QUEEN.

M. GEEFS would seem in this work to have taken a leaf out of the book of Chantrey; it is highly probable the Belgian sculptor has never seen the exquisite group by our countryman erected in Lichfield Cathedral to the memory of the young children of the late Reverend W. Robinson; possibly has never even heard of it: there is not, moreover, such a manifest similarity between the two works as to suggest the idea of plagiarism, and yet a glance of the more recent piece of sculpture involuntarily recalls the older group to recollection. The position of the children in both is nearly the same, the arms and heads are disposed alike, both groups are lying on mattresses, but Chantrey's figures are stretched at full length, indicating an entire suspension of animation, while these by Geefs are living, though motionless, and are not extended as the others; Chantrey's, moreover, are draped. Death, peaceful, profound, holy, is the attribute which pervades the one group; life, fresh, innocent, lovely, characterises the other.

A work of this nature is a novelty from the hand of a foreign sculptor; it proves that a feeling for subjects of a domestic character, such as have hitherto seemed indigenous to our own soil, are beginning to find a home elsewhere. We believe that this kind of art, though usually, and wrongly, we presume to say, rejected by the learned as high art, has a most beneficial tendency upon the minds of the majority of the public; it elevates and purifies the thoughts by the moral lessons inculcated. The highest state of civilisation, and the greatest excellence to which the arts can attain, are not of themselves sufficient to create a standard of morality and right principles. Greece, when at the pinnacle of her intellectual and artistic greatness, showed how utterly futile were such advantages in themselves to preserve her from moral degradation; the statues of her deities and her courtesans stood side by side at Delphi. Personal beauty, both in their male and female forms, was what the Greek sculptors aimed at,—it was in their estimation the highest merit; as it was a maxim of policy and philosophy among the Greeks, generally, to present to the eyes nothing but models of the beautiful.

Admitting the law of beauty to be a primary condition of all art, but especially of the art of sculpture, that of purity of sentiment and expression has an equal, if not prior claim, on the artist's conceptions. We may, perhaps, incur ridicule for subordinating these qualities to that in which the ancients delighted; but we are not the less certain that their combined existence is essential to the true dignity of art, and that such a combination can alone render it acceptable in our age of the world. Even among those continental nations who have been less lax in their ideas than ourselves, this feeling is now everywhere manifesting itself.

The group of "Sleeping Children," by W. Geefs, of Antwerp, the sculptor of the "Lion in Love," engraved in the *Art-Journal* last year, is in the Royal Collection at Osborne, and was, we believe, executed in marble, by command of her Majesty, from a plaster model that the Queen had admired. It is one of those subjects that never fail to please, and is executed in a manner which leaves little or nothing to be desired. The attitudes of the figures are perfectly natural, the forms well-modelled, the faces truthful, childlike, and sweet in expression; the heads, especially that of the nearer child, would, perhaps, have been better if rather smaller: we remark that sculptors often fall into the error of exaggeration in the heads of young children.

J.H. BAKER, SCULPT

THE SLEEPING CHILDREN

FROM THE GROUP BY GEEFS, IN THE COLLECTION OF THE QUEEN.

ART IN THE PROVINCES.

BIRMINGHAM.—The Exhibition of the Society of Artists closed on the 12th of January, after a very successful season, as regards both sales and attendance. During the fortnight that the collection was opened to the working classes, it was visited by no fewer than nine thousand persons; and the sales of pictures, according to the catalogue prices, amount to no less a sum than 2,457. 19s. The following is a list of the private sales made during the season:—'Blind Man's Buff,' J. E. WALKER, 120*l.*; 'The Dairymaid,' W. UNDERHILL, 100*l.*; 'Master Walter Scott and his Friend Sandy Ormiston,' J. E. LAUDER, R.S.A., 81*l.*; 'Devotion,' A. JOHNSON, 73*l.* 10s.; 'The Charge of the Heavy Cavalry Brigade at Balaklava,' H. SELOUS, 63*l.*; 'An Old Mill on the River Ouse,' H. J. BODDINGTON, 60*l.*; 'The Gulf of Sorrento,' J. B. PYNE, 50*l.*; 'On the Trent,' J. WARD, 50*l.*; 'Cactus,' MISS MOUTRIE, 42*l.*; 'The Youthful Fowlers,' E. WALTON, 31*l.* 10s.; 'Hollyhocks,' MISS MOUTRIE, 26*l.* 5s.; 'Grassmere,' G. W. PETTIT, 25*l.*; 'Sunny Hours,' F. BRIDGFORD, R.I.A., 21*l.*; 'The Keeper's Home,' G. W. HORLOR, 21*l.*; 'Mother's Pet,' G. W. HORLOR, 21*l.*; 'Secret and Confidential,' R. FARRIER, 21*l.*; 'On the Irwell, Barton Lock,' E. HARGITT, 20*l.*; 'The Little Mischief Maker,' J. COBLEY, 18*l.*; 'The Woodland Spring,' A. BOUVIER, 17*l.*; 'Queen Elizabeth's Room at Coombe Abbey,' A. E. EVERITT, 15*l.* 15s.; 'Scene near Dove Dale,' W. B. HENLEY, 15*l.* 15s.; 'Snowballs,' J. A. PULLEN, 15*l.* 15s.; 'Near Conway,' W. PITT, 15*l.*; 'Romp on the Hay,' J. BOUVIER, 12*l.* 12s.; 'Brace of Pheasants,' G. G. BULLOCK, 12*l.* 12s.; 'A Dispute Arranged,' J. LEVACK, 12*l.* 12s.; 'A Welsh Bridge,' H. MYTON, 10*l.* 10s.; 'Rydal Water,' A. P. COLLIS, 10*l.*; 'Buttermere,' G. W. PETTIT, 10*l.*; 'Near Manchester,' E. HARGITT, 8*l.*; 'Dittisham on the Dart,' W. PITT, 8*l.*; 'The Farm Yard,' J. STEWART, 7*l.* 7s.; 'Near Hampton,' S. H. BAKER, 5*l.* 5s.; 'At Lanhangel,' S. H. BAKER, 5*l.* 5s.; 'Near Temple Balsall,' S. H. BAKER, 5*l.* 5s.; 'A Shallow Stream,' T. EDWARDS, 5*l.* 5s.; 'A Soldier's Wife,' K. HARTMANN, 5*l.* 5s.; 'Tummel Bridge,' J. ALLSON, 5*l.* 5s.; 'A Friend in Need,' S. EGLINTON, 5*l.* 5s.; 'A Study from Nature,' P. DEAKIN, 5*l.*; 'Windsor,' J. J. LUGHER, 5*l.*; 'Banks of the Isis,' A. VICKERS, 4*l.* 4s.; 'Avenue at Bolton Abbey,' A. VICKERS, 4*l.* 4s.; 'Marguerite,' J. BOUVIER, 4*l.* 4s.; 'Still Life,' J. T. HART, 4*l.*; 'Head of a Hindoo,' J. SCARBOROUGH, 3*l.* 10s.; 'Stray Ducks,' C. WRIGHT, 3*l.* 3s. The following is a list of the purchases made for the Glasgow Art-Union:—'Summer Trophies,' J. SANT, 130*l.* 10s.; 'Capercailzie, Ptarmigan, and Grouse,' G. W. HORLOR, 130*l.*; 'View in North Wales,' J. C. WARD, 80*l.*; 'Red Tarn, Helvellyn,' G. W. PETTIT, 70*l.*; 'The Edge of the Wood,' F. H. HENSLAW, 60*l.*; 'Rustic Figures,' J. J. HILL, 36*l.* 15s.; 'A Thought from Boccaccio,' A. J. WOOLMER, 36*l.* 15s.; 'The Margin of Ennerdale Water,' G. W. PETTIT, 30*l.*; 'A Path through the Woods,' H. J. BODDINGTON, 25*l.*; 'Lowestoft Harbour from the Sea,' J. CALLOW, 15*l.* 15s.; 'A Rest on the Road Home,' E. J. COBBETT, 15*l.* 15s.; 'Llanbistre Church,' S. H. BAKER, 15*l.* 15s.; 'Old Buildings at Bermondsey,' H. HARRIS, 15*l.*; 'A Shady Lane,' P. DEAKIN, 15*l.*; 'A Study on the Rhine,' W. CALLOW, 12*l.* 12s.; 'Venice,' E. PRITCHETT, 12*l.* 12s.; 'Lamb at Play,' J. DEARMAN, 12*l.* 12s.; 'Derwent Water,' G. W. PETTIT, 10*l.*; 'A Scene at Chilworth, Surrey,' J. DEARMAN, 6*l.* 6s.; 'View in North Wales,' J. C. WARD, 6*l.*; 'An Old Water Mill, North Wales,' J. J. WILSON, 5*l.* 5s.; 'Water Mill, Bettws-y-Coed,' P. DEAKIN, 5*l.*; 'An Old Foot Bridge, near Solihull,' F. W. HUMPHRIES, 5*l.* The works taken by prizeholders in the Birmingham and Midland Counties Art-Union—three of whom have made no selection, were:—'The School-fellows,' A. RANKLEY, 157*l.* 10s.; 'Gipsy Encampment,' C. T. BURT, 60*l.*; 'A Rustic Cottage,' H. HARRIS, 40*l.*; 'Near Talyllyn,' W. HALL, 35*l.*; 'Approaching Rain,' C. T. BURT, 30*l.*; 'The Fisherman's Home,' T. CLATER, 26*l.* 5s.; 'Raglan Castle,' W. PITT, 25*l.*; 'The Farewell,' C. HARTMANN, 21*l.*; 'A Passing Cloud,' T. EDWARDS, 20*l.*; 'The Youthful Artist,' W. T. RODEN, 20*l.*; 'Study of a Head,' W. GALE, 20*l.*; 'A Pedlar Boy,' O. OAKLEY, 18*l.* 18s.; 'Instruction,' J. RYLEY, 15*l.* 15s.; 'Cottage Hospitality,' O. OAKLEY, 15*l.* 15s.; 'Banks of the Lugwy,' F. W. HULME, 15*l.*; 'A Fortune Teller,' O. OAKLEY, 12*l.* 12s.; 'Cattle, Milking Time,' J. H. SMITH, 12*l.* 12s.; 'A Child's Prayer,' D. G. BLAKISTON, 10*l.* 10s.; 'A Mallard, &c.,' G. HICKIN, 10*l.*; 'Gossip in the Plough Field,' J. J. HUGHES, 10*l.*; 'Old Castle on the Rhine,' Mrs. OLIVER, 7*l.* 7s.; 'A Ruined Mill,' F. W. HUMPHRIES, 5*l.* 5s.; 'Windsor,' A. VICKERS, 5*l.* 5s.; 'Birmingham from Sutton,' W. B. HEN-

LEY, 5*l.* 5s.; 'Mill in Vale Crucis,' W. ELLIS, 5*l.* 5s.; 'The Evening Drink,' J. HAWKES, 5*l.* The subscribers to the Birmingham and Midland Counties Art-Union met at the commencement of the past month for the purpose of receiving the annual report, and of balloting for the prizes. Notwithstanding the commercial difficulties of the past year, and the increase of national taxation, the subscriptions have increased, though even now they scarcely reach the amount one would expect to see from a locality so populous and wealthy as that of the iron districts; the total being 409*l.* 10s. only. In the ballot for prizes, the two highest, that of 50*l.* fell to the lot of Mr. H. Dawson, of Chertsey; and that of 30*l.* to Mr. W. B. Jennens, of Birmingham. Lord Ward has accepted the office of President of the Society for the ensuing year.

GLASGOW.—The Second Annual General Meeting of the members of the "City of Glasgow Fine Art Association" took place on the 5th of January. The report of the secretary is as follows:—"The council have the pleasure of reporting to the association at their second annual meeting that, like the progress of good taste itself, which is certain and irresistible, the association this year exhibits the encouraging enlargement which the first annual report anticipated. The subscribers for 1854 numbered 687; for 1855, the list contains about 1400 names. In 1854 thirty-five paintings were acquired by the subscribers; for 1855 the number to be distributed is forty-seven. The paintings to be now drawn for were exhibited in the St. Vincent Street Fine Art Gallery, and were visited and admired by large numbers of persons. They were considered by well-known connoisseurs of our city to be an extremely well-selected exhibition of modern art. It was intended to have them on the walls of the room in which the annual meeting is held, but the Merchants' Hall being the only available place of meeting, the council have not been able to carry out this intention. The experience of the past two years is evidence that the association has taken root, and in its growth shows features of vigour closely resembling the other Art-Union of the country, which have, each, slowly perhaps, but surely, attained a magnitude that now exercises a most genial influence upon the Fine Arts in Great Britain. The object of this association is to promote the knowledge and love of the Fine Arts, and their general advancement, by an extensive distribution of the works of living artists—to elevate the standard of Art and its professors, by creating an increased desire and demand for works of Art, and a consequent improved taste on the part of the public. The council think it is not assuming too much, therefore, to say that a position has been attained by the association, which must already have exerted a very important influence; or to express the confident hope that, by its continued rapid growth, the association will ere long exercise an incalculably greater influence on the advancement of the Fine Arts. While they have every reason to be satisfied with the arrangements and progressive improvement of the past year, the council, in order to give the association the advantages enjoyed by the older Art-Unions, have resolved in future to present to each subscriber an engraving, or other specimen of Art in connection with the works exhibited. This resolution is a departure from what was originally intended to be a distinctive feature of this association from other Art-Unions, viz., that the whole funds were to be expended on works for distribution; but the alteration is made in compliance with the general wish of the public; and it is proposed accordingly that each member next year shall receive an engraving or finely-executed lithograph from the picture 'Margaret at her Spinning-Wheel,' by H. O'Neil, one of the present year's prizes. The prize-holder of this admirable cabinet painting will be bound to leave it for a few months with the association. This is the present intention of the council, who wish, however, to reserve the power of selecting a different painting if it seem advisable."

WORCESTER.—The exhibition of the Worcester Society of Arts has proved a prosperous one, considering the infancy of the institution, and the peculiarly unfavourableness of the times for the disposal of luxuries of every kind. Since our last report, in December, pictures to the value of between 400*l.* and 500*l.* have been purchased; the committee of the Glasgow Art-Union having bought liberally, yet with discretion. The entire proceeds of the sale to the time of closing amounted to nearly 700*l.* The following list of pictures sold may be added to that we previously published:—"A Forest Brook," J. STARK, 50*l.*; 'Fishing-Boats, Dublin Bay,' E. HAYES, A.R.H.A., 17*l.* 17s.; 'A Woodland Pool,' B. WILLIAMS, 26*l.* 5s.; 'Shall I Tell your Fortune?' J. CURNOCK, 26*l.* 5s.; 'Neapolitan Pea-

sants,' J. BOUVIER, 8*l.*; 'The Corn-Flower,' BELL SMITH, 15*l.*; 'Sketch on Hampstead Heath,' C. COMPTON, 5*l.* 5s.; 'The Inattentive Scholar,' J. BOUVIER, 5*l.*; 'Mariana,' U. BOUVIER, 6*l.* 6s.; 'Geraniums,' MISS C. HARCADALE, 5*l.* 5s.; 'The Game Boy,' J. STARK, 8*l.*; 'Entrance to Canterbury,' J. HENSHALL, 20*l.*; 'Study of Salmon, &c.,' H. L. ROLFE, 21*l.*; 'Borders of Derbyshire and Staffordshire,' J. PEEL, 20*l.*; 'Water-Mill, Llan-tisilio,' A. DEAKIN, 4*l.* 4s.; 'Morning, North Wales,' G. TRAVERS, 10*l.*; 'Snowing,' G. A. WILLIAMS, 20*l.*; 'Scotch Terriers,' T. EARL, 21*l.*; 'Dead Game,' J. HARDY, JUN., 10*l.*; 'Approach to Market-Place, Lichfield,' J. HENSHALL, 5*l.*; 'Moel Siabod, Denbighshire,' F. H. HENSLAW, 10*l.* 10s.; 'A Nook in a Garden,' H. CHAPLIN, 8*l.* 8s.; 'Meadow Scene, near Leamington,' T. BAKER, 10*l.* 10s.; 'Paul Shrimping-Boats entering Hedor Haven,' R. STUBBS, 6*l.* 6s.; 'River Thames, near Greenwich,' H. HARRIS, 10*l.* 10s.; 'The Donkey Ride,' N. E. GREEN, 3*l.* 3s.; 'Derwent-water,' N. E. GREEN, 5*l.* 5s.; 'The Rainbow,' J. SIMMONS, 21*l.*; 'The Blind Father,' KARL HARTMANN, 21*l.*; 'Venice,' E. PRITCHETT, 8*l.* 8s.; 'Joe G. Ruiner,' E. DAVIS, 6*l.* 6s.; 'A Showery Day,' G. A. WILLIAMS, 10*l.*; 'Calm Morning, Coast of Shoreham,' B. WILLIAMS, 8*l.* 8s.

MANCHESTER.—We find that the recent Exhibition of Modern Works of Art opened to the public on Wednesday, September 12th, 1855, and that it closed, after a season of seventeen weeks, on January 5th, 1856. During this time there were 88 Day Exhibitions, at 1s. admittance; 11 ditto, at 6*d.*; 53 ditto, at 2*d.*; the number of evening visitors being as follows:—5685 at 1s; 1639 at 6*d.*; 31,340 at 2*d.* It will thus be seen that the success of the copper, taking into consideration the relative number of exhibitions, beat the silver tickets, to an extent which even the most sanguine would have scarcely anticipated. The number of pictures sold in the room throughout the season was 71, value 1465*l.*; of which the Glasgow Art-Union bought 14, value 390*l.*; and the Manchester Art-Union 16, value 310*l.* "The advantage in favour of a liberal system," says a local journal, "is again remarkably manifested on the days when the charge was sixpence, as opposed to the shilling. Taking into consideration the relative number of days on which each were open, it will be found that the sixpence produces as much as the shilling, whilst it gratifies twice as many people. Nor should it be overlooked that the reduced charges were not brought into play until the gallery had been open for several weeks, and consequently when the novelty of the exhibition—at all times an important consideration in any appeal to the public—had passed away. These numbers are exclusive of the governors and the privileged members of their families, who have free admission at all times; also exclusive of free admission given to the drawing-classes of the Mechanics' Institution, the pupils of the School of Art, and a number of Sunday-school children, admitted at a trifling charge."—Manchester proposes to erect a statue of the inventor of the steam-engine, James Watt. A subscription has been started to defray the expenses of having one executed from that in Westminster Abbey by Chantrey: it is to accompany those of Wellington, Peel, and Dalton, which now stand in front of the Infirmary. We should have thought a memorial of Watt would have had precedence, in Manchester, of these other worthies, for the steam-engine has proved a mine of wealth in that city; and while the manufacturers should not honour Wellington, Peel, and Dalton less, they ought to honour Watt more.

BELFAST.—The Government School of Art in this town will, it is reported, be re-opened about the beginning of the present month; but there is not, as we understand, any truth in the statements made in the *Times*, a few weeks back, that the government had restored the annual grant of 600*l.*, which was taken away from the School some time ago. The only assistance now rendered to this or other similar institutions is a minimum guaranteed salary to the master for the first year, provided the half fees received in the central school, and all the fees paid to the master for parochial teaching, together with the value of his certificate (10*l.* for each), do not reach the sum specified; (in the case of the master of this school, it amounts, we believe, to 150*l.*) in such case, the deficiency will be made up by the Board of Trade. The injustice of this measure is, that while masters on the old foundation still receive a guaranteed salary equal to their former allowance, without being required to pass any examination, or undergo any additional training at Marlborough House, *certificated teachers*, who are expected to be qualified for the same duties, are only entitled to the value of their certificates, with half the pupils' fees, as before mentioned, and to a guaranteed salary for one year,

which usually is only the amount of 70%. It is not therefore to be wondered at, that local committees should distrust the talent and ability of a master who is willing to undertake the responsible duties of his office on such terms; and hence the reason why so few localities avail themselves of the advantages offered by the Department. The government grant to the Belfast School was, as we have observed, 600*l.*—certainly a liberal assistance; but not too liberal for a school in a large and populous locality when first established. But we are of opinion, and we have expressed the same before on more than one occasion, that large and flourishing towns ought mainly to support their own schools, and not rely upon extraneous aid. The place in which the school is opened, alone, or almost alone, is benefited by the institution; and if the inhabitants are not disposed to make the necessary sacrifices for its support, they have no right to expect the public at large, through the government, should help them, except to a certain extent. The principle contended for by the Board of Trade, that of self-support, is just; and we are satisfied it might be carried out if it were met in a liberal spirit, such as should actuate every thriving commercial community seeking its own welfare.

BATH.—The Bath Society for the Promotion of the Fine Arts has held its first meeting this season at the Assembly Rooms. There were numerous works of Art exhibited, including various known works by Turner, Etty, Roberts, Sant, Herring, and other masters. The display, according to the local *Chronicle*, rivalled that of any of the preceding exhibitions of the society. Complaints of want of room and crowded meetings promise well for the established popularity of these exhibitions.

CARDIFF.—An exhibition of the Fine Arts was opened here in the month of December, under the auspices of the Bishop of Llandaff and Mr. Bruce, M.P., and a large number of the influential inhabitants of the town and its vicinity. A series of lectures will, we understand, be given during the time of the exhibition, on matters connected with Art. Mr. Bruce delivered the first of the series on the day of inauguration.

NORWICH.—The close of the Norfolk and Norwich Fine Arts' Association shows that, during the term of exhibition, pictures to the value of 300*l.* have been sold, and after defraying all expenses, a balance of 21*l.* 1*s.* remains in the hands of the treasurer: this is a good augury as regards the future. This society is much indebted for the success hitherto attending it to Mr. Claude Nursey, who acts as its honorary secretary. Mr. Nursey is head master of the School of Practical Art in Norwich, whose classes have been attended during the past year by 876 pupils; namely, 148 central school pupils, and 728 in the out-door classes.

WALSALL.—There was a public exhibition, at the end of the year, of the drawings made by the pupils of the Walsall School of Art, and on one of the evenings when the works were on view, Mr. Smith, the head master of the school, delivered a lecture "On the Utility of Practical Art." The prizes awarded to the successful candidates were presented to them after the lecture, by the mayor of the town.

CORK.—We are happy to learn that the Cork School of Design, which has now been closed for twelve months, is about to resume operations. The differences with the Department of Science and Art have been so far arranged as to admit of the school being re-opened, and a rate under Mr. Ewart's "Museums, Libraries, and Schools of Art Act" has been passed to provide for the local expenses. Mr. R. R. Scanlan, the late head master, having resigned, the appointment has been conferred on Mr. David Raimbach, a gentleman till lately in charge of the School of Art at Limerick.

LIMERICK.—The School of Art school, which has been closed since March last, was recently re-opened in connexion with the Athenaeum in that city.

WARRINGTON.—The inhabitants of this town have set a most laudable example in order to relieve the School of Art of a somewhat heavy debt pressing upon it. A bazaar, accompanied with sundry festivities, was held during the last month, which realised the handsome sum of 180*l.* for the purpose of discharging the obligations. This shows what may be done when much heartiness and a little expenditure of time and talents—especially on the part of the ladies, to whom the Warrington School is greatly indebted—are expended on any matter taken in hand. We can only point attention to the fact we here record, and trust it may prove a stimulus to other towns whose Schools of Art are in a similar position to that in which the school of Warrington was, to imitate the example. Mr. Brewtnall is the master of this school, and is entitled to praise for his exertions in superintending the bazaar.

INDUSTRIAL ART AND ART EDUCATION.

[We extract from the columns of one of the ablest and best conducted of provincial newspapers—the *Midland Counties' Herald*—always a safe guide and sensible exponent in matters concerning Art,—the following remarks from an article of considerable length, which reviews a pamphlet recently issued by Mr. Potter of Manchester. His views have received some comments and some replies from Mr. George Wallis, but they do not materially touch the main questions at issue. Any observations of his, however, are entitled to consideration and respect; and perhaps there is no master associated with the Government school, so free from prejudice, or so little likely to advocate opinions merely because they are those of the "heads" under whom he acts. We shall therefore take an early opportunity of examining the pamphlet of Mr. Wallis; while at present we content ourselves with adopting the views of our intelligent contemporary concerning that of Mr. Potter.]

A School of Art has existed in Manchester for seventeen years. It is conveniently located in spacious and well-arranged rooms, in which respect it is said to be unequalled by any other provincial establishment of the same kind in the kingdom. We find from the report submitted to its supporters, at their annual meeting in May last, that since the first recognition of the school by the government in 1838, the number of its pupils had never been so large as at that time, or the fruits of their assiduous application to study more encouraging. With these satisfactory results, however, the finances of the institution were not in a prosperous condition, which appears to have been owing in some degree to the diminution of the grant of public money in aid of its funds, under the regulations adopted by the "Department of Science and Art." They were very sceptical as to the propriety of the change which official wisdom had dictated, and they even went the length of declaring it to be objectionable, inasmuch as its tendency would be to establish an inequitable mode of administering the Parliamentary grant between the metropolis and the other parts of the country. They furthermore denounced the injustice of the Metropolitan Schools being entirely or mainly supported out of the national purse, while the regulations of the government operated to render the provincial institutions more and more dependent upon private resources. Having urged their views upon the Board of Trade without success, they came to the determination of bringing the whole question before Parliament during the last session; but owing to the engrossing interest of the war, and the attention which the French Exhibition required, both from the friends of the school and the officers of the "Department," both sides were willing to accept a temporary compromise, under which the council were induced to promise, in their management of the school, a full and fair trial of the propositions of the Board of Trade, who, on their part, promised them as liberal an amount of pecuniary assistance as existing rules would permit.

This is the present posture of affairs, and a very unsatisfactory one it is; but during the brief cessation of hostilities, the council, with prudent forethought, have been exerting themselves to strengthen their position. One of the steps taken by them in furtherance of this object was the holding, in October, of a *soirée*, at which the points in issue were discussed. On this occasion, Mr. Edmund Potter, the president of the school, delivered an able address, in which he considered, at some length, the character of such institutions, the purposes they are capable of serving, and the best means of rendering them efficient; and which is being extensively circulated in the form of a pamphlet. Regarding as proper and natural the anxiety evinced by the Board of Trade as to our position and prospects in matters of taste connected with trade, of which, as disclosed by the nature and extent of the competition in the French exhibition, he thinks some groundless apprehensions have been entertained, Mr. Potter proceeded to make the very important inquiry—has the Board of Trade taken the best and most efficient measures for the extension of that Art-education which not only they but all intelligent persons admit to be necessary for the promotion of Art-manufacture, whether in fancy ornamental articles, in metal, in pottery, or in textile fabrics? A very temperate examination of the evidence in the case leads him to a conclusion decidedly averse to the authorities at Marlborough House, and that had the funds at their disposal been appropriated to

teaching Art, either elementary or more advanced, on a sound, comprehensive system, trade would have been better supplied with more accomplished workmen, and would have educated and paid for its own technical labour. Mr. Potter comments with force and point upon the injustice of the arrangements by which the central school has rent, materials, examples, library, and the benefit of a most ample supply of superintendents, masters, and lecturers, all paid for at the cost of the state, without one penny of private subscription, or aid from such local rate as it has been suggested might be obtained by means of Mr. Ewart's act.

"We feel then," he remarks, "that whilst we are indirectly admonished for want of power to compete in taste, we are injured; that Art, and the desire for it, are not only repressed by our being treated in some measure as a branch school of inferior grade, but that we are restricted and lessened in our allowance, and thrown on local effort or local taxation, whilst we see a completely different example exhibited of liberality, if not profuse, in the metropolitan establishment. Let me admit, however, that Marlborough House has a staff of gentlemen perfectly able to conduct the Art-education of that establishment; I differ widely with the heads as to their mode of administration, and more particularly as to the position in which they would place the provincial schools of Art, by trying to make them into mere elementary drawing schools. They cannot expect gentlemen composing councils like yours, and in charge of schools established, and of property contributed for other purposes, to devote time and funds to the forwarding such schools, any more than they can expect them to associate together for the purpose of organising branch writing schools.

"I wish to confine myself in my remarks to the position of schools of Art, quite apart from elementary drawing schools of recent establishment. I would ask, how it is that scarcely one out of the nineteen schools of Art established since our own, chiefly by the aid of local funds and subscriptions, is now in a comfortable position? I have reason to know that the large majority are in a very uneasy, uncertain state, with lessening funds, apart from the war question; and that from the very nature of their undefined and unstable constitution, the present process may let some of them down to elementary drawing schools, or found such on their ruins. One thing is certain to my mind, that local schools of Art have as yet not been established on a permanent basis. It is because I am anxious that they should be so, that I wish to press upon you the fact. They expire in large towns, or are shut up, because they are at issue with the department of practical Art, or because the country has not appreciated their value. I do think the action of the Marlborough House department upon the provincial schools has been disastrous; it has created no kindly feeling, no sympathy; and the spirit in favour of Art-education has, I believe, suffered amongst us."

Mr. Potter is of opinion that the country does not yet appreciate the schools; that they are held in comparatively slight estimation, and that but a limited use is made of them in comparison with their real value. Most cordially do we concur in the arguments subsequently advanced that Art-education ought to be diffused; and that if manufactures need the development and encouragement of a more elevated taste, here in the provinces—the seat of such pursuits—ought the means of improvement, the examples, and embellishments to be afforded; that in proportion to our numbers and taxation, we have a right to our share of public instruction and ornamental display; and that the wider such agencies are spread, the more likely is good to arise from them. Mr. Potter thinks that the remedy for the evils of which he complains may be found in the transfer of the anomalous powers in reference to them, now exercised by the Board of Trade—the department of the State most overtaxed with the weight of its own proper functions—to some competent branch of the Government, less fluctuating in its constitution, more specially adequate to the discharge of the duties devolving upon it, and directly responsible to Parliamentary control:—

"To effect this, I venture to think the best mode would be to create a board for the advancement of Art-education and public taste, with a minister at its head, not for life, nor yet liable to be turned out of office after a period of a few weeks, or a few months, but with a chance of some years' occupancy or experience. I should like to see a man appointed, competent to undertake the chairmanship of such a board, equal in class to what we have had in a Buller or a Baines at the Poor Law Board, with a similar position and standing, and, if practicable, with a seat in the House of Com-

mons—the representative literally of some art-constituency—why not, if a university for letters have such? I would have him joined at his board by a few, very few provincial representatives of art interests to aid and suggest in the distribution of even the present funds, if no more were granted. As to the expense, if it could not be otherwise met, a few thousands a year could be well saved, for such a purpose, from certain items in the grant now made to the Department at Marlborough House."

But Mr. Potter has yet another objection to the existing system. He is opposed to "technical" or (as he chooses to style it) "trade" teaching, "as out-stepping the province of the Government, encouraging and patronising, as it always does, particular branches of trade in particular localities for the sake of employing a particular class of labour, and from motives of benevolence rather than sound economy." Further on he adds:—

"You will have gathered from my opinions, that I think one great error has been made since their original institution in London, and that with the exception of the Elementary Drawing Schools, the government, instead of teaching Art, has rather been trying to do what I consider the worst possible thing it could attempt—trying to teach trade."

"Their anxiety has been for trade, not for Art. I would now suggest that they try strictly what they can do for Art dissociated from trade, and from the Board of Trade, as the most unsuitable department of the government to have the direction of matters of education in Art and taste particularly."

THE PUBLICATIONS OF MESSRS. LLOYD BROTHERS & CO. IN 1855.

THESE eminent publishers have been prolific during the past year; notwithstanding that the times have been greatly against luxuries, and that the war has operated grievously to the prejudice of Art. Their list contains between thirty and forty publications, of varied character, ranging from high class works to those of a cheap, yet good, order, which modern improvements in coloured lithography have brought within reach of the multitude; supplying close imitations of drawings which, except for their intrinsic value, are calculated to give as much enjoyment as the original productions of the artist. Messrs. Lloyd & Co. absorb a considerable portion of what is called the "country trade;" but their establishment, on Ludgate Hill, is well-known as the source from whence the city is to a large extent supplied with prints. We have had frequent occasion to direct attention to their issues, and it is now our duty to speak of those they have sent out during the past year.

The first that may fall under our notice is a large print engraved by Bellin, from a painting by Claxton, representing "The Saviour blessing little Children." In size and form it is designed to companion the beautiful work of Eastlake, "Christ looking down on Jerusalem." It is a fine and vigorous composition, telling the story with force and effect. The groups are skillfully arranged. The mothers and their treasures are gracefully introduced; and if the excellent artist has comparatively failed in depicting the Saviour, he has but followed in the steps of nearly all his modern predecessors.

Of opposite character is another large print, entitled "A Glimpse of an English Homestead," engraved by Paterson, from one of the pictures of Herring; the subject is a covered shed, adjacent to a farm-yard. The prominent objects are two horses—a white and a black; at their feet are the ducks, fowl, chickens, rabbits, and pigeons, in describing which the artist surpasses all his compeers; indeed the painter has contrived to introduce into this work all the peculiarities of art for which he is famous—not forgetting the produce of the kitchen garden, and the young girl who presides over the homestead as the guardian of the pets.

Another large print is "A Sunny Summer's Afternoon;" a lithographed impression from a painting by Sidney Cooper. The scene is thoroughly English—there is no mistaking it—

and it is therefore especially welcome; for, although the world has been of late years searched for subject-matter, the lanes and meadows, the rich low-lands and picturesque hills of England, have been too much neglected—that is to say, as far as the publisher is concerned. Save the charming mezzotint prints, after Constable, we can call to mind few or none of this beautiful and interesting class. The scene here represents a pool in low soil, beside which grows a noble oak, under the branches of which cattle are reposing, while others are drinking of the refreshing water at its foot. The lines illustrated are from Thomson. Here, as in the instance just alluded to, the more prominent excellences of the painter are brought together. To say that the picture is by Sidney Cooper, is almost sufficient to describe the accessories and the manner of their treatment.

The next we notice is a pretty and touching print, engraved by S. Bellin from a picture by T. Brooks, representing three orphan children by their father's grave in the village churchyard. A guardian angel, visible to the spectator, though not to the orphans, is watching over them. The story would have been, perhaps, better told without this introduction; it gives too much the air of melodrama to that "touch of nature" which connects the living with the dead. The sympathy of the rough dog, who looks up to the young mourners, supplies an incident more effective.

The oft-told tale of two young ladies consulting over a love-letter has been treated by Mr. Brooks, and a very pleasant engraving, entitled "Strictly Confidential," is the result, though with but little pretension to originality, either in conception or treatment.

Of an infinitely better order is another print,—"Bed-Time"—a line engraving of a high order of merit, by Mr. Lumb Stocks, from a painting by Frith, R.A. It represents a young mother hearing the prattled prayer of her child before consigning her to rest. The circumstance appeals to all, and is understood by all; there needs no writing to tell the story. Perhaps there are few, if there be any, recent publications more likely to become popular than this.

Though very opposite in character, as much interest and pleasure will be derived from two prints, named "The Old School" and "The New School," and bearing the dates 1755 and 1855. They are pictures of shipping. In the one is the now aged and worn "Victory," but then in its prime, surrounded by the varied craft of the period, which made the sailors who made "Britannia rule the waves." In the other is the smart steam-frigate, warranted to reach Australia in sixty days. The contrast thus produced is exceedingly agreeable. "The pair" should be hung in the cabin of every ship in the service, and cannot fail to be welcome acquisitions to all mariners, young and old.

A lone maiden sitting by the sea-shore, her thoughts following her heart across the ocean, is charmingly engraved by James Faed, from a picture by Thomas Faed. The subject is somewhat painful, but it is treated with much skill, and bears evidence of considerable power in the painter.

A series of small "Sporting-Prints," from paintings by Ansdell, very excellently engraved by Ryall, cannot fail to find favour with all to whom this class of subject is desirable. It is a class that always has been, and ever will be, popular in England, where "field-sports" supply so prominent a pleasure-occupation of the aristocracy. These are small prints, about 10 inches by 7, but they are not the less valuable on that account. They are of marvellous fidelity; each represents a dog occupied according to his nature—whether pointer, lurcher, bound, or water-spaniel, and each has found, or is bringing in, his bird. The engraving is of the best order of merit, and perhaps no series of this kind better deserves the success it is certain to achieve.

There are other issues of Messrs. Lloyd—in line, in mezzotint, in stipple, and in lithography,—the produce of the past year, to which we can do no more than allude, as proofs of their activity as publishers; but some reference to those productions in coloured lithography, for which they seem especially to have "laid them-

selves out," is needful, in order to supply to our readers a reasonably fair report of the progress of this house.

These are chiefly issued in pairs; and are so closely imitations of original drawings, as to startle by the apprehension that they may satisfy so many as materially to abridge the actual labours of the artist, and so act as heavy blows and great discouragements to the profession. We know, however, that such is not the case: since the improvements in coloured lithography, carried out by Messrs. Hanhart, Messrs. Day, and Mr. Brooks, to say nothing of Messrs. Rowney, whose productions we not long ago reviewed—the societies of Painters in Water-colours have not only not retrograded, but their occupations have increased, and at the two great exhibitions of the season there have been very few works of merit left unsold. Yet these very beautiful pictures (for they may be safely so called) will go a long way to content even the connoisseur, and certainly the public, for the absence of more costly productions from their portfolios or their walls.

The first two we examine are copies of slight sketches by John Absolon: "Hay-Harvest" and "Corn-Harvest;" they are free in touch, and bear no pretence to finish; but they have the marks of the master, and are full of sparkle and spirit.

To show, however, how well the art can deal with more elaborate works, we turn to a copy of "Bielsten on the Moselle," by J. D. Harding, and its companion, "Sunset on the Danube," by J. Bright. The former, especially, represents with singular fidelity the work of the accomplished master, in that rare combination of delicacy and force by which his name has been placed among the highest in the records of fame. We have here in contrast with the two we have noticed above, satisfactory evidence that, no matter with how much elaborate care a drawing may be painted, the lithographic artist can imitate it with so much marvellous accuracy, as to substitute the copy for the original with little fear of detection by the ordinary eye.

A set of three pictures after Jenkins, of incidents among the peasantry of Normandy, perhaps—in France, certainly—are among the pleasantest productions of a class always agreeable, and ever welcome. One is of a young mother with her child pick-a-back; in another she guides her child over a plank across a brook; and in the third she watches her child, which is peeping into a well. The picturesque costume, the home-incidents, and the treatment of the subjects, combine to render these imitative drawings among the most popular that have been produced in this style of Art.

Even more pleasing than these, is one that is as yet without a companion; it is a copy from a painting by Alexander Johnston, which represents the "two bonnie lasses," Bessie Bell and Mary Grey, famous in Scottish song and story; they are sitting by the burn-side, full of health, as mountain maidens always are; and with that beauty and grace which Nature gives to her favourites. The print is a charming specimen of the artist's power; and a very valuable example of the Art which does so much to create enjoyment and to bring pleasure at all seasons within doors.

Our notice may be closed by a brief reference to two small lithographic copies of Stanfield—Fort Rouge at High and at Low Water. They are slight in character, but characteristic of the great master, and seeming to bear his touches.

We have written sufficient to show that to the active enterprise of Messrs. Lloyd Brothers & Co. the public is much indebted for a supply of excellent and attractive prints. None of those upon which we report are of the very highest order; but they are all good of their kind, and of a class which is especially needed, inasmuch as they minister to the wants of the many rather than the few, and bring excellence within the reach of those who find the more costly luxuries of Art beyond their grasp.

This great and high purpose has been achieved only within the last few years: twenty years ago it would have required pounds to have procured that which now-a-days a few shillings may obtain. The good hence derived is incalculable; instead of taste being impaired, it is

improved by acquisitions that are offered "cheap." "Cheap Art" is ever a thing to be decried, if not of such an order that the mind is strengthened by enjoyment, when the acquisition is made. We have done our own part in this matter; and it is and will be the most agreeable of our duties to aid those publishers who, like Messrs. Lloyd, adopt as their motto, "mind not high things, but condescend to men of low estate."

We must not, however, be misunderstood. These publishers by no means confine their issues to works of comparatively humble cost; although to this essential point our present reference is chiefly made. They have produced and are producing works of large expense; we need but now refer to two of them—"The Sands at Ramsgate," from the famous picture by Frith, and "St. Michael's Mount," from one of the most admirable productions of Stanfield.

ART IN CONTINENTAL STATES.

PARIS.—A serious accident has occurred at the Palais des Beaux Arts, by which the "Hercule" of P. Delaroche has nearly been destroyed. On Sunday, the 16th December, the annual distribution of prizes was, as usual, to take place before the Minister of State and the Members of the Academy. The wood forming the seats, being very dry, caught fire, the warming-stove having been too much heated. Assistance fortunately was at hand, and the flames were got under before this fine painting was totally destroyed; but as it is, the damage is considerable, the greatest part of which consists in the heat having disjoined the stones of the building on which the painting is executed; the following method having been adopted. Previously to beginning his laborious task, the walls were thoroughly dried with great care, after which a layer of strong drying oil was laid on; this, when dry, was covered with a coating of white paint, the same as is spread on canvas for painting. At first the whole of the painting appeared destroyed, but on removing the smoke and soot occasioned by the flames, much was found uninjured. The damage done is to this extent:—out of 75 figures composing the work, only 20 are completely uninjured; 30 will have to be thoroughly repainted by Delaroche himself; the rest will be repaired by M. Mercier, restorer of paintings, who was chosen for this task by the Minister of State, and who has begun the cleaning. The intense cold following the fire, the smoke, and the vapours from the water employed in extinguishing the same, caused the injury; it is astonishing so much carelessness can exist in a government establishment, where so many persons are employed. This event ought to make the directors of the Louvre seriously careful of our great gallery, which is placed in long rooms serving as barracks for cavalry and other troops.—We have recently lost an excellent painter of the French school, M. Steuben; his principal works are, "Napoleon's Return from Elba," "Napoleon at Waterloo," "Death of Napoleon," "Peter the Great saved by his Mother in a Revolt," "Judith and Holofernes," "Samson and Delilah," "Esmeralda and Quasimodo," "Esmeralda and the Goat Dancing," "Christ on Calvary," "Napoleon on Mount St. Bernard," "The Youth of Milton;" most of them have been cleverly engraved by Jazet and others.—A very splendid equestrian statue has been placed in the centre of the Louvre; it represents Francis I., and is by Clesinger; the execution is fine, and the attitude commanding, but it is too large for the situation; it is probable another place will be chosen for its final destination: the present statue being only a plaster cast, bronzed, it will form a magnificent ornament in a proper situation.—The interior of the Carusel is now open to the public, and it certainly is most superb.—A medal is being executed at the Paris Mint, in commemoration of the taking of Sebastopol; it is by M. Borrel.—Messrs. Merley & Caque have been commissioned to execute a medal of large dimensions, to commemorate the celebrated public subscription of 500 millions, which was more than quadrupled by 180,000 subscribers.—The picture-sales are now in full vigour; that of Camille Roqueplan, deceased, consisting of a few finished works, and the usual miscellaneous mixture of sketches, unfinished works, &c., has sold well; this could not have been otherwise, as his works here are much sought for; I send a few prices:—"Promenade in the Park," and "The Swings," bought by M. Hottinguer for 9800 f.; "The Rent-Day," 2200 f., to M. Davin; this

amateur has also purchased several other works; the sketch of the 'Lion Amoureux' realised 1005 f.; it was bought by the Marquis of Hertford, who purchased the original for 15,000 f.: 'The Prohibited Novel,' 1680 f.; 'A Daughter of Eve,' 1150 f.; Mr. Stevens bought the fine drawing in charcoal of 'France victorious, dictating Laws,' being the sketch for the ceiling of the Luxembourg Palace, 1300 f.; and 'The Garden at Eaux Bonnes,' 910 f. M. Hoquet, a clever landscape-painter, has also made a sale of his works; 21 pictures brought about 10,000 f. M. Tesson has also recently sold 34 paintings, and 24 water-colour drawings, of considerable merit. The French artists have adopted the plan of amassing a quantity of their works, and selling them by auction, no doubt in consequence of the little encouragement given to Art in this country, where a few favourites engross all the patronage; this plan reduces Fine Art to the standard of mere trade.—A discovery has lately been made by Mme. Rouvier-Paillard, of considerable importance; this lady has, it is said, discovered a method of liquifying ivory, and using it instead of plaster, for casts.—Paris is being driven out of town; 6000 fresh notices to quit have been issued, to complete the Boulevard de Sebastopol, and others in project.

KÖNIGSBERG.—The Art-Union, founded here in 1832, has met with extensive encouragement through the exertions of the late minister Degen, inasmuch as now to number fourteen hundred subscribers. This extensive patronage has been procured by all the legitimate means available in furtherance of these institutions, especially by the establishment of a public gallery for the exhibition of modern works of art. In the gallery of the Museum there are a hundred modern productions, many of which have been purchased, and others presented to the collection. There is a proportion of old pictures, to many of which attach names of great celebrity; but the greater space is given to the works of recent and living artists, among which we find productions by Schröder, Schorn, Stilke, Solm, Christian Kohler, Leopold Robert, Verboeckhoven, Ary Scheffer, Delaroche, Gudin, &c., &c.

BERLIN.—Great activity has of late prevailed here in the erection of private residences. It is especially the Western and more wealthy parts of the city that have been enriched by this marked improvement in domestic architecture. In the Friedrich Strasse considerable improvements have been effected; and in the Leipziger Platz, a beautifully decorated house has been substituted for the unseemly brewery, which was a principal feature in that locality; and of the most tasteful and elegant buildings the most striking is that erected in the Bellevue Strasse after the design of Hahnemann. It is intended in the course of next summer to forward an entirely new street to be called Humboldt Strasse, intended to connect Link Strasse and Potsdamer Strasse. This street is to consist of elegant and commodious residences.—The Museum has recently received from Rome the addition of an excellent plaster-cast of the famous sarcophagus of Junius Bassus, who, as prefect of Rome, died soon after his baptism, in the year of our Lord, 339. It is richly ornamented, and compartments formed by pillars contain sculptured subjects from sacred history, besides a series representing the "Seasons." This museum contains, besides, casts of eight other ancient Christian sarcophagi, very highly ornamented.—The recent contributions to the permanent exhibition are numerous and valuable, and afford evidence of the industry of artists to support this institution. Magnus exhibits two life-sized portraits, one of the Minister Von Arnim-Boitzenburg, works of a high order of merit, though perhaps the features of the lady are somewhat too material, not treated with that lightness which points rather to Nature than to Art. By H. Kauffmann a genre subject is exhibited, showing the banks of a river, along which a vessel is being towed; the perspective of the picture is extremely difficult, but it is managed with much success. Among the landscapes there is a striking work by R. Krause entitled 'From the Mountains of Albania'; the scene is wooded, and is presented under a sunny aspect, and it is well made out generally, with the exception of the foreground, which requires more careful detail. A 'Landscape with a Stormy Effect,' by F. Rollmann, shows a fine feeling for the poetry of nature; the clouds especially are effectively painted. A 'View of Havre,' by J. Rauch, is not without many beauties in the colour and tones of the sea, land, and sky, but generally the picture is brought forward in a manner cold and dry, and the drawing might be more careful in parts. A picture, by A. Berg, entitled 'Ruins of the Cathedral of Myra, in Lycia,' is a work of great merit in its particular, and is interesting as a faithful representation of an attractive archaeological relic. There is, by Valentine Ruth,

of Düsseldorf, a wooded landscape of the rarest excellence in its department of Art. This work is worthy of a lengthened description, but we have not the space at our disposal. There are other meritorious works, especially by Jabin, also of Düsseldorf, by Nordgren, Morten Müller, Herrenburger, Ehrke, &c. &c.

DRESDEN.—It will be remembered that we mentioned a proposal, first brought forward in Dresden, for a subscription for a memorial worthy of the name of Friedrich Schiller. The appeal was made to universal Germany, and nobly has it been responded to, a sum of 3000 thalers having been soon subscribed. Branch committees have been formed at Vienna, Munich, Stuttgart, Frankfurt, Hamburg, Leipzig, Breslau, Darmstadt, Offenbach, Nürnberg, and many other places.

MUNICH.—The reception accorded to German works of Art at the Paris Exhibition seems to have given some dissatisfaction. Many of the comments we have seen are much less moderate than the following extract from a German paper:—"It is highly advantageous that the Fine Arts should be sent upon their travel to see the world and to be seen by the world. Many a home-earned reputation is shattered by the judgment of the world; but on the other hand, many a smaller light has given forth a steady lustre when raised to a place of eminence. The judgment that has been passed upon our works in Paris is not final, and may be a faulty one. But this much is incontrovertible—that when nations mingle with each other, true greatness becomes manifest; that whatever becomes distinguished in the confusion of such a competition it is not a result of accidental or particular taste, but of a general conviction of intrinsic worth."

NÜRNBERG.—Some of the mural paintings by Dürer are in progress of being copied for the collection in one of the public museums, especially the admirable group of 'Musicians in the Town-hall,' which has been nearly destroyed by the bad retouching of Gabriel Meyer, and the ravages of time. By washing preparatory to the process of copying, parts of the painting have effectually been brought to light, but only a part. In the middle of the wall is a beautiful balcony, which architecturally belongs to the fourteenth century. Above this is a picture which is, in truth, but little suited to it; and on the roof are seated two nude figures of children, who hold flags on which are emblazoned the arms of the city of Nuremberg. The lower part of the balcony is ornamented with paintings, and on each side are figures, or, rather, *were* figures, for they are only now just discernible. At the extremities there are two emperors, of whom one is determinable as Charlemagne, but there is no means of ascertaining the name of the other. Besides these, there are many other figures, to which names cannot be assigned.

PROFESSOR COCKERELL'S SECOND LECTURE ON ARCHITECTURE.*

IN his second lecture at the Royal Academy, on the 10th of January, the Professor said,—On the annual recurrence of the present season, when he had to prepare himself for the performance of that evening's very agreeable duty,—when he was relieved, for a short time, from the turmoil and bustle of this vulgar world, and was enabled leisurely to contemplate the noble and important art which they had in hand; to view its deeply-interesting history and expand the wings of imagination upon its delights, and dwell upon its openings up of the sublime and the beautiful, he felt himself almost overwhelmed by the conviction of his incompetency to represent the dignity of so noble a science. When he looked at the ingenuity of mind required; the mathematical attainments, the natural endowment of sensibility, the taste, the invention, the poetical imagination, the genius which were essential, he was really appalled; and he took courage only in the grand principles asserted by the masters of the art; and in reliance upon the candour of his hearers, and in the admission

* We are indebted to the industry of our valuable contemporary, the *Builder*, for this report of Mr. Cockerell's Second Lecture at the Royal Academy, and regret we were not in a position to notice the first. These lectures of Professor Cockerell must interest many others besides the professional student.

that all were bound to make, that while desecrating on so glorious a subject, they were by no means required to be masters of all its departments. So entirely did the Academy of France appreciate the extent of the difficulty of the art, that to carry out instruction in all its parts, they had established three special professors of three departments of architecture. The first was a professor of The Theory of Architecture; the second, of The History of Architecture; the third, of the Statics of Architecture; and during the season they had many lectures, as well as direct teaching. Many of the scholars were sent to Rome and Germany for five years, at the expense of the Government, the Government having a claim upon their talents at all times. Thus the French Government never lost its hold upon those who had derived advantage from its patronage.

They ought, in directing their minds to this great art, to approach it with all the respect, humility, and circumspection which a subject so grave required. Proficiency in it was in a great measure to be attained by study and by genius—by disinterested, long, and faithful pursuit of books in the first place. They should study the works of Blondell and many others which would at once occur to their minds. Again, this art was to be cultivated by careful travels; by observations in travels at home as well as abroad; by seeing monuments in their proper sites; by emancipation, as far as possible, from the ordinary business of life; and by that leisure which enabled the mind to expand into those speculations and day-dreams which constituted the delight of the architect. But then, from the art itself, to go to the great practitioners of the art,—to their interesting biography, and the benefits which their genius had conferred upon society; creating, originating, promoting the arts of industry and civilisation, the union of a vast variety of knowledge, and the benevolence which it had brought to bear upon their creations; so that they might feel all the force of the language of an ancient writer who had no higher epithet to apply to the Maker of all things than "The Great Architect." There was indeed, one individual to whom they might apply the title "architect"—as the architect of his own fortune—Sir Christopher Wren. He was a scholar from his childhood; a great mathematician at thirteen; professor of astronomy at Gresham College at twenty-one; at thirty-seven surveyor-general to this country and kingdom; and after the Fire of London, at forty-three, appointed to St. Paul's; the principal founder of the Royal Society, and the largest contributor to it; the founder of the Commission of Sewers; the sustainer of schools of art in the Society of Freemasons,—then acting in their original and proper character as builders; the friend and counsellor of the king, and of the wisest in the State; and the chief benefactor of his country. It was wonderful to contemplate such a character, and to consider that he had left, for special study, structures which could not fail to delight and instruct those who were familiar with his works. Many of Wren's works were without parallel in foreign parts, and were cited by the French as constituting our best title to the possession of taste in architecture. His works were more or less published, and his friend, Mr. Clayton, whom he had the happiness to assist, had added a great deal to what was before known. There were many works still unpublished, and he would recommend to them as conferring a benefit on the profession, that they should, when opportunity offered, so prepare them as to give them to the public. The age of Sir Christopher Wren was one of peculiar magnanimity in all that affected art and science, while every succeeding age had brought us to that commonplace and plobian mediocrity with which so many at the present time were content; so that we were now beginning to be considered, in all that belonged to the fine arts, as inferior to other countries. In his (the lecturer's) late visit to Paris, he had had the advantage of a critical view of the architectural monuments of that famous city, in company with one of the first architects of the day. Putting aside the advantages of climate, and of material exemption from smoke, which conferred so great a

lustre on the works of that city; and waiving all that distinctive talent for ornamental design, in which the Italians themselves confess the French to excel, he would challenge their pretensions to the graver merits of architecture, and would discuss deliberately with them the beauties of St. Paul's, Greenwich, and other works of Sir Christopher Wren and Inigo Jones, in comparison with their own, as far superior in harmony, unity, variety, invention, and taste. In his first visit to St. Paul's after returning from Paris, he was especially struck with the dome and towers of that building, which, seen from Fleet Street or Ludgate Hill, at about eleven o'clock on a summer morning, presented one of the most striking views in Europe. St. Paul's was without a rival in its beauty, unity, and variety.

The position of the consistory and morning chapels, the mode in which the aisles were finished with hemispherical domes, and, in particular, the novelty of the contrivance of the windows within the apse, by which the light penetrated into the building after the Gothic mode, was peculiarly striking. There was all the strength of a pier, all the grace which such an apse must give, and a lightness which he believed was unique,—for he had found such a combination nowhere else. It was commonplace to point out to them the absolute novelty of making a dome equal to the width of the whole church, instead of the usual mode of making it equal with the nave. It gave him great pleasure to find in the work of the Rev. Mr. Petit, great commendation of the first model of St. Paul's. When they proceeded further to consider the economy of the structure, its contrivance throughout for sanitary and meteorological purposes, its grace and ornament, a judicious mind could not but rejoice in so marvellous a building in our country as conferring a lasting renown upon us. The building was remarkable for its adherence to rule and the masonic laws. With regard to character and taste, St. Paul's was a remarkable instance of combination. Sometimes the elements of the sublime and just were handled with a strangeness of proportion and physiognomy, or with some extraordinary audacity, as in Boronini, Michel-Angelo, the chief of the Italians, and a great many among the French. One man surprised and alarmed—created terror and astonishment—by a sort of clumsy power; but Wren was an artist following Nature, in whom they found no extravagances or excesses of power: all was correct and harmonious.

In the Gothic an unearthly attitude was frequently attempted, and in much of the French architecture they found an overstepping of all masonic rule. Such extravagances might transport with their novelty, but they violated the correct spirit of masonic architecture. Wren always trusted to the natural character of his contrivances, and the perfection of his equipment.

No architect of Europe in his day understood better, or more highly appreciated, the merits of Gothic structure. Witness his surveys of Westminster and Salisbury churches; his restorations of St. Michael's, Cornhill; and many others. St. Paul's is, in fact, a Gothic structure, clothed in classic garb.

In comparing the quality of taste in Wren's productions with that of other masters of his period, the Professor illustrated the modesty of his character. The sublime displayed itself rather to the understanding than to the eye in his forms and combinations. Inigo Jones exhibited more pomp and passion, he was more of a painter than Wren; but he never dreamt of the structural combinations which the mathematician delighted in. Wren overstepped not the modesty of Nature, while Hawksmoor, his pupil, more striking to the eye, discarded all logic. Hogarth has ridiculed his Lion and Unicorn on the spire of St. George's, Bloomsbury, by placing it in the background of his drunken scene at St. Giles's,—as if Hawksmoor was scarcely sober when he designed it: his squinting columns in the niches of St. Mary Woolnoth, are equally indefensible.

Vanbrugh had much of the same taste, and improvised in stone such works as were admissible for theatrical scenery on canvass only. He affected force and magnitude of parts, but

he stood on the dangerous limits between the sublime and the ridiculous.

He went on to compare Raffaele and Michel-Angelo in the same strain, illustrating his position by the advice of Hamlet to the players; and he recommended that the student should set his mind to distinguish between real greatness and swagger, between daring and balderdash, the massive and the coarse, grace and affectation, intricacy and confusion, elegance and effeminacy. These were the essential distinctions which we should well consider in the formation of our taste.

Very few indeed were those who were enabled to carry out works, but they might design them. They might put them on paper, and thus become useful to their country. The Palace at Whitehall was estimated on the continent as one of the finest works of that day.

In the Vitruvian element "*Dispositio*," the architects of that day were conspicuous. Both Inigo Jones in Whitehall, and Wren in the examples cited, reminded us of military disposition and battle array, with all the order and discipline of warfare in the sixteenth and seventeenth centuries, which had reversed the desultory system of the previous centuries under the feudal warriors. The disposition of buildings had participated in the reform, as these arrangements had been always determined by the accidents of site, and generally by ecclesiastical requirements, and had all that picturesque (so contrary to architectural principles of Wren's day) which sketching ladies and gentlemen adored in the present.

Inigo Jones and Wren had earned for us the good opinion of Milizia, amongst other foreign writers, who had said, that architecture, banished by the licence and caprice of other countries of Europe, had taken refuge in England.

He would particularly invite the attention of the younger members of the profession to that magnificent palace projected by his Royal Highness Prince Albert at Kensington Gore, which, at some time or other, he hoped they would see rising, a splendid national monument. The site was equal to the site of any of the great buildings of Europe. That palace would really be a subject of useful study to those before him, in comparing the great monuments of Europe, and so exercising their own genius as to produce something which should do honour to their country. They might, of course, have competition in which one would be successful, and others not thanked for their pains. That was one of the degradations at which their art had arrived, and which it behoved them to try and relieve it from, namely, the discreditable manner in which such efforts were received. He presumed the only way of so doing was to make their efforts really worthy of respect; and to teach, if possible, all supercilious observers and judges that there was something due to those even who were not successful. It was a great gratification for him to find that a late friend of his had left a legacy of 40*l.* a year, to be given to the unsuccessful candidate for the gold medal. The first candidate, the donor said, had his reward; but the second, who had made all possible effort, and who probably might be very near the first, had failed, had lost his time, and his means, perhaps; and now there were 40*l.* to prevent this. Finally, while we were bound to acquaint ourselves with foreign examples, to respect and to borrow from our illustrious neighbours, who were ever intent on the advancement of every noble art and science, we were not to overlook our own, or to depreciate those masters who had conferred such lustre on our country; and he recommended the remark of Pliny, that "we often make expensive journeys to visit objects, which, when under our noses, are neglected. I know not," says he, "whether it is an order of nature that we are incurious about everything we are not obliged to seek, or that the desire languishes when an object is easily obtained, or that we defer always that which we can visit any day."

From whatever cause, certain it is that our own country possesses many objects which, at a distance, in Greece or in Egypt, we should regard as miracles; and we should visit and illustrate them in the most complete manner.

PHOTOGRAPHIC PICTURES OF SEBASTOPOL.

HAVING seen views of Sebastopol, and everything in connection with the place, both before and during the siege; nothing was wanting to complete our knowledge of the localities, and the great events in connection with them, but a pictorial description, *after the siege*, of all these places, the names of which have become so familiar to us through the daily press. This exhibition, consisting of a series of Photographs by Mr. James Robertson, chief engraver to the Imperial Mint at Constantinople, is to be seen at No. 222, Regent Street, in the rooms of Mr. Kilburn. It contains views of the Redan, the Malakoff, the English and French approaches; the Little Redan, all the famous batteries, and every site deriving a melancholy celebrity from those names which now distinguish them for ever, through their ample baptism of human blood. We have referred to these works in another page of the present *Journal*; but a somewhat more extended notice is due to them.

"The Panorama of Sebastopol, taken from the Malakoff, showing the City, Dockyard Buildings, Forts Nicholas, Constantine, Paul, and Michael; the Karabelnaia Suburb, and North side of Sebastopol," presents the city as it were desolated by a succession of earthquakes—here and there a building more or less entire in its outline, affording a sad contrast with the universal ruin amid which it stands. Again, the "View of Sebastopol taken before the last bombardment," shows some portion of the city apparently uninjured; the more distant parts look almost as entire as before the siege. But it is not so much in the city itself that indications of the fearful struggle are to be seen, as throughout the immediate scenes of the closer fighting. In "Part of the Barrack Battery, showing the Mantelettes for the protection of the Russian gunners," we find this battery armed with ships' guns; with everywhere manifestations of the exertion of a destructive power, more fearful than might even be conceived of tremendous artillery. A gun is here seen which shows the method of protecting the gunners against the deadly Minie—that is, a coil of rope, forming a high collar round the gun; and here is an indescribable confusion of broken gabions, sand-bags, shot, powder casks, and every species of material, defensive and offensive, inducing the conclusion that long before such destruction could have been effected, the Russians must have been compelled to cease working their guns, for the parapets are so broken in as entirely to prevent the movement of the gun carriage.

"The Interior of the Malakoff Battery" presents a similar spectacle; and it would appear that none of the battery guns which the enemy were said to have withdrawn from the seaward forts, have been employed in arming these works, because all the guns are on ship-carriages. The parapet here, also formed of gabions and sand-bags, is broken in a manner to exemplify the irresistible intensity of the fire; and in another picture an incident occurs, showing the mere accident on which depend great results—it is entitled "The Remains of the Malakoff Tower, with the Telegraph erected by the French: a bomb shell is distinctly visible imbedded in the wall; it fortunately did not explode, had it burst it would have blown up the French Magazine." The hut of the Russian General is not an edifice promising a comfortable place of residence, though the interior may be more satisfactory; it would be difficult to determine it, at a very short distance, even as a place of temporary abode.

"The Breach of the Redan, where the great struggle took place," is one of the most interesting pictures of the series, although, of course, the space represented is too circumscribed to assist a written description, beyond the mere spot represented. "Chapman's Left Attack, showing part of the Redan," describes a portion of the difficulties of the approach; and the spectator is assisted by "Gordon's Battery, with the Redan and Sebastopol in the distance." There are also, "The Corner of the 21-gun Bat-

tery, with the Trenches between the Mamelon and the Malakoff;" "The Sailors' Battery;" "View of the Malakoff Battery, taken from the Mamelon Vert, showing the French Approaches;" "View of the English Trenches, with the Malakoff in the distance." "The Interior of the Barrack Battery, with the pivot guns commanding the Ravine," describes the resources of the Russians in mounting these guns; the support of which is the trunk of a tree driven into the ground, and on this the gun pivots. But if in these views we are to estimate the importance of Sebastopol by the evidences of the defence of the place, we cannot regard it otherwise than as the keystone of their intended Oriental dominion.

MINOR TOPICS OF THE MONTH.

THE NATIONAL GALLERY, it is said, will shortly be enriched by the addition of three pictures bequeathed to it by Mr. Samuel Rogers: "Christ appearing to Mary Magdalen," by Titian, formerly in the possession of the Muselli family at Verona, subsequently in the Orleans Gallery, and lastly distinguished as the gem of Mr. Rogers's collection: it is a glorious work, in excellent preservation. A "Head of Christ," by Guido, engraved many years since by Sharpe, is a beautiful specimen of the painter's chaste colouring and tender expression, and the portrait of a "Young Knight," by Giorgione, a small full length, which Dr. Wagner describes as "noble and powerful in face and figure; the head of masterly treatment, in Giorgione's glowing tone, the armour of great force and clearness in the chiar-oscuro." A note appended to the above remarks states that "this figure is a study for the St. George in the altar-piece at Castel Franco, the only difference being, that in the latter the figure is helmeted." These pictures will be quite an acquisition to our National Collection, whose growth is but tardy, and its strength not always keeping pace with its increasing size. The remaining pictures, drawings, and objects of vertu left by Mr. Rogers, are to be sold by auction.—The picture brought home by the President of the Academy is waiting for its frame. As the work is large, it has been a matter of some consideration where it should hang, and it has at length been determined that it should occupy the place in which the Del Piombo now hangs,—that is, to the right on entering the door of the great room; and that the Del Piombo shall be moved to the place in which the Paul Veronese now is,—that is, the centre of the same room on the right, and here, we think for the first time, will the Piombo be seen in a light really suitable to it. The three pictures bequeathed by Mr. Rogers have not yet been placed; the light in which they were seen in the places they have so long occupied was by no means so favourable as could have been desired: it is probable they will be better shown in the National Gallery, although there all the best places are filled.

THE BRITISH INSTITUTION.—This gallery will be opened, as usual, on the first Monday of February. We have not heard of any new arrangements, and imagine that matters will be conducted much as hitherto; we have, however, hopes that a general advance will be observed in the works of the contributors.

MR. GIBSON'S STATUE OF THE QUEEN has arrived in England; it is of colossal size, and is intended for the Queen's robing-room in the palace of Westminster. We have not yet had an opportunity of seeing it; but report says that although in many respects it is a grand and dignified work, its resemblance to her Majesty is not so happy as her loving liege subjects must desire to see. The apartment in which it is destined to be placed is not, moreover, the most suitable for a work of this character; it is too small for a statue of such proportions.

PRESERVATION OF WOOD CARVINGS.—At the last meeting of the Institute of Architects, Mr. W. Rogers exhibited some specimens of Gibbons' carving, from Belton House, Lincolnshire, and gave the following explanation of his method of

strengthening and preserving the parts remaining, after the lime-tree wood of the interior had been reduced by the worm to a mass of honeycomb fibre. Photographs of the carvings were taken before the ornament was removed from its place: the wood was well saturated with a strong solution of corrosive sublimate to destroy the worm (the natural colour was afterwards restored by a further chemical process), and strength was then given by injecting vegetable gum and gelatine: the separate pieces were afterwards put together according to the original design preserved in the photograph, restoration with new work being as much as possible avoided. Mr. Rogers stated that similar carvings at Burleigh, Chatsworth, Petworth, Cashiobury, Hampton Court, Windsor, Trinity College Cambridge, and other places, are in the same state of decay, the surface or skin being covered with a deceptive vegetable bloom, which assists in completing the work of destruction. It is desirable that these should be examined forthwith. We shall enter upon this subject at some length in our next number.

THE PAXOPICON.—Several improvements have been made since we last noticed this place of intellectual amusement. The concert is much better conducted, and the singers more artistic. Mr. L. S. Buckingham has added two amusing narratives, for the holiday visitors, in his tales of "Whittington and his Cat," to which he has ingeniously added "Pass in Boots," as the further adventures of the cat after Whittington's marriage, which ends the old story. The tales are redolent of jest and fun, and are illustrated by illuminated pictures, many of which are clever as works of Art; while all have been much improved by a more powerful light than has been hitherto adopted for their details.

THE ARTISTS' AND AMATEURS' CONVERSATION.—The first meeting of this society is advertised to be held at Willis's Rooms on the 24th of January, after our sheets have gone to press; the others are advertised for February 1st, March 13th, and April 17th. The Society is established on principles similar to those of the elder institution, the "Graphic," and is supported by a number of artists and amateurs of celebrity. We shall report in our next what was to be seen on their first night of meeting for the season.

AN IMPERIAL ALBUM.—We stated some time since that the Emperor of the French had commissioned several artists of the country to execute drawings in water-colours, illustrative of the Queen's late Visit to France. These drawings have now been collected, magnificently bound as an album, and forwarded to Her Majesty as a "Christmas-box" from the Emperor. The principal scenes on which the pencils of the respective artists were employed, are the following:—the "Arrival at Boulogne," by M. Morel Fatio; the "Departure from Boulogne," by M. Mozin; the "Ball at Versailles," the "Imperial Supper," by M. Guérard; and the "Arrival at St. Cloud," by M. Eugène Lami. The cost of the present is estimated at 1000 guineas.

THE QUEEN'S PRESENT TO MISS NIGHTINGALE.—The design of the jewel is admirable, and the effect no less brilliant than chaste. It is characteristic and emblematic, being formed of a St. George's Cross in ruby-red enamel on a white field, representing England. This is encircled by a black band, typifying the office of Charity, on which is inscribed a golden legend, "Blessed are the merciful," of course, in allusion to the merit of Miss Florence Nightingale, the recipient. The Royal donor is expressed by the letters "V. R.," surmounted by a crown in diamonds, impressed upon the centre of the St. George's Cross, from which also rays of gold emanating upon the field of white enamel are supposed to represent the glory of England. Wide-spreading branches of palm, in bright green enamel, tipped with gold, form a framework for the shield, their stems at the bottom being banded with a riband of blue enamel (the colour of the riband for the Crimean medal), on which, in golden letters, is inscribed "Crimea." At the top of the shield, between the palm-branches, and connecting the whole, three brilliant stars of diamonds illustrate the idea of the light of Heaven shed upon the labours of Mercy, Peace, and Charity, in connec-

REVIEWS.

TAM O'SHANTER. By ROBERT BURNS. Illustrated by JOHN FAED, R.S.A. Published by the Royal Association for Promoting the Fine Arts in Scotland.

This edition of Burns's well-known humorous poem is the gift of the "Royal Association for the Promotion of the Fine Arts in Scotland," to their subscribers of the past year, and a gift it is which Southern as well as Scotchmen must value, although we are not quite sure that this poem has been judiciously selected for the purpose intended; something more refined in character would have been better adapted for the majority of those who usually subscribe to such societies. It contains six highly finished line engravings, the dimensions of each being about six inches by nine, by Mr. Lumb Stocks, A.R.A., and Mr. J. Stephenson, from pictures by John Faed, R.S.A., an artist as well appreciated on this side the Tweed as on the other; and a pretty vignette of Tam's place of residence, the auld town of Ayr, engraved by W. Miller. The first engraving is O'Shanter's "sulky, sullen dame," waiting his return, and "nursing her wrath to keep it warm." The gude woman and her cat occupy respectively one side of the fire-place, the tea is still brewing in the chimney corner, but it is quite evident it will not be offered to Tam very graciously when he reaches home; there is a storm brewing inside the cottage as fierce as that which he encounters without. The second plate "The Souter tauld his queerest stories," is a capital composition, full of genuine hearty humour that Wilkie would not have disowned. In the next, Souter Johnny, whom Tam "loed like a vera brither," is helping him to mount his grey mare Meg, for

"Nae man can tether time or tide,
The hour approaches Tam must ride."

The lightning darts across the blackened heavens, but he is too happy to notice it or be alarmed at its appearance. The fourth plate is very clever, but the subject is not agreeable, the "unco sight" in Kirk-Alloway, and there is an absence of delicacy in its treatment, which we think might have been avoided. In the fifth plate, illustrating the lines

"And scarcely had he Meggie rallied,
When out the hellish legion sallied,"

warlocks and witches, and the hideous forms that have been skirling in the old church, rush out of the open window to catch the traveller; there is great spirit in this composition, and the light and shade are so managed as to produce a powerful and startling effect. But no one of the subjects evinces more talent than the last, where Meg has just reached the "key-stane of the brig;" the mare, her rider, and their pursuer are admirably drawn; often as this subject has been illustrated, we have never seen it more forcibly represented than here, the conception and the execution are alike entitled to our highest praise.

LONDON IN THE OLDEN TIME: a Topographical and Historical Memoir, accompanying a Pictorial Map of the City as it existed in the reign of Henry VIII. By WILLIAM NEWTON. Published by BELL & DALDY, London.

The history of the metropolis of England has been frequently attempted, with more or less success, since the days of John Stow, to whose ill-requested labours we are indebted for all we know of its ancient aspect. Hence, while our topographical literature lasts, his work will be quoted as forming the grand basis upon which other writers build. Fitzstephen's narrative of the doings of the Londoners in the twelfth century, when he lived among them, though very curious, is but the brief record of a period when London was rivalled in size and importance by other of our cities. Pent up within the boundaries of the old Roman wall, its citizens could emerge from the gates to ramble in the fields around them—fields so completely unaltered by sanitary commissioners, that the undrained morasses of Finsbury and towards Stepney were looked upon in the light of defences to protect the walls; and the men of Essex had to turn out and construct raised causeways on great occasions, when sovereigns had their public receptions at the Tower, or marched into London at the head of their victorious soldiers, as Henry V. did after the battle of Agincourt. The sovereign could readily kill a stag in the dense forests of Epping, or nearer still, at Islington or Marylebone, enjoy his sport. The north of London was, in fact, thickly covered with trees; and here and there were religious establishments planted in proximity to the town, to which the pious could walk to their orisons, or the sick to the healing waters of some holy well, like that

of St. Clement, which still gives its name to a street anything but redolent with health at present. Even so short a time ago, as 1825, when Hone was publishing his "Every-day Book," St. Chad's Well, in Gray's Inn Lane, was in existence as a healing spring; while the anciently-famed St. Agnes-le-Clair still exists in Hoxton, to which citizens often resorted in old times across the pleasant fields of Finsbury, left for ever "for the maidens of London to dry their clothes in," as the old ballad veraciously informs us; and where the youth of London practised archery, like so many Robin Hoods. Pleasant enough is it, to read in old records the rural attractions once displayed, where now all is dirt and squalor; to be assured that Saffron Hill, that most offensive collection of bone-boiling, horse-slaughtering, and chemical establishments, surrounded by dense masses of undrained alleys, and the resort of poverty, dishonesty, and vice, was once a rising ground overlooking the pure Fleet River, and had its name from the abundance of saffron flowers which covered it, and gave a golden hue to the fresh fields around; so that the lane leading thereto on the north side of Holborn was called Gold Lane in consequence. Or that the now equally abominable Petticoat Lane, in Houndsditch, was, a few years before the time of Queen Elizabeth, a rural way, bounded on both sides by hedgerows of elm-trees, with foot-bridges and convenient stiles to pass over into the pleasant fields "very commodious for citizens to walk, shoot with bow and arrow, and otherwise to recreate and refresh their dull spirits in the sweet and wholesome air."

When Elizabeth and James I. troubled themselves exceedingly at the increase of London, and their parliaments anxiously enacted laws to prevent country gentlemen from coming there, lest the "decay of good housekeeping," as it was termed, should ruin the country, how little did they think they were merely enacting Mrs. Partington, and trying to sweep back the sea from their doors; could they see what London has now become, and how gradually it has swallowed within its bounds the neighbouring villages to which, in their time, it was dangerous to travel after dusk, there is no doubt their nerves would receive an awful shock. They might, however, recover, when they found the country really not ruined thereby. Yet marvellous as was the rapidity with which London enlarged itself, when peace and religion was established by Elizabeth, it is as nothing compared to the steady growth of the last fifty years. We, therefore, owe a debt of gratitude to those who have preserved the ancient features of the past times, whether by pen or pencil, to aid us in the present. Mr. Newton says in his preface, with great truth, that the advantages a good map of the metropolis in the old time would present to the archaeological student is great, and that this suggested to him "the idea of collecting, from the many available fragmentary records of the metropolis, materials for representing the ancient city in a graphic form."

This has been effected by a general bird's eye view or pictorial map of the cities of London and Westminster, the borough of Southwark, and such other detached hamlets having immediate connection therewith, as they existed in the reign of Henry VIII. To do this it has been necessary to consult the descriptions of old authors, as well as the maps and plans of previous times. Two of the most important works of this kind are the views by Anthony Van den Wyngaerde, A.D., 1543, in the Bodleian Library, and the large print by Radulphus Aggas, 1560; both being similar views to the present, as if in fact sketched from a balloon. From the latter has been drawn, until recently, our only views of buildings before the time of Hollar, or the days of the Great Fire; but, as Mr. Newton observes, this work "is extremely rude in delineation, and sadly distorted as to proportionate distances," although "acknowledged to exhibit with tolerable accuracy the principal places existing in and about London" at the time of its construction. It has, however, been quite possible to restore very accurate representations of old buildings; for, though thus rudely indicated, it is possible to comprehend what they would be if better detailed. Herbert, in his "History of the Livery Companies of London," was one of the first to attempt such restoration, and he succeeded well. The present map has been constructed similarly, aided by various plans made when there were considerable vestiges of early buildings since destroyed; such as that done by order of government after the great fire, and Roque's survey in the beginning of the last century.

There, however, existed many buildings which were not delineated by the pencil, though carefully done by the pen; and it is from the descriptions of ancient writers, aided by cognate examples of

tion with the glory of a nation. On the back of this royal jewel is an inscription on a golden tablet, written by Her Majesty, which stamps upon it a value inappreciable, as recording it to be a gift and testimonial in memory of services rendered to her brave army by Miss Nightingale. The jewel is about three inches in depth by two-and-a-half in width. It is to be worn, not as a brooch or ornament, but rather as the badge of an Order, the most precious from the manner of its conferring—the most singular in the merit of its receiver—the most illustrious in honour that has yet issued from the fountain of all honours—the Crown of England. We believe the credit of the design is due to the illustrious consort of Her Majesty, and we understand that it was manufactured by Messrs. Garrard, the Crown Jewellers. This graceful gift will mark an era not only in the history of the country but in the records of women.

LECTURES ON ARCHITECTURE.—The Gallery of the Society of British Artists, in Suffolk Street, is at present converted into an occasional lecture room. A course of lectures on Architecture was commenced there last month; the syllabus announces them to be "On Ancient Assyrian Architecture," by Mr. James Fergusson. By the way we have two recently published volumes on Architecture, by this gentleman, now lying on our table for review, a task which we hope to accomplish at some length next month. "On Early Christian Art," by Mr. George Scharf, Jun.; and "On the Influence of Light and Shadow on Architectural Exhibition," by Mr. Thomas Allom.

THE LONDON STEREOSCOPIC COMPANY.—At No. 54, Chapside, we have had an opportunity of inspecting various series of the most beautiful photographs, artistically considered, we have yet seen. The works by which we were most interested were large groups of flowers and fruit, all apparently photographed from Nature, and relieved by a light open background, as if some plain white field had been placed behind the group. Many of the bouquets were beautifully fresh even without colour, as those of roses, dahlias, hollyhocks, convulvi, and especially those which are distinguished by any picturesque luxuriance; the groups of growing fruits and flowers were not less attractive—apples, grapes, pears, plums, and currants, each mingling with their respective leaves, so as to constitute a picture. The photographer is, we believe, Adolph Braun, many of whose flower-compositions were engraved in this Journal some years since. Most of these pictures would serve most perfectly to paint from; but while considering them as auxiliaries, we cannot help regretting that photography so imperfectly affords the darker gradations and reflected lights in which we still see characteristic detail in Nature. Besides these large photographs there are, moreover, innumerable stereoscopic views from subjects in the Crystal Palace, in the French Exhibition, and in almost every one of the principal cities of Europe. There are also some costumed figure groups arranged with much skill and taste. The exhibition, we believe, is open to visitors.

THE SURREY GARDENS' COMPANY AND MUSIC HALL.—A prospectus has been issued of a company under the Limited Liability Act, with a capital of 40,000*l.* in 10*l.* shares, to be called the Surrey Gardens' Company, for leasing the Surrey Zoological Gardens, and building a music-hall capable of accommodating 10,000 persons, and at a cost of 40,000*l.*; the usual open air entertainments likewise to be continued, and M. Jullien to be engaged. Shareholders are to be offered the privilege of a personal ticket in lieu of participating in the annual profits. It is contemplated that the music-hall shall be available for public meetings, floricultural and horticultural exhibitions, and other general purposes.

THE DUKE OF RUTLAND has, at the request of his tenants, consented to sit to Mr. F. Grant, R. A., for his portrait. The picture, when completed, will be presented to his Grace as a memento of the respect and esteem in which he is held by the donors, who are also desirous of possessing a likeness of the Duke, for which purpose the portrait will be engraved.

similar foundations, that the designer of the present map has restored them. "It has been a prominent object of this work to point out, as correctly as may be, their true situations; and in most instances, if not all, it is believed that their position, extent, and general appearance, at the period assigned to our map are rendered with fidelity." Such are the words of Mr. Newton, when speaking of his own labours, which appear to have been honestly and anxiously performed. The task has been one of some difficulty, and required much patient research, but it bears internal evidence of having received it at his hands. It may be objected that fancied views of places are calculated to injure the *craieusement* of the work, but it must be borne in mind that the small scale on which the buildings are necessarily laid down, does not at all effect the general appearance.

The map measures three feet nine inches each way, and has been most elaborately engraved by Thomas Sherratt. It wants, in fact, the aid of a glass to fully comprehend its minutiae. Its great value is in the truth of its proportions, in which all the olden maps fail. As a piece of London topography, it is a welcome addition; and the attempt to restore such buildings as belong to its history, and many of which exist only in ancient descriptions, will aid at any rate the clearer understanding of the incidents narrated by early chroniclers.

The map is accompanied by a brief, but clear exposition of the state of the metropolis at the early time chosen for this view; and we consider this as a most valuable adjunct, comprising 117 closely printed folio pages, minutely detailing the various buildings existing in London and the suburbs before the Reformation, as described by old authors. We know of no better digest than this, by which we may, in imagination, walk over the London of the sixteenth century. If Mr. Newton had done no more than this, he would have done good service to topography. Both map and letter-press bind together in a thin folio volume, the map being mounted on linen; and it therefore ranges with such books as Strype's edition of Stow, to which it will be a welcome addition, as it will also be to the library of the English topographer and historian.

AN ADDRESS DELIVERED IN THE CRYSTAL PALACE, ON NOVEMBER 3, 1855. By M. DIGBY WYATT, Published by BELL & DALDY, London.

We had the gratification of hearing Mr. Wyatt deliver this lecture, or address, at the opening of the Exhibition of Works of Art belonging to the Arundel Society; and, while listening to him, could not but regret that his audience was comparatively scanty, for the day happened to be miserably wet and cold, and the visitors to the Crystal Palace were few indeed. Our regret is now partially lessened by seeing it in print,—we say "partially," because, in order to estimate rightly its value, the reader should have before his eyes the traces and drawings from paintings by Giotto, and other early Italian artists, which hung on the walls of the court where the audience assembled, and which works of Art the address was intended to explain. Mr. Wyatt's profession of ornamental artist has led him to the study of early Medieval Art, and the knowledge thus acquired enables him to handle the subject learnedly, while he discourses upon it without pedantry or dryness.

WOMAN'S RECORD: SKETCHES OF DISTINGUISHED WOMEN FROM THE CREATION TO 1854. By MRS. S. J. HALE, New York. Published by HARPERS, BROTHERS.

A second edition of Mrs. Sarah Hale's monster Biography of Celebrated Women proves the interest which our transatlantic neighbours took in the first—indeed everything appertaining to *women* finds a ready sale in America—and while Mrs. Hale has rendered the homage of her heart and pen to many well-known and right honourable women, she has filled some niches in her temple of fame with names hitherto unheard-of in Europe. In such a vast undertaking the wonder is not that Mrs. Hale has made some mistakes, both in her details and conclusions, but that she has made so few. The labour of such a compilation must have been immense.

The work is printed in double columns, and extends to 812 closely printed pages; this might have been profitably reduced to six hundred. Mrs. Hale has given specimens both in prose and verse from several whom she considers the best authors; some of these quotations are not worth the space they occupy, but where an effort was made to include all distinguished women "*from the creation*," we imagine Mrs. Hale found as much difficulty in leaving out as in putting in. The volume is divided into four "*eras*," but it is im-

possible to dispel the mists which envelope individuals of bygone ages, and the interest of the book does not really commence until the "*second era*."

In these days of cheap and easy literature we are startled by such a levianth of a book as this which Mrs. Hale has wafted across the Atlantic as if it were one of the volumes of "*light literature*;" but in America the thirst for Biography is unquenchable, and gratified at any cost.

The volume is abundantly illustrated by engravings on wood, portraits of those considered most worthy of such a compliment, and in some instances the likenesses are correct. Mrs. Hale has taken great pains to correct former mistakes; but writing as she does at the other side of the Atlantic, she is in a great degree unable to ascertain if the information she receives is really correct. She says for instance that Mrs. S. C. Hall has frequently illustrated the labours of Mr. S. C. Hall's pencil, by her pen—it is pretty well known here, that Mr. Hall is a barrister, not an artist, and that he never wielded a pencil except to "*make a note on't*." But as we have already said, it is only to be wondered at, that so few mistakes have been made where such a mass of varied materials were to be collected and arranged.

The work is really one of great utility, and we consider ourselves fortunate in its possession.

THE ALMANAC OF SCIENCE AND ART, A.D., 1856. Published by CHAPMAN & HALL, London.

A work of this kind has long been wanted; it will fill a vacuum which every one, either directly or indirectly connected with Art, must have experienced. The information it contains is ample and well arranged; besides the usual contents of an almanac, it sets forth all one desires to know respecting the artistic and scientific institutions of the metropolis, the provincial schools of design, public institutions, libraries, and museums, a list of the prizes awarded to English exhibitors in the recent French Exposition, the acts relating to the registration of designs, &c. &c.

NOLAN'S ILLUSTRATED HISTORY OF THE WAR. Published by VIRTUE & Co., London.

We have already noticed the first three parts of Dr. Nolan's history of the contest in which the Western Powers are unhappily engaged with Russia; the seventh part brings down the narrative to about the period when the allied forces had established themselves in Bulgaria. It must not, however, be thought that this history is a mere record of the movements of fleets and armies, and of the actions in which both sides have displayed so much courage, though not resulting with like success to both; the author enters at considerable length into the political and social condition of the various countries which have become the seat of war, and hence a value is attached to the history far beyond that pertaining to the mere historian of battles. Dr. Nolan writes lucidly and graphically, and when the occasion demands it, with energy and eloquence; he will have scope for the display of these latter qualities when he gets into the thick tempest of the war; at present he sees only the gathering clouds, and feels the drops, few and far between, that presage the coming storm. We fear events are not progressing in such a way as to compel the author to bring his narrative to a speedy conclusion, but whether he lays down his pen early or late, his history will certainly furnish the best report of the contest that has appeared since hostilities commenced. We must not omit to mention that each published part contains a portrait of one of the distinguished warriors of the allied forces, and an illustration of a battle, or some place rendered notable by its connection with the war; all exceedingly well engraved.

SALTAIRE. Drawn and engraved by W. WILLIS. Published by A. HOLROYD, Bradford.

If we could topple down the two tall chimneys that rise from the roof and at the side, respectively, of the vast pile of buildings standing in the centre of this engraving, we might, without much stretch of fancy, imagine we had before us some noble royal, or ducal residence, in which a host of personages of high degree, with their retinues of serving men and serving women might be lodged and entertained. But it is destined for a different purpose; over that elegantly-constructed bridge, and beneath that decorated archway, hundreds of industrious artisans throng, we presume, to their daily avocations; for the vast edifice is neither more nor less than one of those immense factories with which the midland counties are studded. This view of Saltaire, which includes the village of that name contiguous to the "*Works*," is taken from Shipley

Glen, situated at Airdale, in Yorkshire. The owner of the property is Mr. Titus Salt, who must have expended large sums to make it as it is represented in this well-executed engraving, which recalls associations of another kind—the strong baronial castle of feudal times, round which were clustered the humble abodes of those who found protection and support under the wing of its owner.

THE HISTORY OF SIR THOMAS THUMB. By the Author of "*The Heir of Redcliffe*," "*Hearts-ease*," &c. Illustrated by J. B. Published by CONSTABLE & Co., Edinburgh; HAMILTON, ADAMS & Co., London.

This is not a biography of General Tom Thumb, whose appearance in England some time since, under the auspices of Mr. Barnum, created so great a sensation throughout the country, but of Tom Thumb whose history has belonged to half the nations of Europe for centuries; for Germany, France, and Denmark each has its Tom Thumb, though not quite the same as the hero of King Arthur's court. The Author of "*The Heir of Redcliffe*" has concocted a very amusing tale out of the old legend which children love to hear and talk about, and has made it a text for inculcating a lesson of right conduct; how the young should endeavour to choose what is good, and avoid the bad in every transaction of their lives. The illustrations are not quite up to the mark of the present day, even for a child's book; but the volume would still be a pretty gift to little folk.

THE NEW SCHOOL OF SINGING. By ROBERT FRANÇOIS BLACKBEE. Published by CRAMER, BEALE, & CHAPPELL, London.

The very sensible objects of this publication are to prevent the premature cultivation of the voice, and to moderate the excessive practice of difficult exercises. We are not sufficiently skilled in the subject to pronounce if Mr. Blackbee's plan for the *crescendo*, or drawn tones, will be found more useful than the ordinary system of commencing at once with the practice of long *crescendo* notes. It is frequently the case that the pupil in beginning a note very piano, for the purpose of making the *crescendo*, is seized with a nervous shrinking in the chest, and loss of power over the muscles of the throat, and the sound necessarily issues in a stilled and tremulous manner; if Mr. Blackbee has overcome this difficulty he has achieved a great triumph. But whether or not, there is much in his method which is worthy the attention of teachers as well as of pupils.

PUSS IN BOOTS. By OTTO SPEEKTER. Published by J. MURRAY, London.

John Murray, of Albemarle Street, publishes "*Master Cat and Puss in Boots*;" it is even so, but then it is Otto Speekter's "*Puss in Boots*," and that is very different from any "*Puss*" hitherto submitted to the "*intelligent public*." We recommend this especial "*Puss*" to the drawing-room quite as much as to the nursery; the illustrations are so full of character, the drawing of the figures so unexceptionable, that "*well-grown*," well-educated people will find quite as much delight therein, as the juveniles to whom "*Puss in Boots*" of right belongs.

PROFESSOR EDWARD FORBES, F.R.S. Engraved by C. COOK, from a Daguerrotype by CLAUDET. Published by A. CLAUDET, London.

An admirable likeness of one whose early death is almost an irreparable loss to the world of science. This engraving, very carefully executed on steel, in the mixed style, is, we presume, copied from the same daguerrotype as was the lithographed portrait prefixed to the published volume of the professor's literary essays: in both, the highly intellectual countenance of the original, and its kindly and benevolent expression, are well preserved.

THE CHESS-PLAYERS' ANNUAL for the year 1856. Edited by CHARLES TOMLINSON. Published by A. HALL, VIRTUE & Co., London.

The "*Game of the Chess*," as Caxton titled his earliest printed volume, has for ages been a favourite study and pastime with men of all ranks and all degrees of intelligence. To those who interest themselves in this noble game Mr. Tomlinson's Annual will be most welcome; it is filled with pleasant stories, essays, dialogues and poetry, anecdotes and aphorisms, and all sorts of entertaining contributions to excite the attention of the chess-player.

THE ART-JOURNAL.

LONDON, MARCH 1, 1886.

STUDIES FROM THE LIFE,
BY W. MULREADY, R.A.

HE processes of study by which eminent results are effected have a peculiar interest. It is a privilege to become acquainted with them. It is, as it were, being introduced behind the scenes of a drama presented to the public. To be informed of the mode of acquirement of the man of science or literature, to be shown the steps by which a great invention has been reached, or a secret of nature discovered, or to trace in a first sketch the germs of a poem, or a biography, or a history which has afterwards expanded into a standard work, is a grateful boon. In the province of Art it is no less delightful to witness the methods by which analogous successes have been achieved, and to be instructed in the processes by which such results have been arrived at. To the merely intelligent curious, and to the general Art-lover, this is full of interest; but to the student it is also full of instruction. These are the considerations that invest the collections of sketches, drawings, and studies of the Old Masters with their chief worth. The "Liber Veritatis" of Claude; the first thoughts and studies of Raphael, Michael Angelo, and Albert Durer, from these views derive their liveliest interest. To examine such is like a visit to the atelier of the artist himself, where you do not see him in the full array of honour with which time has invested him, but in his morning gown and slippers, palette on finger, brush in hand, the anxious student of the beautiful, the poetical, the eager enthusiast fluctuating between shortcoming and success, and trembling on tiptoe for yet higher flights! He appears himself to point out to you the successive images and phases by turns selected, that have past over the vision of his thoughts, and how here he has changed a group, and there a figure, and how a drapery, or a limb, or a turn of a head or hand has been readjusted, and how the first sketch from the living model has been prepared for transference to the canvas or fresco by doubled and trebled lines of correction or refinement, until it has been at last gifted with a contour fitting it for the great work itself. Thus may we sometimes trace in the collections of sketches, in the Louvre and elsewhere, a great and cherished work of Art from its cradle to its manhood. Earnest, indefatigable, devoted, is the scene of study thus displayed; no easy road to fame is there illustrated, but one of studious habits and untiring zeal—the path of those

"Who spurn at ease, and live laborious days."

In no class perhaps do the early habits of study cling more affectionately and enduringly than in that of the artist, in which we may so frequently notice the same earnest methods which characterised the young aspirant still practised in matured age. We need not go back to former times—to the days of Lorenzo de' Medici, or Pope Julius, to find subjects for our admiration,

either of these methods or their endurance—nor wander beyond our own familiar names. Wilkie, Flaxman, and Etty were a worthy trio of examples of enthusiastic and enduring study, and of the excellent success it achieves. The crayon and the brush were ever zealously employed by them in preparatory studies for their works and compositions, and the most earnest search after truth is evidenced in the conscientious readings of nature in their sketches. The loss, however, of these great ones from among us, does not leave us bare of present wholesome examples.

The remarkable studies from the living model executed by our well-known academician, William Mulready, in the simple materials of black and red chalk are indeed not to be surpassed by similar productions in ancient or modern times. We are sufficiently conversant not only with ancient studies, but also with those of modern schools, to say this without hesitation; and we add that in perfection and completion they are not equalled by the crayon drawings of Wilkie, and in refinement do not fall behind those of Flaxman. It would indeed be stopping short of the full impression these works make on us, did we not avow that, take them for all in all, as simple black and red crayon drawings from the life, we do not know their equal either in ancient or modern Art. This is a proud boast for us to be able to advance, in a province in which our strength is said not to lie. The faithfulness and delicacy of these drawings, their detail and yet their breadth, their finish and completion of effect, are hardly to be surpassed by a picture in oil. They are executed by the artist however as a *délassement* from his works of the latter nature, so deservedly high in public estimation. The crayon comes in occasionally as a relief to the brush, and fills up the time probably while some portions of the picture on the easel are drying in readiness for another day's work; and thus are completed every year some three or four studies, which have had their birth in the life-school of the Royal Academy.

Among the benefits afforded by this body to the furtherance of Art, out of the funds arising from their annual exhibition, is a school for drawing, painting, and modelling, from the living model, and it is one of the duties of each Academician in turn to take the direction of this school, which is held in the evenings of a large portion of the year, and to pose the model for the students to copy; and not unfrequently are these and the director seen all drawing together with like attention and earnestness. Studies so complete, however, as those of which we have been speaking, are not to be executed during the short period allotted to each pose—not, we believe, more than the evenings of one week—but in Mr. Mulready's case are taken home and completed by daylight, in his own atelier, but still "by nature;" and thus their character as studies remain intact, although daylight enables them to be enhanced by a juster and more complete gradation of tint and light and shadow, than the gaslights of the Academic School afford.

At the first sight of these works it is hard to believe, not only by the uninitiated, but by those also conversant with Art, that such effects can be produced by such simple agents. The tint of the paper usually chosen for them, is slightly yellow, and the drawings are wholly made in red and black chalk—the paper itself being left for the lights—without any white being used. This is the usual method; in a few cases we believe a slight addition in material has been used; but the most remarkable of these works have been produced solely with red and black chalk, without anything else entering into the process. The results are most satisfactory from the use of this very sober key of colour:—the slight yellow of the paper, the red and the cold shadow of the black chalk supplying a subdued version of the three primary hues of Nature. The variety of the tints on the surface of the drawing produced by the different intermixture and preponderance of the elements of this simple scale, is marvellous; and the success

achieved by them in that most difficult portion of the painter's art—the representation of flesh—must be seen to be credited.

It may be, also, that this illustrates in an interesting manner the subject of Ancient Greek Painting, of which we possess no adequate remains. Excellent as were the architecture, sculpture, and formative decoration of that people, it has been asserted that the standard of these could have been reached by them in the kindred Art of Painting, from the great simplicity and fewness of their pigments, of which we have record. Due consideration would doubtless be unready to allow that those who showed such extreme refinement and fastidiousness in the sister arts would ever have been satisfied with crudities in painting, or valued so greatly productions that were incomplete; and these studies of Mr. Mulready appear to illustrate this, and justify the reputation of the artists of old; for here we now see all the hues of flesh produced by agents still more simple than those possessed by Apelles, Protogenes, &c. And thus does modern Art illustrate the old, and Bayswater throw back a ray of light on Athens!

"Studies" may be divided in two sections; the first comprising those which are direct preparations for pictures, as trials of composition in line or effect in light and shadow for the whole; or sketches for portions, as for individual figures, or for the principal heads or hands, &c.; and the other those that are not direct in their connection with any principal effort of the artist, but rather such as aim to forward his general knowledge, or refresh his memory of nature. The more ingenuous and earnest the followers of Art, however far back may be the date at which they entered her service, ever class themselves as still among her *students*; as indicated by the well-known reply of the ancient Michael Angelo, when discovered by his friends among the ruins of the Coliseum. Other people cling to youth; but to the poet and the artist youth may itself be said to cling, from the enduring freshness of their appreciation for the beautiful. Sparkling are the goblets they dip out from the well of truth. Vivid are the pictures they reflect from their mirrors, and deservedly cherished is an artist's direct transcript from nature; begun, perhaps, without knowing whether he is to make of it a painting, or only a study. We use the word "only" as no depreciation; for there is indeed a charm about an actual "*bona fide* virgin study" peculiar to itself. Some of the most exquisite of the sensations experienced by the true Art-lovers are those derived from the perusal of sketches, from fact, on the spot, photographed by the artist's own perception and so imbued with himself—nature—but seen through his eyes. There is somewhat sacred in such fresh offerings: we do not like them to be touched. "Paint pictures from them if you like, but do not touch these," we feel inclined to exclaim.

Of either of these classes of "studies," the direct (or shadowing forth of the future picture), or the indirect (the more close transcript of nature's facts), the "pleasant labours" of Mr. Mulready afford eminent and charming examples; but it is to the latter (those "studies from the life," in which are united the zeal of the young student with the most experienced taste and knowledge) that our eyes are now turned.

Charming as these are as works of Art for the connoisseur and collector, they are, as we have said before, still more valuable as works of example and guidance to the student. Every School of Art throughout England should have the opportunity of witnessing and consulting them; and it is not one of the least judicious of the acts of the Board of Trade that they have ensured for their own Art Department, four we believe, of these works. Her Majesty also is, we understand, among the possessors of them, but on the whole they are confined but to few collections. Studies though they are, they are national credits, and go far to redeem us from any remarks on the shortcomings of British Art-acquaintance with the human form. They are most pleasing results of the union of truth and knowledge with grace and refinement, and are eminent examples of the gems to be found even on the footway to the heights of Art.

ON THE PERCEPTION OF COLOUR
IN PICTURES.*

THE following letter was printed for private circulation only; but the subject is of so much importance, and the remedy for the evil to which it refers is so clearly and simply set forth, that, considering the public should have the benefit of the writer's suggestions, we have obtained permission from Mr. Smirke to give them a place in our columns. It is, however, necessary we should explain that the pamphlet itself contains examples of the coloured papers Mr. Smirke recommends to be used: these we could not, of course, place before our readers, but they are sufficiently described to enable any desirous of trying the experiment to procure them.—ED. A.-J.]

DEAR SIR CHARLES,

It is with diffidence and hesitation that I address you on a subject which belongs rather to your Art than to mine: but the two domains adjoin, and the boundaries are not clearly defined; I trust, therefore, to your indulgence if I am found trespassing. No one can be more sensible than myself that, in making the few following observations, I am propounding to you no new doctrines, and am conveying to your mind no information. Yet, as the suggestion which forms the subject of these pages affects almost exclusively the interests of your Art, I feel that I am likely to obtain for it a more favourable and intelligent hearing through the medium of a letter addressed to yourself, than by the adoption of any other course.

Every one who has painted a picture, or decorated a room, or even furnished one, must have acquired some knowledge, however vague or defective, of the harmony and discord of colours, — of their affinities and contrast.

They must generally have felt that pink and green, or buff and blue, when placed in juxtaposition, present to the eye an agreeable impression, whilst orange and green, or green and purple, and other such pairs of colours, require some skill in the artist to prevent them from producing an opposite effect.

The fact is equally well known that, owing to this peculiar relation that colours have to each other, there is, in arranging a collection of pictures, an extreme difficulty in preventing their mutually injurious action on each other.

Few artists, I apprehend, have been so fortunate as not to have experienced, at some time, the vexation of finding their labours frustrated by an obnoxious neighbour; the Massacre of Innocents is, indeed, a tragedy annually, and almost unavoidably, acted, to the injury of many a good picture, and to the disturbance of many an even temper.

But the remark is by no means so trite, nor is the fact so generally familiar, that *the impression produced by a colour upon the eye does not cease immediately the eye is removed from the colour*; and it is to this fact that I would invite particular attention as forming the basis of the following observations, as well as of the suggestion which it is the object of this letter to submit to your judgment.

Do not fear that I am about to venture one step into even the shallows of science in this matter, or to inquire into the physical nature or causes of the impression made by colours on the retina. This fact, namely, that the impression produced by colour on the eye has a certain amount of permanence, and, for a time, affects its powers with reference to its appreciation of other colours, is all that I desire to have established; and this is very easily done by direct experiment.

Let any one fix his eyes, intently, for a short time upon a *bright red* object, and then let him turn to any ordinary historical or other picture, containing various colours, and it will be sure to appear to him wanting in warmth, whatever its colouring may be; for all the warm hues will

have temporarily lost their due effect upon his sense of sight.

Or let him look fixedly on pure *blue*, and he will be sure to find that, for a time, until his eyes have regained their normal condition, the complexion of every one around him appears sallow and leathery, not from any unnatural excess of sallow tints in the complexion, but in consequence of the abnormal condition produced upon his eye by the previous impression made on it by the pure blue.

The fact may be verified by a variety of similar experiments.

It is this phenomena, I apprehend, which contributes to render the task of hanging a collection of pictures so hopelessly difficult. We may place widely asunder two conflicting pictures, but we still cannot prevent their injuring each other, should the spectator happen, or choose, to cause his eye to pass from one directly to the other.

Suppose an eye that has been immersed in the flood of rich colouring presented by a Rubens or a Paul Veronese, were to turn, fresh from the dazzling draught, on to some tenderly and soberly painted picture, whose subject, perhaps, demanded the use of broken and subdued tints, the critic at once pronounces it to be feeble, faded, &c., whereas the verdict may have been far otherwise, had his eye been previously sobered down to its normal or neutral condition.

The greatest skill is often expended on the nice adjustment of hues. To balance, to neutralise, to contrast, to bring out, to keep down; such are the usual and laboured objects of a painter's solicitude. Sometimes an apparently unimportant object in the picture, a mere spot, as a red or a yellow cap, is thrown in to make peace, perhaps, between two rival hues, or for some such special purpose, placed with great caution, exactly in the right position, and exactly in the right quantity, so as to answer its purpose, and do no more.

Now, suppose we came up to this picture after the close examination of some pictorial conflagration, on which whole bladders of vermilion or chrome have been expended, how utterly unfit should we be to do justice to the painter's elaborate adjustments!

I may here be told that it is idle to complain of an evil that seems inevitable in every miscellaneous collection of pictures; but I trust that the suggestion which I am about to make may show that the evil is by no means irremediable; that, in truth, the remedy is simple, easy, and effectual.

Let any one who wishes to receive a full measure of enjoyment in a picture gallery hold in his hand a *tablet painted of a neutral tint*,* on which to rest his eyes as he passes from one picture to another. Has his eye become inebriated by some florid colourist? A draught of the neutral tint on his tablet will sober it down, and bring it to the full use of its senses. Has he been contemplating a glowing Italian sunset, or "A Masquerade at Naples"? a glance at his tablet will prepare him for the next picture, perhaps "A Mist in the Highlands;" by means of his tablet his eye becomes, on each occasion, a tabula rasa,—a cleansed pallet, prepared to receive a fresh assortment of colours. Its discriminating powers are restored; its bias corrected; and thus each picture will stand on its own merits, unimpaired by the disturbing effects produced by the impression left behind by the subject of the spectator's previous examination.

A late eminent medical writer on cookery recommended that a saline, or other appropriate draught should be administered to the cook on the eve of a banquet, so that his, or her, taste might be purified and rendered so sensitive as to secure to each *entrée* and condiment the exact flavour that shall best recommend it to the fastidious gastronomer.

Very analogous to this would be the operation of the proposed tablet upon the powers of the eye; it would "purge the visual ray," and so fit it to discern and appreciate the niceties of the colourist.

Indeed there seems a curious analogy in this

respect between our senses of sight and taste. Who has not experienced after indulging in food of luscious sweetness, that for some, not inconsiderable, time the palate is apt to misjudge all other tastes? Their minor sweetness is temporarily lost upon him. I would hardly have ventured to obtrude upon you this plain and somewhat homely truth, were it not, I think, an apt illustration of the analogy above mentioned, and did it not at the same time serve to explain the nature of the evil that the proposed tablet is intended to remedy.*

I would now advert to another application of the principle on which the proposed tablet is founded; and I think that this also is deserving of attention as calculated to enhance the enjoyment we derive from one of the most pleasing branches of the painter's Art. Landscapes almost always form a large proportion of every miscellaneous collection of pictures, and they are peculiarly liable to suffer by the contact of their neighbours. The landscape-painter is prone to use many greenish tints so remote from purity as to require an eye of some discernment to detect their greenness. Artists do this, because their mistress, Nature, does the like. In the cold grey of an early morning, or in the sere and yellow leaf of autumn, we have to seek for any green tendencies with a very careful survey—a survey which our visual organs are ill prepared to make with success, when fresh from one of those crashes of colour which one meets with occasionally in every assemblage of pictures.

Now, I would provide the means of obliterating these adverse impressions on the eye before turning to a landscape by painting the reverse of my tablet† with a deep, pure, but not bright, red.

Let the eye absorb a dose from this side before it contemplates a landscape, and it will be at once found to have been brought into a right condition for duly appreciating the artist's labour. Red offers so powerful, and yet so harmonious, a contrast to its complementary colour, green, that not only will the general effect of the picture be heightened, but every green tinge, however latent, however neutralised, will disclose itself with all the force due to it.

I can anticipate but two classes of objectors to my proposal. One would consist of those who think that it would be too troublesome to be required to stare at a blank tablet when the eye is eager to be engaged on some fine picture. But surely if the enjoyment of an intellectual pleasure be our object in looking at pictures, a few moments spent in adapting the eye to the task, and thus greatly enhancing that pleasure, is a sacrifice too trifling to object to. If our sight is imperfect, we do not hesitate to resort to the use of a glass; if our hearing fails us, we are too happy to avail ourselves of acoustic contrivances; and are thankful to science for the aid she affords us in our infirmities.

I need scarcely say, moreover, that the occasions for the use of this harmless *medicine for the eye* would not be of constant recurrence. There are in every gallery many pictures that are so neutral in their general effect that they are perfectly inoffensive to others, and are not themselves easily offended; and there are many wherein the interest or value of the work is wholly independent on colour.

When once the principle on which this tablet operates on the eye is clearly comprehended, every intelligent spectator would readily acquire the habit of determining for himself at a glance whether the recourse to it be necessary or not.

* The remark of Sir Joshua Reynolds on a peculiar effect on the eye, observed by him after having looked at white paper, is so apposite, that I think it well to transcribe the note referring to it in Malone's Life of Sir Joshua:—"On viewing the pictures of Rubens a second time they appeared much less brilliant than they had done on the former inspection. He (Reynolds) could not for some time account for this circumstance; but when he recollected that when he first saw them he had his note-book in his hand, for the purpose of writing down short remarks, he perceived what had occasioned their now making a less impression in this respect than they had done formerly. By the eye passing immediately from the white paper to the picture, the colours derived uncommon richness and warmth. For want of this foil, they afterwards appeared comparatively cold."

† A blank, tinted page stitched into the catalogue, when there is one, would of course answer every purpose.

* "A Letter to Sir Charles Lockhart Eastlake, P.R.A., suggesting a Mode of Assisting the Eye in the Right Perception of Colour in Pictures. By Sydney Smirke, A.R.A. Not Published. 1856."

* [The neutral tint paper which Mr. Smirke has inserted has a greenish hue.—ED. A.-J.]

To the class of objectors who may ignore altogether the existence of the evil which I propose to obviate, and who cannot perceive that one picture can have any material effect upon another, I can only reply that it is not for the use or benefit of such observers that I offer my proposals. I have no doubt whatever that there are those to whom this mutual action is imperceptible; to these certainly my expedient would appear to be of little value. The persons who are acquainted with the broad distinctions between red, blue, and yellow, are numerous; but were we to count up those who have learnt duly to appreciate, or even to perceive at all, the delicacies of distinction which exist in the wide range of mixed tints lying between those three extremes, we should probably find the number considerably reduced.

I venture to think that one of the advantages fairly to be derived from the use of such a tablet as I have described, would be, that it would assist in the education of the eye by leading it to acquire the habit of seeking out the niceties of the colourist's art, and might eventually confer upon them the capacity of looking at pictures with a keener relish, and a more just and critical apprehension of them.

Having laid before you my suggestion, I will trespass on you no further than to request your deliberate consideration of it and of its practical merit and application.

Should my opinion of the utility of this mode of rectifying our vision be so fortunate as to meet with the concurrence of yourself and of other high professional authorities, I shall indulge in the hope that the experiment may be tried, first in private collections, and ultimately perhaps in our public galleries.

I am, DEAR SIR CHARLES,
Very faithfully yours,
SYDNEY SMIRKE.

GROSVENOR STREET,
January, 1856.

BRITISH INDUSTRIES.*

NO. VII.—CLAYS, BUILDING STONES, AND MARBLES OF IRELAND.

ONE of the aims, and by no means the least important one, of the *Art-Journal*, is to direct attention to sources from which may be drawn objects for the uses of the manufacturer—and for the applications of Art. Notwithstanding the energy with which all our commercial enterprises are carried out—notwithstanding the zeal with which new mines of wealth are sought after, there still remains in the small group of islands which constitute the United Kingdom many undeveloped treasures of great worth.

The causes producing temporary blindness to advantages which are scattered around us, and which are consequently neglected, it is not easy to define. There appears to be a law by which matters are developed from time to time, but the operations of that law are hidden from us. Certain it is, that natural productions are known to exist at our own doors, for which our ships traverse the seas. The material is valued being "Foreign" which, when seen as a native produce is regarded as valueless. Certain it is that the mineral productions of Great Britain and Ireland, may, for all the purposes of use and ornament, endure a competitive examination with those of any nation of Europe, we may almost say of the whole of Europe itself.

We have already devoted our pages to the consideration of the marbles, serpentine, and other ornamental stones of England—and we purpose now briefly to direct attention to the lithological productions of the sister island.

A brief sketch or outline of the geology of Ireland will not be out of place. *Granite*, as the lowest rock of the series, claims our first attention. The principal localities in which we find granite forming the present surface, are those of Wicklow, of Galway, of Newry, and of Donegal. There are many other localities in which small isolated masses of granite are discovered, but those named are remarkable as exhibiting this formation, widely-spread, and varying much in character. *Mica-slate*, and *clay-slate* occur extensively. The former in Wicklow and Wexford, and the latter in Wexford, Down, Waterford, Cork, and Kerry. If we examine a geological map of the United Kingdom, it will be seen the geological formations of south-western England are all repeated in nearly the same order in southern Ireland. The slates, which are of the most varied character, constitute many of the more extensive mountain-ranges, but with the exception of the works in the Island of Valencia, and at Killaloe, they have not been made of any considerable industrial value. The quartz rocks of Mayo and Donegal, from the great extent of country over which they spread are objects of much geological, though as yet of small commercial interest. The sandstone, and the sandstone conglomerates of Ireland have received great attention; especially have they been studied by that eminent geologist, Mr. Griffith. These sandstone rocks are very widely spread. The Old Red Sandstone,—that storehouse of ancient life, which has been so graphically described by Hugh Miller, forms the greater part of the county of Cork; and in Longford and Roscommon it is also found largely developed. Limestones—the mountain and the carboniferous varieties—continually make their appearance in connection with the several geological formations already named. In the coal-fields, especially the Connaught coal-field—the carboniferous limestones exist, and yield for industrial purposes a great variety of building-stones and marbles. The magnesian limestone is found in the south of Belfast Lough. It is a true dolomite,—that is, a combination of one atom of carbonate of lime, and one atom of carbonate of magnesia—it sometimes occurs in proportions varying slightly from these. The more recent rocks are so unimportant, and occur in such comparatively small patches, that it is scarcely necessary to mention them on the present occasion. The igneous rocks—such as trap, basalt, and greenstone, in several varieties spread over the table-land of Antrim. All rocks of this character are remarkable for their chemical composition; being indeed often formed of fused masses of the adjoining rocks; and imbedded minerals in considerable variety are found in them. These rocks decompose with some rapidity, and form ochres and clays, distinguished from all others by the beauty and diversity of their colours. Such is a statement in general terms of the rocks which exist in Ireland.

Mr. Griffith, to whom Ireland owes a debt of gratitude for the careful study which he has given to the mineral productions of the country, informs us, that in nearly all the granite districts, beds are found of clays formed from the decomposed felspar, which are in few respects inferior to those discovered and worked so extensively in Cornwall. The coal-fields of Tyrone contain numerous beds of clay of the same general character as those which occur in the Staffordshire coal districts. The clay of Coal Island appears to be of much value; it differs, however, from the Stourbridge

clay, in containing some peroxide of iron, as the following comparative analyses will show:

	Coal Island.	Stourbridge.
Silica	46.2	46.1
Alumina	30.8	33.8
Peroxide of Iron	8.4	—
Potash	0.4	—
Water	14.2	15.1

Mr. Tighe made a statistical survey of Kilkenny, and he has well described the clay found in that coal-field.

The *Coal-seat*—that is, the underclay of the coal-bed—says Mr. Tighe, has properties which appear worthy of attention; it has been long used at Castlecomer for backs of grates, and is known to stand the fire in a remarkable manner. Mr. W. Davis, an architect who employed this clay largely, states that it will not only answer every purpose for earthenware; but "he hopes, also, that of pots for glass-house purposes, and being convinced of the great utility of the *coal-seat* in the fire, he made trials also of its utility as to external incrustations on walls, where it sets firmly, and he has every reason to think it will answer well;" he found, when properly prepared, that it would answer every purpose of *terras*.

This clay, in its natural state, burned in a strong fire, becomes white, and as hard as many siliceous stones. This *coal-seat*, or clay cannot, therefore, contain any iron, and it is stated, indeed, that analysis proves it to be precisely the same composition as the Stourbridge clay. The clay found near Howth is worked into crucibles by Messrs. Mallett, for various operation of their extensive foundry, and its quality is stated to be such as would render it excellent for delft and stone-ware. Little, if any, use has, however, yet been made of it beyond the crucible manufacture. Mr. Wilkinson, of the Poor Law Commission, made a large collection of the building-stones of Ireland, and made experiments on upwards of six hundred of the number. The details of these experiments have not been published, but in the "Industrial Resources of Ireland," the following general statements of the results are given. These are so important that we are glad to give them extended publicity, by publication in our Journal.

"The ordinary limestone of Ireland weighs in average per cubic foot 170 lbs. The average weight of water which is absorbed by immersion was one-fourth of a pound, the greatest absorption was one half-pound of water. The chalk of Antrim weighs 160 lbs. per cubic foot, and absorbs three pounds of water. The improved shaley calp weighs 160 lbs., and absorbs from one to four pounds of water per cubic foot. The average weight of sandstone is 145 lbs. per cubic foot; the extremes are 123 and 170 lbs. The absorption varies from nothing to upwards of ten pounds; the average being five-and-a-half pounds. Granites average per cubic foot 170 lbs.; its extreme weights were 143 and 176 lbs. The granite of Newry and Kingstown absorbs one-fourth of a pound; that of Carlow from one-and-a-half to two pounds; that of Glenties in Donegal four pounds. Basalt weighs from 171 to 181 lbs. per cubic foot, the average 178 lbs. It absorbs less than one-fourth of a pound of water per cubic foot. Clay roofing-slate weighs 174 to 179 lbs., in average 177; the absorption is less than one-fourth of a pound. The soft clay slates from Bauty absorb about two pounds of water.

In resisting fracture it was found that the slate rocks were the strongest, and of these some were stronger when the pressure is applied on the edges of the cleavage planes than on the faces. The basalts were

* Continued from p. 4.

next in strength; then the limestones; then the granite; and the weakest are the sandstones. Considered in relation to a crushing force, the basalts are found to be the strongest stones; next the limestones, and successively the slates and sandstones. In the different varieties of limestone, some of the larger crystalline stones, and the compact hard calp, are the strongest. The light-coloured crystalline stones of Ardbraccan, and those around Cork are the weakest. The Connemara white marble, or primary limestone, is the strongest that has been found.

Slate rocks of considerable value are found in Wicklow, near Rathdown and Glanmore. These are said, indeed, to be equal to the slates of Bangor in North Wales. The Killaloe slate-quarries are, however, the most extensive in Ireland; and from these, slabs of ten feet square are obtained. About 10,000 tons of manufactured slates per annum are produced from these quarries. The Valentia slates have been already mentioned. These do not answer for roofing-slates; but for flags a large quantity is annually sent to the metropolis. Slabs of Valentia slate are easily obtainable thirty feet long, four or five feet wide, and from six to twelve inches thick. The slates of the other districts are not of sufficient importance to require any particular description.

The Irish marbles have been deservedly well spoken of, and, curiously enough, but very sparingly developed. Throughout the length and breadth of the island, these limestone marbles occur to a greater or a less extent, but it is only in a few localities that we find them at all worked.

Near Galway, and at Kilkenny, the black marble is quarried. From Galway large quantities of this marble are sent annually to London and other parts of the kingdom; and much of it finds its way even to New York. Along the beautiful shores of Lough Corrib there exists an unlimited supply of this valuable ornamental stone. The Kilkenny marble is susceptible of receiving a very fine polish, and is, when cut, perfectly black; but the carbonaceous matter to which it owes its colour is acted on by light and air; and ultimately white marks of fossils, such as are peculiar to the limestones of Derbyshire and other places, make their appearance. Black marble is also found at Doneraile and Churchtown in Kerry, near Dunkerron in Down, and in Tipperary. A variegated marble, exhibiting red, yellow, and brown tints, with some beautiful impressions of fishes, is found at Armagh. Although this marble possesses peculiar beauties, except for small ornaments we believe it is little worked. Near Churchtown, in Cork county, a similar marble to this is found in many varieties, of which yellow and purple veins occur.

The Kilreea brown marbles are some of them very elegant. The dove-coloured marbles of Carrigaline and Castle Cary, where are also found ash-coloured and grey varieties, are susceptible of being formed into many articles of internal ornamentation; as are also the black and white, and the purple and white marbles of Churchtown in Cork. One of the most beautiful of the Irish marbles is the variety found in the islands of the river Kenmare, of a purple colour veined with a dark green; much of it appearing to resemble the serpentine rocks of the Lizard. The Kilkenny striped white and red marbles have been much admired. The Galway marbles—or, as it is also called, the Irish Serpentine—and the Connemara marble—which are of a finely variegated light green colour, are very much

esteemed.* The white marbles of these districts are sometimes very pure in tint, although much that has been sent into the market has had a greyish hue. If more extensive workings were instituted, and the blocks were obtained at greater depths than those which are now raised, there is every reason for believing that stones of far greater purity would be obtained. The exportation of these marbles from Clifden is large; but the trade is certainly capable of great extension.

The ornamental stones of Ireland are those which we have grouped under the general name of marbles. Many of the basalts, traps, greenstones, and granites, would, however, if properly worked, be found to be no less pleasing in appearance than the variegated limestones.

There is much difficulty in working many of these igneous rocks, owing to the want of any lines of cleavage or of bedding in them. This is one reason why many varieties of these stones, which are very rich in colour, have not been worked. We have, however, seen some very nice vases made out of the basalts of the Giant's Causeway, and small ornaments of great beauty made from the trap and greenstone rocks. The granites of Ireland are as worthy of attention as any which we are working in this country. From Penryn and the Cheesewring, in Cornwall; from Dartmoor, in Devonshire; from Aberdeen and Peterhead, in Scotland;—granite is sent, not merely to every part of the United Kingdom, but to the Continent, where the British granites are, for large works, highly valued. We know of no reason to prevent many of the fine granites of Ireland from coming into legitimate competition with those.

Some few attempts have been made at Florentine work in Ireland. Some examples which we have seen have been good examples of the art. In the south of Ireland many fine varieties of the malachites have been found, and those cut have furnished the green stones for the Florentine tables and tazzi alluded to. There would certainly be, under proper management, a large development of industry in these directions.

When we consider that Ireland possesses within the limits of her shores almost every geological formation from granite up to alluvium; when we examine and discover the immense variety of useful and ornamental stones which may be obtained from her rocks; when we reflect that nearly all the metalliferous minerals, the most valuable of iron ores, the most argentiferous lead ore, abundant and rich ores of copper, silver, and gold, are all to be found in considerable quantities, we cannot but regret that so small an amount of industry and intelligence has been expended in the development of her natural treasures.

ROBERT HUNT.

* Fine specimens of this material can be seen on the walls of the entrance-hall to the Museum of Practical Geology in Jernyn Street, which is now opened gratuitously every day except Friday. By the way, many of our readers will doubtless thank us for directing their attention to this Museum, which we believe is not so well known as it deserves to be, as a place of intellectual amusement and instruction. In it are exhibited the building-stones of the United Kingdom; and British marble and other ornamental works are shown in pilasters, panels, and pedestals. Among other interesting objects from natural materials, are tessellated pavements, casts from statues, tazzi in granite, alabaster, and Irish serpentine; objects showing the useful application of the sciences of geology and mineralogy; maps exhibiting the geological formations of the earth; and, in short, the Museum is full of what will enlighten and interest the intelligent visitor. At one end of the upper story is the laboratory in which all kinds of experimental investigations and practical analyses are carried on, and at the other end the Mining Record office, in which all the documents connected with the mining interests are deposited.—Ed. A. J.

THE ROYAL PICTURES.

THE TROOPERS.

A. Cuyp, Painter. E. Hacker, Engraver.
Size of the Picture, 1 ft. 5½ in. by 1 ft. 2½ in.

ALBERT CUYP, one of the great luminaries of the Dutch school, owes the popularity which now attaches to his pictures to the discrimination and judgment of English collectors. To the want of discernment in his own countrymen, or to their negligence of him and his works, must be attributed the fact that so little of his history has come down to us. He was born at Dort, in 1606, and was instructed in painting by his father, Jacob Cuyp, a landscape artist of considerable eminence, and the founder of the school of painting in that town: there is, however, but little similarity between the works of the master and the pupil.

That able critic, Dr. Waagen, referring to Cuyp's only picture in our National Gallery, thus estimates the general character of his works:—"His pictures, like those of so many of the great Dutch landscape-painters, afford a sufficient proof that the charm of a work of art lies far more in a profound and pure feeling for nature, and in the knowledge and masterly use of the means of representation which Art supplies, than in the subject. For otherwise, how could it be possible, from such monotonous natural scenery as Holland presents, where the extensive green levels are broken only by single trees and ordinary houses, and intersected by canals, to produce such attractive variety as their pictures offer? How could it happen that so many pictures, even by eminent masters, such as Jan Both and Pynaker, who represent the rich and varied scenery of Italy, in which the finest forms of mountains and waterfalls, with beautifully wooded plains, in the most agreeable variety, charm the eye, have less power to touch our feelings than the pictures of Cuyp, Ruysdael, and Hobbema? In grandeur of conception and knowledge of aerial perspective, combined with the utmost glare and warmth of the misty or serene atmosphere, Cuyp stands unrivalled, and takes the same place for Dutch scenery as Claude Lorraine for the Italian; so that he might justly be called the Dutch Claude. In impasto, breadth, freedom, and execution, he has, on the other hand, much resemblance to Rembrandt." And again, when speaking of Cuyp's pictures in the collection of Sir Robert Peel, the same authority remarks:—"How happy must this excellent artist have been in the production of such works! yet they seem to have been but little esteemed about fifty years ago; for nothing is known of his life, and his pictures were so low in value, that this fine landscape (an old castle with towers, &c.) was originally purchased in the town of Hoorn, in Holland, for about one shilling English. But his pictures gradually so increased in value, especially through the approbation which they met with in England, that Sir R. Peel paid about 350 guineas for this specimen." We cannot, however, take this case as an instance of the value set upon Cuyp's works by his countrymen: Sir Robert's picture was doubtless bought from some one who thought that the piece of panel on which it was painted would only sell for the price of the wood: hundreds of fine pictures have thus been rescued from the hands of ignorant possessors, who knew not the treasures they held till they had lost them.

The majority of the pictures by this master are, as it may be presumed from the foregoing observations, in our own country: Dr. Waagen mentions and describes about ninety in different collections. Buckingham Palace contains nine; among these is "The Troopers," of which he says:—"The execution is careful, and the effect of the warm evening light masterly." Smith, in his "Catalogue," enumerates more than two hundred and seventy: of this, which stands No. 244 in his work, he says, it is "a charming example of art:" the group consists of two soldiers, *bourgeois*, one of whom has dismounted from a grey horse, and stands at the head of his steed conversing with a peasant; the other soldier, riding a brown horse, waits for his companion, and a third is riding off behind the ridge of ground. The picture is painted on panel.

THE TROOPERS

FROM THE PICTURE IN THE ROYAL COLLECTION

THE ARTISTS AND AMATEURS' CONVERSAZIONE.

THE first meeting for the season of the "Artists and Amateurs' Conversazione Society" took place at Willis's Rooms, on the 24th of January: the room was well filled with a large assembly of members and their friends, among whom were a very considerable number of ladies; for this society, unlike its elder brother, "The Graphic," does not close its doors against the entrance of those whose presence graces and dignifies every meeting the object of which is to add to the sum of human happiness, or to ameliorate the condition of our fellow-creatures. A member of the Graphic, with whom we conversed in the room at Willis's, observed that "the ladies had no business here; such meetings as these are for artists to talk together about their Art." "And are there no such beings," was our reply, "as lady-artists, and ladies who can converse upon Art, and write about it, too, learnedly, philosophically, and most agreeably? Do you not know that the Art-literature of this country has not a few of its ablest supporters in our female writers? * and even were it not so, upon what principle would you exclude ladies from such an exposition as is now before us? are they unable to appreciate it? too frivolous to be interested in it? unworthy of holding communion with the intelligent minds that created the works so abundantly scattered on these tables, or placed against these walls?" We paused for a reply, but received none, and left the member of the Graphic to pursue his way through the long levies of tables and portfolio-stands extending the length of the apartment; not solitarily however; for he had brought a lady to the meeting, and thus ignored the principle for which he had contended. It would be well for the Graphic, we presume to say, to be less exclusive in the conduct of its *réunions* than it is: it would seem to have the organ of Seeritiveness very largely developed; the doors of the Thatched House are jealously guarded against every intruder, unless introduced by a member, or he is fortunate enough to possess wealth to expend on Art, or to have gained a distinguished name. The fifth law of the Graphic declares;—"That there shall be annually chosen by the Society, and invited to the conversazione, a number not exceeding *twenty noblemen and gentlemen*, who are known as admirers of the Fine Arts, and *encouragers of native talent*; and also that there be chosen and invited *five gentlemen distinguished in science*, and *five others eminent in literature*; such invitations to be made in the name of the Society for the season, from a list to be proposed by the Committee at the end of each season, and presented to the general meeting for election by show of hands." Surely to this miserably restricted list of thirty noblemen and gentlemen, some ten representatives of the public press might be added, to say nothing of the ladies, without detriment to the interests of the Society. We have long since refrained from noticing the proceedings of this Institution—a fact which is, of course, of little importance to the members—simply because we do not choose to be indebted, to enable us to do so, to the mere courtesy of an individual for introduction to the room. And now, having said our say on this matter, we proceed to notice what the "Artists and Amateurs" had got together for the amusement and instruction of themselves and their friends at their first meeting. The oil-pictures were neither numerous nor of a very good order; the best being one or two studies of female figures, and another, a finished work, by Mr. Frith, R.A., and a large painting, by Mr. Britton Willis, of plough-horses resting, entitled the "Morning Meal;" the animals in this work are very carefully drawn, but the landscape seemed to us deficient in vigour, and the distance wants air. Mr. Willis might give another week's labour to his picture with advantage. The contributions of water-

colour drawings, both framed and in portfolios, by Mr. David Cox, Jun., were extensive and good; like his father, he has a capital eye for colour, and a free style of handling; qualities that tell effectively in his sketches from nature. A portfolio of landscape sketches, by Mr. W. Bennett, who belongs to the "Cox" School, attracted a large crowd during the evening; so also did another by Mr. Soper, who is quietly but surely gaining ground among our landscape-painters: we do not remember ever to have seen before this any of his productions in water-colours; they are vigorously painted, and very truthful. A portfolio contributed by Mr. Dillon, of drawings from the pictures in the Pitti Palace, was much admired; they seemed to be executed in pencil only, or pencil over tints of ink, exquisitely finished, and, as we understood, were made by an Italian artist for the purpose of being engraved. Mr. W. Collingwood Smith, the President of the Society, sent a number of his landscape sketches, very boldly executed, and Mr. J. J. Jenkins a good variety of his figure subjects. From Mr. E. Goodall, was a large supply of Crimean sketches, many of which the public has seen in the columns of the *Illustrated News*. But the contributions of two amateur artists appeared to rivet the attention of the company as much, if not more, than any others: one, by Mr. Roberts, a gentleman resident at Camberwell, of landscapes, English and foreign, wrought out with a fine feeling of the truth of nature, a just conception of what constitutes the really picturesque, and a perfect mastery of his materials: the other, by a lady, Mrs. Robertson Blaine, of views in Syria, Venice, &c., and sketches of figures, slight in execution, yet powerful in effect to a degree, and admirable in colour: so excellent are these drawings, they might have passed as the works of some long-experienced master. The meetings of this Society have opened well, with abundance to interest the visitors during the whole evening.

SUGGESTIONS OF SUBJECT

TO THE STUDENT IN ART.*

BY AN OLD TRAVELLER.

CHAPTER III.

The beloved Physician—The House of the High Priest—Who shall paint the Picture?—The Tuscan Masters—Fra Bartolommeo—Il Beato Angelico—The Schools of Umbria—Perugino and his Disciple—Leonardo—Sant' Agnese fuori le mura—Cammeus—"The True Servant of his Master"—Philippe le Hardi—German Writers and the Artists of Germany—A Picture from Umland—The Invitation—An Interior of Elizabeth's Day—"Monsieur his Physnomie"—The King's Visit—An Inediment—Pictures from Cervantes—A Murcian Inn Yard—The Search—An Arrest—The Rhodian Swallow—Children of the Greek Isles—A worthy Race of Dogges—The Heir of Branksome—Masters of Hounds in the Olden Time—Gaston-Phœbus—Barnabè Visconti—The Beagles' Tragedy.

THERE is a passage in the writings of the Syrian Evangelist—"the beloved physician"—St. Luke, for whose profoundly touching uses neither Painting nor Sculpture has yet supplied an adequate exponent. Nay, recalling the wide and various import of those words, it may be affirmed that human art could scarcely avail to give them their full effect, whether in marble or on canvas: but honoured should be the artist, and proud the land of his birth, who should come but near to that heart-moving picture which the mind at least has power to call before it, when we read or listen reverently to the words in question. They are these:—

"And the Lord turned and looked upon Peter, and Peter remembered the words of the Lord." †

The extent to which the hall in "the high priest's house," with the various figures known to have been present, and other accessories, shall be brought into the picture, must depend

on the individual feeling of the artist; the moment which, in the writer's mind, has ever absorbed the whole interest, is that of the utterance of those words—never to be repeated but with the lowliest reverence—"And the Lord turned and looked upon Peter, and Peter remembered." Alas, for the agony of that remembrance! a pang deepened by the divine goodness of the pardon, beaming its gentle assurance from the sacred features of the Master, even while his unhappy follower stood self-condemned, as he lifted his tearful eyes to their light. No; we can never hope to have all this set before us, but the eyes of the mind and heart; nor for these, save in their best and purest moments: I despair of any worthy result, now or ever.

Do you differ from me? You, young, trusting, faithful; who feel that Art is a religion, and that none is worthy to serve at her altars who has not faith in the supremacy of her power. Be it so; and thrice welcome is your conviction, for who shall set limits to what such trust may accomplish?

You believe then that there are artists in the world—no matter to what country they may belong—so richly endowed that even for this high and holy task, this labour of pure love, they may find heart, and head, and hand, that shall prove sufficient? But read again, and you will feel that to assert so much would be to declare that all the noblest qualities demanded by Art in her most exalted phase, may be found combined in the person of one artist—for he who is to succeed must possess them all.

Have you ever seen a head of the Saviour that did not fail to give you entire satisfaction? We might even use less gentle terms, and say, that did not disappoint and chill you? It has at least not often been the writer's good fortune to escape these results, when standing, after long-cherished wishes, and with high-raised expectations, before a work wherein the delineation of the sacred form and features have been attempted, whether in painting or sculpture; yet, in speaking of the latter as well as the former, there is present to my recollection more than one work of great celebrity, and by renowned hands.

From the narrow and ascetic schools of Spain you will not hope much; but there are certain among the Tuscan masters who cannot fail to present themselves to your memory in reference to this subject. Fra Bartolommeo will stand prominent, yet not first, in the group, and there are works of his in Florence and at Lucca,* that might almost justify your thought; but pass through the Pitti Palace, where some of his finest paintings are to be found, and, admirable as most of his pictures are, it does not appear to me that even the "Christ after his Ascension," highly meritorious though it be in very many respects, could wholly satisfy you of his sufficiency for our present purpose.

Of Il Beato Angelico, it may be affirmed that beyond any other master he was worthy to undertake this sacred task; and if pure holiness of purpose, a seraphic devotion, the most lowly reverence, the utmost tenderness, could ensure success, for this—which being eminently a labour of love, and work of the heart, would require all those qualities—in Fra Angelico da Fiesole they were all to be found, and he must have succeeded. Then, you examine his works in Perugia, or you visit the chapel of Pope Nicholas, in the Vatican,† or the Gallery of the Academy in Florence,‡ or you linger long before the frescoes of Orvieto,§ and from each of these places you bring recollections of grace and beauty, holiness and sweetness of expression, which

* Among others, the "Madonna della Misericordia," in the church of San Romano, with another Madonna, having St. Stephen and St. John beside her, in a chapel of San Martino, a church of the same city.

† Where there are ten fresco-paintings, from the lives of SS. Lawrence and Stephen, many of them unhappily much injured by restoration.

‡ Scenes from the life of Christ, formerly in the Santissima Annunziata, the convent of the Servites, in Florence. A "Deposition from the Cross," with figures in pyramidal compartments, attributed to Il Monaco (Don Lorenzo), and many other works by Angelico, are to be found in the Gallery of the Florentine Academy.

§ The subject of these works is "The Last Judgment"; they are in the chapel of the Madonna of San Brizio. In the Corsini Palace, in Rome, there is also a "Last Judgment" by this painter, with whom the subject was a favourite one.

* We need only mention Mrs. Forster, who so admirably edited "Vasari;" Mrs. Jameson, Mrs. Merrifield, the late Lady Calcott, Lady Jervis, "Florentia," Mrs. Bray, the biographer of Stothard.

* Continued from p. 40.

† Gospel of St. Luke, twenty-second chapter, sixty-first verse.

force you to shrine this master in your heart of hearts; inasmuch that when these qualities are in question it is to him that your memory first, nay, almost exclusively recurs: but have you the force and grandeur that you also want? Have you the sublime repose you seek, the dignity and divinity of pardon, the superhuman perfection of all holy attributes that you must equally require? I fear you have not; and wanting these, it is not from Angelico, warmly admired and deeply beloved though he be, that we may hope to obtain the work we look for.

But the prince of painters,—but he of whom it has been truly said, that in him “beauty of form is the expression of elevation of mind, of utmost purity of soul” *—even Raphael; surely, you will perhaps say, “from his hand we might have hoped whatever the most devoted disciple of our Lord could either imagine or desire.”

To this I will but reply, that if, for the greater glory of Art and the happiness of his contemporaries, Raphael had been permitted to delight and benefit his kind some ten years longer, he might, without doubt, have achieved whatever human power could or can accomplish towards the object we meditate.

You do not name Il Perugino—you omit all mention of him whose light, deservedly brilliant, was yet much dimmed, if not eclipsed by that of his greater disciple, as we find remarked by more than one writer. But if you examine his works, at a period when he was as yet untouched by those injurious influences which did undoubtedly ruin the efficiency of this painter, you will admit that he has not always received full justice; and if not meet for the work we think of, he is at least well entitled to take rank among the first of the Umbrian masters. We have not space for the citation of particular instances among his numerous—too numerous—works, in proof of this assertion, but without going beyond the walls of the Florentine Academy, you will find enough to convince you that the obligations of Raphael to his early master have been frequently underrated.

Loud and long have been the plaudits that have ever followed the name of Leonardo da Vinci, yet has he never had all the praise due to his deserts—has not and cannot have; for if the life of the most enduring patriarch had been doubled in his instance, he could have filled it all with glory. What then was there wanting to Leonardo? He wanted leisure; and that notwithstanding his length of days. Courts and Kings came between him and his genius; and here I do not allude to the universality of his powers and attainments, a quality in which he was never approached, I am content to abide by what he was, as relates to the formative Arts only, and I say that, when left to his own inspirations none could surpass him. To name but one proof, out of many that may be given—for our space has long been overleaped—go to Milan, and in the Gallery of the Brera you shall find a work which, although but a sketch, may serve appropriately to illustrate our present position, since it is a head of Christ, believed to be a study for that now ruined treasure, Leonardo's “Last Supper.” Beautiful things by the same master are also to be found in the collection attached to the Ambrosian Library, in the above-named city; but for the moment they must all be left unspecified.

There is a small bust in marble, standing on a lonely altar in the subterranean church of Sant' Agnese, beyond the walls of Rome, and popularly attributed, but without sufficient authority, to Michael Angelo. It does not remind you of the great Florentine, and there is much to desire in the work, but the expression has a beauty of holiness too often sought in vain.

“I am ending the course of my life; the world knows, and will one day bear witness to the truth, that I have dearly loved my country; I have returned, not only to die in her bosom, but to die with her.”

Such are the words of Camoens, uttered at the close of his varied life. It is still of Portugal

he thinks, not of himself: heart-broken for the ruin he saw clearly to be impending over his native land, the patriot-poet forgot, if he did not disdain to mourn over, his own sorrowful condition. Let us see how his country repaid him.

Through one of the most frequented streets of Lisbon a busy population is pouring its noon-tide stream: priest and soldier, peer and peasant; the high-born dame and the dark-eyed maiden of lowly birth, her loveliness and sweet goodness her sole dower; the crutch-borne gaudsire, bent with age, and the dancing child caring for none of these things; you have here whatever a great city has to offer; but the interest of the whole is concentrated—for you—on the head of an aged beggar, whose whitened beard descends from a face of beautiful expressions, although he may not boast the features of the proud Caucasian races.

For this is the Javanese servant of Luis de Camões: of Camoens, “at once the Homer, and the Virgil of Portugal.” He is begging for the morsel that is to sustain the life of his master during the few short days yet to intervene, before the most illustrious bard of Lusitania shall die miserably on the flock bed of the public hospital. Too scanty, alas, is the pittance accorded; and the brave soldier, the enlightened patriot, the inspired poet—for Camoens was all these—sinks untimely, despite the faithful cares of his follower. Do not let the devotion of that true servant to his master be forgotten. Time—the all-restoring, no less than the all-destroying—has offered to the Poet such reparation as Faune may give—the follower yet awaits his guerdon; let the hand of the artist weave the chaplet for his brow, and be certain that it shall not be placed on an unworthy head.

Two causes are assigned for the epithet “Le Hardi,” bestowed on Philippe, son of John of France, the incidents are not in either case ill-suited to the purposes of the painter, and you shall have them both.

At the Battle of Poitiers, the Dauphin and his two brothers, the Dukes of Anjou and Berri, were prevailed on to leave the field, even while the conflict was still raging; thus they may be said to have abandoned their father, who was hotly engaged in the midst of the strife; but Philippe, the youngest brother, then but sixteen years old, refused to accompany them, and kept close to his father's side: severely wounded, he yet fought on, and was taken prisoner with the King—a result which at that period, and with his feelings, the young prince must have detested more than wounds or death.

For his brave defence of his father on this occasion it was that, according to some writers, he received the name of Philippe le Hardi; others declare the following incident to have given rise to the appellation.

While at the English Court, Philippe was in the habit of attending, with other young nobles, —and as was the custom of the time—on the two kings as they sat together at table, when he remarked that one of his companions, an Englishman, and subject of Edward, presented the viands to his own Sovereign before offering them to the King of France. “Thereupon,” as an old writer on the subject hath it, “this prince up with his fist and dealt that youth a wherret on the ear, saying—‘How uow! hast thou dared to serve the King of England while the Monarch of France sits at the board?’”

The affronted noble drew his dagger, and raised his hand to avenge the blow, but King Edward, hastily extending an arm, drew the French prince within his clasp, and commanded the justly-enraged assailant to forbear. Then, turning to John, who was an anxious spectator of the scene, he exclaimed, with a friendly smile; “We must call this boy Philippe le Hardi; we may be sure that he will know how to justify the title.”

Now, the battle or the buffet? one or both. There is no lack of interest in either picture, nor any danger, methinks, that you should suffer the salient points of either action to escape you.

The artists of Germany do not let the words of its writers fall unheeded to the ground; least of all could Göthe complain of inattention on their part to such oracles as it pleased him to propound.

Here is half a line, written from Velletri, in a letter, dated 22nd February, 1787, in which the author simply uttereth the following. He is speaking of Prince Cligi's seat at Aricia, and he says:—

“Es gäbe das grösste Bild, wenn es ein rechter Künstler unternähme.” “This would furnish the finest of pictures, if a true artist would undertake it.”

On this hint it is that Oswald Offenbach, an exhibitor in the German Exhibition held in London last year, has spoken; his landscape—seen by the present writer at Vienna in 1852, but mentioned principally in illustration of the remark made above—is an Italian scene of well-known features, and will rise before you without further description. We will presently show that our own oracles yield responses by no means less significant than those of the great German; nor will we be negligent in the consultation thereof, when the propitious moment shall arrive; but for the present occasion, we too will seek our picture among those painted by the pens of our Teutonic cousins.

And in Uhland we find one, still a landscape, but appealing to a wider range of sympathies than that so faintly intimated above; if not for itself, yet certainly for its figures, and for the universal interest of that feeling which animates the speaker, and is as clearly shared by the listener, of the group. It is in “Die Einladung” —“the Invitation,” that we find it, the words are these:—

“Ich hab' ein kleines Hütchen nur,
Es steht auf einem Wiesenflur,
Bei einem Bach, der Bach ist klein,
Könnst aber wohl nicht heller sehn.”

The following may be accepted as a translation sufficiently close to give the features of the scene, with the relation borne by the actors to each other; a cordial and pleasant one, as ye shall see in a summer day's journey:—

“Mine, dear one, is a poor cot only,
'Tis in a vale, flower-gemm'd and lonely.
There's a glad streamlet dancing near,
A rude wild thing, but crystal clear.”

Then follow two stanzas concerning a tree and a nightingale; but these, if you be so minded, we can “prætermitt.” The conclusion is as follows:—

“Du kleine, mit dem Blonden Haar,
Die längst schon, meine Frende war.
Ich gehe; rauhe Winde wehn.
Willst du mit mir ins Hütchen gehn?”

“Sweetest! with locks of golden sheen,
Thou who hast long my sole joy been.
Lo! I depart. The chill winds blow.
Wilt with me to my poor cot go?”

And she will go. The earnest-looking supplicant is not doomed to refusal. He may say with the Muscovite lover—

“'Tis not to day that first we tell
How long our hearts have loved—how well.” *

And the maiden? She is no mere “yellow-haired lassie”—the sweet girl! the “golden sheen” is on locks of a soft clear lovely brown; but they have it, and to perfection, that sheen. Do not believe the lover's partial eyes are seeing what exists only for them; look for yourself:—that is a veritable golden glow on those rich brown tresses; but, much better than this, she lifts trustingly towards the face of the speaker a pair of the most heart-warming eyes—deep dark blue, with a tinge of the violet, and a tempering fringe for their lashes: these give comfortable assurance that the hope of her frank-looking manly suitor will not be rendered vain, now or hereafter. What a firm, yet elastic, step, too, is that with which she draws yet nearer to her lover's side: the figure is worthy of the face, which gives a thousand pleasant promises in its somewhat serious, yet sweet and cheerful aspect. Nor is the winner of this prize unworthy of his

* See Kugler's “Handbook of Painting,” with the valuable notes of Sir Charles Eastlake, Part II., p. 326.

* Bobrov, from the “Russian Anthology” of Sir John Bowring.

fortune: you see well that he is the proper counterpart of that fair girl: wherefore, let us give them our benison, and leave them to their happiness.

Meanwhile we may bestow a glance on the place of their abode: and you see that in addition to the "Vale"—charmingly framed in by fine heights, where the stream does not close its bounds—there is a delicious "distance,"—and across a glade of this, you may perceive a doe with her fawn, passing slowly. It is then veritably a "lonely" dwelling, that you can but just discern, partially appearing beneath the grand old oaks;—so much the better: and blessed be their lot therein, the winsome pair.

Highly worthy of the painter's attention, and not unfrequently chosen by our artists for the varied effects they present, are the rich and quaint Interiors of Elizabeth's time; and here is one of the Palace of Theobalds, which combines almost every attribute, whether of form or decoration, whereby these gorgeous rooms attract to themselves so large a share of the artist's regard.

A chamber of ample space it is, and exhibits due harmony of proportion: the prevailing tints are deep and warm; and, for the moment, the place is tenanted by a fluttering bevy of fair damsels, eagerly clustering about a table whereon are placed rare caskets of Italian workmanship. One of these stands open and displays the jewels, brought, without doubt, by the dark-looking figure, in southern garb, who is evidently "waiting her Highness' pleasure."

Elizabeth herself, no longer young, is seen walking slowly along the terrace, which is visible from the open windows of the room. She has been interrupted in her examination of the "gauds" by some less agreeable occupation; her head is bent thoughtfully; and she seems to be listening, in some displeasure, to the ancient noble, whose step follows her own at the distance of less than half a pace: he is, in fact, all but walking beside her.

This group offers a notable contrast to that gathered around the stranger,—a Venetian merchant, perchance, admitted to this high presence in consideration of the rarity and great value of the productions enriching his caskets. Towards one of these, still closed, a fair and curious finger is pointed, as if the owner would entreat that its contents might be given to her view; but the matronly dame, who is extending her protecting hand over the lid, while she turns a warning glance on the stately figure without, seems to recommend discretion, until their royal mistress shall return to set the treasure free.

In the right hand of the merchant is a jewel which fixes general attention, and if not that very "littell floure of gold, with a frogge thereon and therein Mounsier his phisnomye,"—the said "phisnomye" believed to be a portrait of the Duke D'Alençon, afterwards Duke of Anjou, and one of Elizabeth's most nearly successful suitors—it is yet manifestly worthy of all consideration, in the eyes of the group by which its fortunate exhibitor is surrounded. The left hand of this personage holds a "pomander-box" not unlike to that "cunning flasket of amber, with a foote of golde and on the top thereof a beare, with his ragged staffe"—the device, as our readers will remember, of the Earl of Leicester—which was also among the possessions of Elizabeth in that day when her "three thousand gownes" had all to be resigned for the narrow garments of the tomb.

Fallen from the open casket and lying on the table is "A cawle of gold, with nine true-loves of pearl and seven buttons of fine gold, with, in each button, a ruby," and beside this desirable decoration lie certain "nutte-crackers" also of gold, having "diamond sparkes to garnish the heade and pointes thereof." Other and equally dlectable contrivances there are, "happy woman be her dole," who is privileged to behold, what then to call herself mistress of such!

But some topic scarcely less absorbing, is surely in discussion by that youth, half-concealed in the shadows of a distant window, or he could scarcely have induced the bright girl who

listens, to abandon the dear occupation of her companions. She glances towards the terrace, where paces the grim Majesty of England, but Elizabeth is happily intent on other cares, and so the colloquy holding in that deep recess may proceed to its obvious results. Numerous accessories heighten the interest of the picture, as Imagination presents it brightly to the view, but these will vary to infinitude, as the taste and character of him who paints shall vary: wherefore we need not further indicate such as "our own poor fancy" furnishes.

Continuing to stay at home at ease—let us nevertheless vary our ground to some extent, and see whether the romantic annals of the mother-land may not furnish us with a subject that shall enable some aspirant to a name in the future to show us how fire should be exhibited on canvas. There is a well-authenticated fact, closely germane to the matter, among the not always praiseworthy *Gestes* of Henry VIII., and as it does not appear in the general history of the period—although conspicuous in its local records, the story is believed to have escaped the notice of our painters.

Among the rich possessions of that lovely Joan Plantagenet, whose poetical appellation the "Fair Maid of Kent," will perhaps be best known to our artist-readers, was the manor-house of her maternal ancestor, Baldwyn de Wake, which, having been strongly fortified by Thomas de Wake in the early part of the fourteenth century, was thenceforth known as Baynard Castle.

It was perhaps about the third decade of the sixteenth century, and when the dangerous vices of our eighth Henry's later life had rendered his nobles cautious of their monarch's approach to the sanctuary of their homes, that the then Lord of Baynard Castle—still a De Wake—had taken to himself a beautiful bride, with whom he there lived in close retirement. Rumours of the lady's loveliness had not failed to reach the court, and Henry, visiting his northern cities, resolved to judge for himself as to the justice of the praise bestowed on it,—thus he despatched a messenger to his great feudatory, giving the latter to know that on the day following the one which saw the missive reach him, he might expect the honour of a visit from his sovereign.

But De Wake knew the character of the perilous guest proposed to him; therefore it was that he avoided the court, and he was firmly resolved that no breath of suspicion, such as might well be apprehended from the menaced visit, should pass over the fair fame of his wife.—Yet how decline the proffered distinction? He could invent no pretext, discover no means for doing so—the moments were passing rapidly, an early hour of the following morning had been named for the King's arrival, yet night fell and eleven o'clock—an unusually late period for vigil at that time—found De Wake with the King's letter still in his hand, while he remained wholly undetermined as to the mode whereby he might escape from the danger, which he had nevertheless resolved not to incur.

His fair wife,—to whom he had confessed his apprehension of the King's arrival, but without offending her ear with any intimation of its cause—had long stood beside him, now suggesting some plan—rejected as soon as proposed, then again devising some other method, which had no better fate, and anon doing her best to reconcile her husband to an infliction that seemed inevitable.

"His presence will not disturb us long,"—she urged, when, all her simple wiles declared to be impracticable—she became convinced that the visit must be endured, since better might not be.—"He will not be with thee more than the second day at most, my husband," she softly said, "then we may return to the quietude thou lovest so well, and will forget that ever he came."

But this did not avail to diminish the gloom that had settled on the brow of De Wake, and hopeless of an issue from the dilemma into which they had fallen, the young bride laid her head mournfully on the shoulder of her husband, and burying her small hand lovingly amidst the

waving locks on his forehead, she exclaimed, "Now I would that we were but as our good Robert the Forester, and had no kind of dwelling that could lodge this evil king."

Her words were an inspiration! "Thou hast said it, sweetheart," returned her awakened lord, and rising hastily from his attitude of despondency he aroused his seneschal, an old and trusted servant of his house, commanding him at once to summon that Robert the Forester, to whose lowly abode the lady had so opportunely referred. For a moment she remained in blank astonishment, unable to divine the manner wherein her lamentation over their inconvenient greatness could avail to deliver them from their strait, but the directions given to his seneschal by her husband, soon made her sensible to all the value of her words, and after a few hours spent in the needful preparation, she was led forth by De Wake to a bold elevation at a safe distance from the home whose splendour she had bewailed, and which they presently beheld blazing at all points.

Morning found the high-born pair without any dwelling wherein they could lodge yon "evil king;" they were reduced to accept shelter from Robert the Forester, and as his hut could not suffice beyond the first moments of necessity, De Wake was constrained to bear his wife to a distant abode, having duly notified to the approaching sovereign that untoward mishap whereby the honour of a royal visit had been for that time lost to his house.*

There is more than one point of time in this narrative, sure to recommend itself to the pencil of the painter. Even to the duller and less imaginative eyes of the writer many pictures arise, as he reproduces the old story, and to the choice of the artist we leave them. Three daughters inherited the beauties and excellencies of this fairest lady—whose maturer life proved her to be wise and good as well as lovely—but she had no son, and each of the three carried a portion of her broad lands into a noble family whose name still remains to such portions in attestation of the fact. The Duke of Richmond, the Earl of Westmoreland, and the Lord of Powis, were the bridegrooms of those maidens respectively, and the lands received by these nobles with their brides, continue to be called Cottingham Powis, Cottingham Westmoreland, and Cottingham Richmond, accordingly.

Among the shorter stories of Cervantes, less known than his *Don Quixote* and not so much admired, but works of considerable merit nevertheless, is a tale of a gypsy-girl, which having been translated into English, is in the hands of most readers. Within its few pages are many pictures, and here is one that has at least the advantage of animation.

The scene is in the *patio* or court-yard of the Murcian venta, or inn, where Juana, the daughter of the ventera, or landlady, having fallen in love with the nobly-born *Novio*, or betrothed, of the heroine *Preciosa* (who lives disguised among the gypsies, to be near his promised wife)—is avenging herself for his refusal to accept her own hand, by accusing him of theft, and demands to have the baggage animals of the gypsy-tribe, all loaded for departure and surrounded by their owners equally prepared for travel, unpacked and examined in search of her lost property.

Now Juana had concealed certain of her jewels among the packages of Don Juan, the disguised lover, but, unsuspecting of her treachery, he rebuts the charge with unembarrassed mien. The delicate face of *Preciosa*, calm in her assurance of her lover's integrity, presents a striking contrast to that of the bold Juana, and even to those of her companions, who are of gypsy-race, while she, as the story has already told us, is, like her lover, highly-born. The old woman who has stolen her, and who stands near, is in consultation with men of the

* The reader will be hereby reminded of a similar sacrifice made at a later period by the then chief of the noble house of Campden, but under circumstances of different character. Lord Campden destroyed his Gloucestershire manor-house, to prevent the troops of the Parliament from availing themselves of its shelter.

tribe, varying in age, but all presenting the picturesque forms and handsome features of their race.

The officers of justice, summoned by Juana, are entering the court, and the *mozo de la cuadra** is contending with a gypsy-woman from whose ass he is removing its burthen.

At a later moment in the same incident, there is a second picture of a totally different character, although with the same actors. Don Juan, having received a blow from a soldier, and forgetting all but the dictates of a suddenly awakened rage, has torn the sword of the offender from its scabbard and laid him dead on the spot with his own weapon. "Then do cries for vengeance become frantic yells," exclaims the Spanish author; "then do the kinsmen of the dead fall on the disguised cavalier: Preciosa sinks down fainting, Don Juan, hastening to assist his betrothed, neglects to provide for his own defence and is seized before he can approach her, while the old hag of a pretended grandmother wrings her brown hands, and the wicked Juana—cause of all the mischief—smiles with the joy of a demon over the ruin she has made."

In all this there is evidently much life and movement; the first of these pictures is perhaps the most attractive, but the second may be preferred by some of our young readers, to whom we leave the choice without further comment.

A custom recorded by that most voracious of readers, and strangely various writer, Athenæus, of Naueratis,† as prevailing in his time, and which probably continues to prevail even to our own day, in the more unfrequented of the Greek isles, must needs present many circumstances well calculated to afford matter for the study of the painter.

When the Swallow returns with the return of spring, bright troops of Rhodian children, securing tenderly the first they can obtain, hear the bird with jubilant songs and dances from dwelling to dwelling. They are crowned with flowers, and rejoicing beneath the blue sunny heavens of their delicious clime, they sing the following strain:—

"He comes, the bird whose wing shall bear
To us soft hours and seasons fair,
The Swallow hither comes to rest
His sable wings and snowy breast.

Then from thy flowing wealth bestow
Rich flagons of the rosy wine,
And wheaten cakes of flour most fine.
The ripe fig-cheese with in our baskets stow,
And let the Swallow-guest partake
The dainties of thine omelet cake.

Now shall we empty-handed go,
Or will you give? Say, 'Yes' or 'No.'
If 'No,' then see you guard your door,
We'll take it, posts and all,—nay, more,
Your dainty wife—'tis mere child's play,
So light she is—we'll bear away.

Give, then, and give with liberal hand,
The Swallow asks, your doors unfold,
No grey-beards we, faint, feeble, old,
But Rhodian boys that on thy threshold stand."

The pictures presented by these verses require no further description, they "*sautent aux yeux*," as our neighbours say, and very pleasant encountering too.

The love of Sir Walter Scott for every "worthie race of dogges," as quaint Gervase Markham hath it, is well-known; and from his honoured hand we have here, what is called by a competent judge, "the best poetical description yet written of one species in action." That

species is perhaps not the most amiable or most interesting of its kind, but it is at least among the most sagacious. In any case the words of Sir Walter present you with an excellent picture. They describe the heir of Branksome when lost in the forest, and do their "spiriting" so effectually that not another word needs to be added.

"He journey'd on,
And deeper in the wood is gone,
For aye the more he sought his way,
The farther still he went astray,
Until he heard the mountains round
Ring to the baying of a hound.
And bark, and bark, the deep-mouth'd bark,
Comes nigher still and nigher,
Bursts on the path a dark blood-hound,
His tawny muzzle track'd the ground,
And his red eye shot fire.
Soon as the wilder'd child saw he,
He flew at him right furiously.

I woe you would have seen with joy,
The bearing of that gallant boy,
When, worthy of his noble sire,
His wet cheek glow'd 'twixt fear and ire;
He faced the blood-hound manfully,
And held his little but on high;
So fierce he struck, the dog, afraid,
At cautious distance hoarsely bay'd,
But still in act to spring;
When dash'd an archer through the glade,
And when he saw the hound was stay'd,
He drew his tough bow-string,
But a rough voice cried, 'Shoot not, hoy!
Ho! shoot not, Edward! 'tis a boy!'

Here follows a prose description of this dog (the blood-hound) by an excellent authority of the day:—

"A true blood-hound—and the pure breed is rare—stands about eight-and-twenty inches in height; he is muscular, compact, and strong; the forehead is broad and the face narrow towards the muzzle; the nostrils are wide and well-developed; the ears are large, pendulous, and broad at the base; the aspect is serene and sagacious; the tail is long, with an upward curve when in pursuit, at which time the hound opens with a voice deep and sonorous, that may be heard down the wind for a very long distance.

"The colour of the pure breed is almost invariably a reddish brown, darkening gradually towards the upper part till it becomes mixed with black on the back; the lower parts, limbs, and tail being of a lighter shade, and the muzzle tawny." Pennant adds—"This dog has a black spot over each eye;" but those in the possession of Mr. Astle, known to be of pure blood, have not these marks.

Speaking of hounds in general, Gervase Markham says—"They runne surely, and with great holdness, *loving the Stagge* more than any other beast, but they make no account of hares."

Now herein these estimable animals differ widely from those fairy beagles about whom so disastrous a tale is told, for these did so *love* the hare, according to Markham's definition of loving—namely, worrying to the death—that they were never known to return from the chase without having "stuck to and worried her at the last," even though they "could never get near enough to press her very closely in the early part of the run."

What marvel then, since such was their beautiful persistence, that their happy and yet most unhappy owner should die of despair when—But we are beginning our tragedy at its close, and must recommence, to proceed "in the forms."

These exquisite little Beagles, (so delicately diminutive that the whole symmetrical twenty-two of them were taken to the field in a pair of paniers on a horse's back,) were one night locked safely in their kennel, with all the care due to their perfections; but lo you, now! what chances? on the following morning was it not found that some thief, or rather, some body of conspirators, had forced the door, and that the whole "ery of beagles" had been carried bodily thence? Alas! they had! and since this is hut too true, can it surprise us that the disconsolate owner should break his heart? or if he did not actually effect so much, one is almost inclined to say he ought to have done so, and the rather as a more appropriate manner for the dying—I beg his pardon, the "going to earth" of a master of hounds, "well-bred," could scarcely be imagined.

Talking of masters of hounds would remind one, if his history were not in other respects so

melancholy as almost to darken one's recollections even of Dame Juliana's joyous science,—of that brave, wicked, handsome, horrible Gaston-Phœbus, Count de Foix, whom one knows not whether most to admire and pity, or most to shudder at and abhor, hut whose kennels (to keep to our muttons) held no less than 1600 dogs, "worthie" or not, as the case may be, and who made the wilds of his beautiful territories amidst the glorious Pyrenees daily echo with their music.

Hear this, ye Lambtons, Wardes, Beaumonts, and Asheton Smiths, past, present, or to come: ye of our own merry hunting-grounds; hear it and hide your diminished heads, whenever numbers rather than quality may chance to be the question!

Yet is even this great "M. H." fairly eclipsed by one of the Visconti, whose dogs amounted to full 5000, and who loved them so much better than his peasants—whose lives were chained to the care of the animals, these last being drafted into different villages, since Visconti had not kennels for their lodgment—that if he found one too lean, he would cut off the keeper's ears, and if another proved too fat, the delinquent's members were equally forced to pay for the mistake: the dismal remembrance whereof shall make this suffice for the subject, which is else one that we might be willing still to dilate on together; for I hold that he will prove but a cold kind of artist who doth not love "a worthie race of Dogges."*

OBITUARY.

MR. WILLIAM RADCLYFFE.

Mr. Radclyffe, an engraver of considerable practice and distinction, long settled at Birmingham, died there, on the 29th of December last, in his seventy-third year. We have, on more than one occasion, availed ourselves of the talents of Mr. Radclyffe, on the engravings which have appeared in the *Art-Journal*. He executed for us "*Rest in the Desert*," after the picture by W. Muller, in the volume for 1847; and "*Crossing the Sands*," after Collins, R.A., in the volume for 1848. We abridge from a local paper, the *Midland Counties Herald*, the following account of his career.

"Mr. Radclyffe was a native of this town, and resided in it for more than seventy years. Devoting himself to Art as his profession, he zealously applied himself to line engraving, giving at an early period of his career unmistakable proofs of proficiency by an ably-executed plate of the late Rev. Dr. Milner, after a portrait painted by the late Mr. H. Barber. Another portrait of Lord Nelson, published about the year 1805, was also conducive to his reputation. Afterwards he contributed largely to the gratification of the popular taste for light literature, pictorial illustration, and sumptuous binding, by furnishing a number of the plates by which the annuals, in their best days, gained their popularity. He engraved various pictures by Turner, Reinagle, and other painters, but the '*Graphic Illustrations of Warwickshire*,' issued in 1829, was undoubtedly his *chef-d'œuvre*. This charming volume, which still maintains the reputation of being a standard book, was enriched by thirty-two line engravings, from drawings by David Cox, De Wint, J. D. Harding, J. V. Barber, Westall, Hutchinson, and others. The engravings were all executed by Mr. Radclyffe himself, and have probably never been surpassed, or even equalled, as book plates. Roscoe's '*Wanderings in North and South Wales*' owes much of its attractions to the productions of Mr. Radclyffe's hand. In 1814 he was associated with Mr. Barber and Mr. Samuel Lines, in establishing the first School of Art opened in Birmingham. The institution was dissolved in 1821, and in the same year the Society of Arts, in New Street, was founded. With this institution Mr. Radclyffe was associated from the commencement. When the disruption between the artists and the society took place, in 1842, Mr. Radclyffe followed the fortunes of his professional brethren, assisted in forming the present Society of Artists, and continued to discharge the duties of an active member until he was seized with the affliction which terminated in death. Many engravers of established fame were trained in their Art by Mr. Radclyffe, amongst them being Mr. J. T. Willmore, A.R.A.

* To be continued.

* Mozo de la Cuadra, hostler or stable-boy.

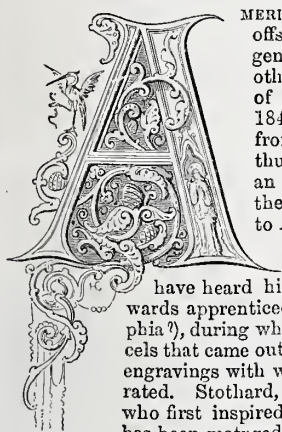

† He is said, by a German writer, to quote more than fifteen hundred lost works, and to cite the names of seven hundred authors, many of whom would have remained unknown but for Athenæus.

‡ This translation is by the Rev. J. Mitford, and will be found in the pleasant "*Favourite Haunts*" of Jesse, p. 295. It is supposed by the present writer—who is acquainted with the original by extract and translation only—to be taken, as are other passages in the same volume, from the "*Διαιρησις*" of Athenæus; that being the only work of the author—a few fragments excepted—that has been preserved to our times.

BRITISH ARTISTS: THEIR STYLE AND CHARACTER.

WITH ENGRAVED ILLUSTRATIONS.

No. XIII.—CHARLES ROBERT LESLIE, R.A.

AMERICA claims Mr. Leslie as one of her own offspring, and here, in Art-circles, it was very generally believed that he was born on the other side of the Atlantic, till the appearance of a letter in the *Art-Journal* of January, 1843, set the matter at rest. This letter was from a fellow-student with Mr. Leslie; it ran thus:—"Leslie has no more title to be called an American than you or I: he was born in the parish of Clerkenwell, and was taken early to America by his parents, not so early, however, as to prevent his having a perfect recollection of the voyage out, of which I have heard him relate many particulars. He was afterwards apprenticed to a bookseller in New York (Philadelphia?), during which time it was his delight to open the parcels that came out from England for the sake of the beautiful engravings with which the books were at that time decorated. Stothard, Smirke, Cook, and Uwins were the artists who first inspired Leslie with that love of painting which has been matured by study into excellence. No sooner had he emancipated himself from his short apprenticeship, than he returned, yet a youth, to his native country, and entered as a student at the Royal Academy, where he soon distinguished himself," &c. &c. These facts are

in all essential particulars borne out in a biographical work* very recently published; we there read that Mr. Leslie, "painter and author, was born in London,—not, as often stated, in America, but—of American parents, in the year 1794. In 1799 his father quitted England, and settled in Philadelphia, where the painter was educated. In 1811, the latter returned to England to study the Art. His first instructors in England were both American-born artists; the venerable President, West—who in all ways showed himself a kind friend to the youth—and Washington Allston, a painter of very refined taste, better and more justly known on the other side of the Atlantic than on this." We believe there is an error in this statement; that Mr. Leslie's parents were not American but English; they migrated to the United States, where the talents of the youth attracted the notice of some gentlemen, who advised his return to this country, and gave him letters of introduction to Messrs. Dunlop & Co., American merchants in London, afterwards his warm friends and earliest patrons.

According to the statement of an American writer,† Mr. Leslie's "first attempt was a likeness of Cooke the tragedian, taken at the theatre while apprenticed to a bookseller at Philadelphia. He soon copied admirably, and became, like most of his fraternity, early occupied with portraits. After teaching drawing a short time at West Point, he resigned the appointment, returned to England, &c. She claims him as her own, but although born there, his parents were Americans, and his first lessons in art received on this side of the water." We have before us another sketch of all the eminent living men of our day, whatever the subject may be which has raised them to distinction.

* "Men of the Time." Published by D. Bogue, London. A most valuable book of reference: it gives a short, yet, for general purposes, sufficiently ample historical sketch of all the eminent living men of our day, whatever the subject may be which has raised them to distinction.
† "Artist Life; or, Sketches of American Painters." By H. T. Tuckerman. Published by D. Appleton & Co., New York. 1847.

received his education at the Charter-House School, along with his brother. It was at this school that he first became instructed in the rudiments and elementary parts of drawing, under the tuition of Burgess, the father of the present talented artist of that name; excellent for his delineation and portraiture of trees. And long previous to his quitting the Charter-House School, the pupil had by many degrees outstripped the master in the character and general beauty of his drawings." We give both these statements without attaching credibility to either of them; for it is scarcely probable that Leslie, himself yet untaught, and employed in a business, would either have the ability or the time to become an instructor, and moreover he was not more than sixteen years of age when he returned to England. Mr. Tuckerman is evidently wrong in his dates; the appointment of Mr. Leslie to the military school at West Point did not take place till several years after he had become a Royal Academician. Neither does it seem likely that he was ever in the Charter-House School, for he could not have been above six years old when his father took him to America, and after he came back he must at once have entered the Royal Academy. After all, it is of comparatively small moment where a man of genius is born, or where educated: still, every country has a right to be proud of her great minds, and England, as we presume to have shown satisfactorily, may claim Mr. Leslie on the score of birth, parentage, and Art-education, while to America belongs the honour—and it is by no means a slight one—of discovering his talent, and putting him in the right road for its full development.

The earliest works of this painter were, as is often the case with tyros, of a rather miscellaneous range of subject. Young artists are apt to test their own powers, as well as the taste of the public, in a variety of ways, that they may ascertain what is likely to succeed, and what it would be policy to avoid. Mr. Leslie attempted history, sacred and profane, and domestic subjects. In the collection of Sir John Leicester, afterwards Lord De Tabley, was a large early painting by Leslie, of "Saul and the Witch of Endor," which showed the young artist to possess very considerable skill in composition, and much poetic imagination;

it bore evidence also of great power as a colourist. He soon however had the perception to discover where his strength lay, and at once directed his attention to painting English history from the pages of Shakespeare, and scenes admitting similar dramatic treatment, from Sterne, "Don Quixote," the "Spectator," &c. Among his most successful early pictures, were "SIR ROGER DE COVERLEY GOING TO CHURCH AMID HIS TENANTRY," a work, as Dr. Waagen remarks, of delicate observation of character; in it we recognise "the fine old English gentlemen" whom Steele describes, kind, courtly, and benevolent: it is in the possession of the Marquis of Lansdowne. Others were "ANNE PAGE AND SLENDER," and "MAY-DAY IN THE REIGN OF QUEEN ELIZABETH," all three of which were engraved not very long after their appearance, and are now transferred to our own pages. In 1821 Mr. Leslie was elected associate of the Royal Academy.

In 1824 appeared his first version of "SANCHO PANZA AND THE DUCHESS," painted for the late Lord Egremont; other versions, such as that in the Vernon Gallery, were produced some years afterwards: our readers who will take the trouble to compare the engraving on this page, which is from the former work, with that we gave three or four years since in our "Vernon Series," will see what variations the artist has introduced into his later work. Miss Rogers, sister of the deceased poet, has, according to Dr. Waagen, the

repetition of this subject. In 1825 he exhibited "Slender, with the assistance of Shallow, courting Anne Page;" "Sir Henry Wotton presenting the Countess Sabrina with a valuable jewel on the eve of his departure from Venice," engraved in "Wotton's Lives;" and six subjects (drawings) from the Waverley Novels, engraved in the illustrated edition of Scott's works. In this year Mr. Leslie was chosen Royal Academician, and signalled his election in the exhibition of the following year by his "Don Quixote having retired to Sierra Morena to do penance, is induced to relinquish his design by a stratagem of the Curate and the Barber, assisted by Dorothea." This work elicited very general admiration, yet perhaps even less than his picture of 1827—

for we do not rank his two clever studies of the heads of Sancho Panza and Don Quixote, exhibited the same year, as anything else but studies—"LADY JANE GREY PREVAILED ON TO ACCEPT THE CROWN," this picture, from the gracefulness of the composition, the truthful and poetical feeling thrown into it, and the purity and sweetness of the colouring, must take its place among the finest works of the artist; it has been engraved on a rather large scale. The following year Mr. Leslie exhibited nothing, but in 1829 appeared another capital scene from the "Spectator," "Sir Roger de Coverley having his fortune told by Gypsies;" it tells the story in a forcible and natural manner. The year 1830 was also a blank. To the exhibition of 1831 he contributed "Uncle Toby and the Widow Wadman," now in the Vernon Gallery. Mr. Sheepshanks has a repetition of this inimitable picture, in which the widow appears somewhat more refined in character than in the Vernon picture; the other contribution of this year was a scene from the "Merry Wives of Windsor," the dinner in Mr. Page's house; the personages of the dramatist are placed on the canvass with singular appreciation of their characters, and are painted with great solidity and firmness of drawing, and with a powerful general effect arising from the skilful management of the two principal colours, black and red. This picture, we believe, is also in the possession of Mr.

Sheepshanks. In 1832 he exhibited two pictures, one of them of a nature to tax the powers of any artist; this was a "Family Picture," containing portraits of about a dozen members, male and female, of the Grosvenor family. Leslie, says a critic of the day, "mastered the difficulties of the subject, and proved how subservient every obstacle can be to one who knows how to study nature in her proper mood, and conceive a proper taste in the selection and arrangement of his objects." It was painted for the Marquess of Westminster, in whose possession it of course remains. The other, a scene in the "Taming of the Shrew," where Petruchio, Catherine, Grumio, and the Tailor are present, and Petruchio vents his rage upon the trembling maker of the lady's cap and gown, represents the incident of the play in a perfectly truthful yet original manner; the attitude and expression of each figure are really dramatic, yet not overstrained; this quality of close adherence to nature is one of the great charms of Mr. Leslie's illustrations to Shakspeare, Don Quixote, &c. Mr. Sheepshanks is also the fortunate owner of this picture.

To the exhibition of 1833 Leslie sent three paintings, "Tristram Shandy recovering his lost Manuscripts," "Mother and Child," and "Martha and Mary before Christ." Of these the first was the most successful; "the earnestness and anxiety of poor Tristram, as he unfolds each crumpled

scrap of paper, mixed with anger and vexation, was the very acme of excellence and truth; and equally admirable was the expression of the poor confused and perplexed grisette, as, with cheeks reddened with blushes, she untwists her hair out of the precious MSS. The sacred subject clearly manifested that the genius of the artist does not lie in this direction; the "Mother and Child" is a simple bit of nature, pleasing and graceful.

It was, we believe, in the autumn of this year that Mr. Leslie embarked for America, to fill the post of Professor of Drawing, at the Military Academy at West Point, to which he had been appointed by the government of the United States, as we have already intimated. The occupation, however, was not congenial with his tastes, and after a residence there of about five months, he returned to London, which he has ever since made his abode. His absence from England prevented the appearance in the following year of anything from his pencil; but it probably suggested the idea of one of his pictures, "Columbus and the Egg," exhibited in 1835; his other work exhibited at the same time, "Gulliver's introduction to the Queen of Brobdingnag," is in the collection of General Wyndham, who inherited the Petworth property on the demise of the Earl of Egremont. These two pictures added little to

the reputation of the artist, though they detracted nothing from it. The subjects are devoid of much interest. "Autolycus," from the "Winter's Tale," the only work he contributed to the Academy in 1836, is a small picture, rather slight in treatment; it is the property of Mr. Sheepshanks, as is also "Florizel and Perdita," from the same play, exhibited the following year with a scene from "Old Mortality,"—"Charles II. and the Lady Bellenden breakfasting in the Tower of Tillietudlem;" in the latter work the artist once more shines in his purest light; the portrait of the proud and formal old royalist dame being represented to the life. In 1838 appeared the "Principal characters in the 'Merry Wives of Windsor' assembled at the house of Mr. Page;" we must confess our recollection does not enable us to speak with any certainty of this picture; whether or no it is a repetition of that painted in 1831, and of which we have already spoken as belonging to Mr. Sheepshanks, or whether this is actually the work which that liberal patron of British Art possesses; we believe, however, our former statement is the correct one.

"Who can this be?" and "Who can this be from?" exhibited in 1839, are the titles of a pair of pictures either painted for Mr. Sheepshanks or purchased by that gentleman from the walls of the Academy: both are love scenes, happy in conception, but rather low in colour. "Sancho

Panza," another picture of this year is "the embodied idea of the Prince of Barataria, when cheated of his meals by order of the physician." His fourth work of the same period, "Dulcinea del Toboso," a pendant to the former, scarcely realises the character of Don Quixote's *inamorata*, the artist has represented her as a stout rosy country-girl. Mr. Leslie's only work of 1840 was a portrait of the late Lord Chancellor Cottenham, an admirable likeness vigorously painted: in 1841 he exhibited three pictures, "Le Bourgeois Gentilhomme," the scene where M. Jourdain, fencing with the maid, receives a thrust of the foil from her: it is a fine example of character, full of point and humour, but not agreeable in colour: we remarked of this picture at the time,—“Mr. Leslie's views of life are so shrewd, and his perception and portraying of character so strong, that he is borne safely through peculiarities of colour that would seriously injure a lesser man:” these observations would occasionally not be considered out of place even in the present day. "Fairlop Fair," the next on the catalogue of this year showed much that is excellent, but as a whole is not so satisfactory as many other works from the same hand. "The Library at Holland House," is a skilfully arranged and elaborately finished picture, into which are introduced portraits of the late noble owners of this fine baronial mansion. In a "Scene from Twelfth Night," exhibited in 1842, Sir Andrew, Sir Toby, and his niece's chambermaid are introduced with that fine perception of individual character which the works of this painter pre-eminently manifest: in colour also this

work is unexceptionable. Mr. Sheepshanks possesses the other picture of this year, the "Scene from Henry VIII.," in which Queen Katherine entreats her attendants to divert her troubled thoughts with music; it is a beautiful and touching composition, or, as Dr. Waagen says of it, "the expression of sorrow in the queen is very good, and the gloomy keeping of the whole is congenial."

The contributions of Mr. Leslie to the exhibition of 1843 were more numerous and varied than at any preceding period: the first in the list was a "Portrait of Mr. B. Travers," the late eminent surgeon; the next one of those difficult subjects that test the skill of the greatest artists, "The Queen receiving the Sacrament at her Coronation:” it is too well known to the public by the engraving of Mr. S. Cousins, R.A., to require any comment or description; suffice it to remark that the picture was a triumph. The third was a subject from the "Vicar of Wakefield,—‘Virtue, my dear Lady Blarney, virtue is worth any price, but where is it to be found?’” it is a genuine illustration of the characters Goldsmith has drawn with so much truth and power; the fourth was a portrait of Mr. H. Angelo; and the last a "Scene from Molière's 'Le Malade Imaginaire;’” “admirably represented,” writes Dr. Waagen; the picture is one entirely of character, and in the spirit in which it is painted has been very rarely equalled and never surpassed: it belongs to Mr. Sheepshanks, who, as our readers will have perceived, is especially “rich in Leslies.” A "Scene from 'Comus,'”—“Hence with thy brew'd enchant-

SIR ROGER DE COVERLEY GOING TO CHURCH.

[Mason Jackson.

ments, foul deceiver," a composition for one of the frescoes executed in Buckingham Palace, was one of Mr. Leslie's exhibition pictures in 1844, but it was evidently a subject whose style is not in harmony with the painter's mind; not so, however, with his other contribution of this year, his old and favourite subject "Sancho Panza in the Apartment of the Duchess," in which appeared several striking improvements upon his former pictures: we presume this is the repetition we have spoken of as the property of Miss Rogers. In 1845, he sent the "Heiress," a composition of three female figures in a richly-furnished apartment, but they scarcely afford a solution of the title; and a "Scene from Molière's 'Les Femmes Savantes,'"—Trissotin reading his sonnet to the ladies; the picture, in the collection of Mr. Sheepshanks, is far more sketchy than is usual with Mr. Leslie, but the characters are successfully maintained.

The most important picture exhibited in 1848 was the "Reading the Will Scene, from 'Roderick Random;'" it is a large work, and treated with great originality, but has a heavy appearance in colour, arising from the predominance of black; this, however, is almost unavoidable, from the subject: the work belongs, we believe, to Mrs. Gibbons, of Hyde Park. His other productions of this year were "Mother and Child," a charming little picture, very similar to one we have already referred to under the same title; and the "Portrait of Mr. C. Dickens, in the character of Captain Bobadil." In 1847 appeared "Martha and Mary,"

—a replica of his picture of 1833—in which the figures are substantially and beautifully painted, yet without reaching the dignity of Sacred Art; the "Pharisee and the Publican," equally successful with the former in execution, and treated altogether in a more congenial spirit; and "Children at Play," a sweet little composition of "genteel comedy" by small folk. "Lady Jane Grey," exhibited in 1849, is a graceful personification of her,

"who in her chamber sat,
Musing with Plato:—"

she is thus represented in the picture; and the "Shell," exhibited at the same time, is also remarkable for the refined feeling that pervades the subject—a child, on the knee of its mother, listening to the "echoes of the deep" as they murmur through a shell held to the child's ear by a beautiful girl. "The Masque-scene in 'Henry VIII.'" was one of two works exhibited in 1849; the picture throughout displays much valuable artistic performance: the other, a "Scene from 'Don Quixote,' where the Duke's chaplain, after attacking Don Quixote for his devotion to knight-errantry, and Sancho for his belief in his master, reprimands the Duke for encouraging their fancies, and leaves the room in a passion;" this is unquestionably one of the best works Mr. Leslie has created out of the history of the Knight of La Mancha.*

* To be continued.

THE POEMS OF GEORGE HERBERT.*

THE courtesy of Messrs. Nisbet, in lending us some of the blocks engraved to illustrate the very beautiful edition of the poems of George Herbert, recently published by them, enables us to fulfil the expectations held

out to our readers when reviewing the volume in our January part. The poetry of this original thinker and quaint writer requires not the aid of the artist by way of recommendation, but it becomes especially attractive when his thoughts and picturesque descriptions pass before

the eye as we see them here. Herbert's principal poem, entitled "The Temple," includes reflections upon everything associated with the Church

* THE POETICAL WORKS OF GEORGE HERBERT. Illustrated. Published by JAMES NISBET & Co., London.

as an earthly or a spiritual edifice; the artists have therefore selected from the various subjects contained in the poem such as seem best fitted for illustration: thus the verses entitled "The Church Porch" is adorned with two exquisite designs by Mr. Foster of a small venerable English church and parsonage-house, and a distant view of a similar building, with rustic "tribes going up to worship." To "The Sacrifice," Mr. Clayton contributes "The Betrayal by Judas," and "Christ crowned

with Thorns," both subjects treated with nice feeling and considerable power. The poem entitled "The Agonie," is illustrated in a truly devotional spirit by a representation of "Christ praying in the Garden of Gethsemane," also by Mr. Clayton. The two lower engravings on this page, by the same hand, are respectively prefixed

to the poems "Vanitie" and "Faith": the two upper, by Mr. Foster, to those entitled "Employment" and "Grace": these will afford sufficient evidence of the character of the illustrations, which are lavishly scattered over the pages of this charming book. We regret that the form of Mr. Noel Humphreys's graceful floral "headings" and "side ornaments," prevents our introducing examples of them also.

FRENCH CRITICISM ON
BRITISH ART.

M. MAXIME DU CAMP.

DURING the successive months of the late Universal Exhibition, we took especial care to present to our readers in general, and to our artistic friends, more particularly, copious selections from the ephemeral criticisms of the French daily press upon our works of Art. They were of interest from their freshness—curious from the surprise of which they were the vehicles; but, for the most part, distasteful from an ungenerous levity, by which they were characterised. By the latter, what might have been a useful lesson, was marred: for it must be admitted in the abstract, that it should have been a wholesome occurrence for our painters and sculptors, to have had their works passed through the process of a Continental criticism. Even in literature, such strictness might be of importance in reference to general structure and the general purport of our productions, although valueless in appreciating delicacies of verbal expression: but in Art, where the language is cosmopolite, where all aim at the same end through precisely the same means, the utility of such foreign review, if fairly carried out, cannot be a subject of doubt. However distinct may be the varieties of style between the artists of the same country, yet, if they are habitually secluded from foreign competition and its comparisons, habitually mingled together in schools and exhibitions, pervading peculiarities will insensibly creep in amongst them, and gradually establish national mannerisms. It behoves the British artist, in his island seclusion, to accept and welcome with as dispassionate feelings as he may, the notes and comments with which the foreign observer makes up an estimate of his merits. Actuated by this conviction, we present our readers with a chapter on the English portion of the Beaux Arts Exhibition, from the general criticism of Mons. Maxime Du Camp, which was not written with precipitancy, or the flippancy of the newspaper press, but deliberately digested, as deliberately published, and to which, in the Parisian circles, has been given the authoritative position amongst the various brochures on the Exhibition which have appeared. Mons. Du Camp holds an honourable place amongst the literary men of the day in France—in both prose and verse—but more particularly as an Oriental traveller. His present work indicates how deeply and devotedly he has interested himself in Art. It will, moreover, afford cogent evidence that he has no vain predilection for the schools of France. For them, in fact, he has reserved his severest and most searching strictures; so that to the British artist, who would know precisely wherein they sin, we can safely commend the perusal of this large octavo. After having given nine out of fifteen chapters to his own countrymen, Mons. Du Camp thus, in his tenth, deals out his impressions of our oil painters in the Exhibition.

"We will not," he says, "reproach English painting, as we have the various schools of France, with the charge of imitation. In truth, our neighbours across the Channel have carried into Art the essential originality which segregates them, and enables one to recognise them at a glance, amongst all other people. There is in their painting, as in themselves, a something original, especial, *eccentric*, which attracts attention. It has the flavour of their soil. It is neither Flemish, nor Spanish, nor Italian. It is English, Protestant, methodical, and, up to a certain point, is adapted for them alone. If Reynolds, Gainsborough, and Lawrence have held by a tradition of Vandyke portraiture, it must be admitted, on the other hand, that in *genre*, Britain has spurned all foreign influence. Here and there may be felt in that class, reminiscences of Hogarth; but these are national, and owe no debt to the celebrated masters of Rome, Florence, Antwerp, or the Hague.

"So habituated are we in France to see in the works of our best artists, but copies more or less faithful of by-gone masters, that our first

feeling in proceeding down the long gallery containing the English portion of the Exhibition, was that of surprise. It presented to us an originality thoroughly made out, and in effect, subject-matter for prolonged astonishment. This originality has, however, its vice, which we must at once notify. In their excess of Anglicism, they frequently have no outward human sympathy. Accustomed alone to paint the strongly marked features of their peasantry, the visages of their frigid aristocratic men with two formal lines of whisker, and the rose-blossom carnations of their young countrywomen, they see in all mankind but the British type; they stumble into a predicament similar to that of the laureates of the Villa Medici, who in all their productions, gave but an imperceptible repetition of the types they had studied at Rome, and inflict upon all parties in all their works, visages wholly and entirely English. This emphatic defect, which might be easily avoided by a generalisation of study, is especially noticeable in the 'Sancho Panzo,' and 'The Duchess' of Mr. Leslie. 'Esther's Emotion' of Mr. O'Neil, and in the 'Vintage in Medoc,' of Mr. Uwins. In these three scenes, in one of which the dramatis personæ are Spanish; in the other, Jewish; and in the third, French, the actors bear, one and all, the type of the English race. This is an overstrong disguise of truth, and mars the interest of each subject.

"Notwithstanding its first-class distinctive qualities, its sincerity and lofty disdain for the old continental schools, British painting has something in it diminutive, which recalls the minute but effeminate elegance of the Keepsake engravings. It is almost always deficient in imagination—we feel that it wants a *libretto* to inspire it—that it is less an original text than a commentary; in a word, that it but too willingly levels itself to the function of illustration. To display itself, it opens Sterne or Goldsmith; it is literary to excess; but, while being so, it lingers ever within the precincts of fact, nor ever dares to risk itself in those of philosophy. So it only presents us with works of *genre*, and with little of historic reference. In this respect, it corresponds well with the wants of its epoch: morally, it moves in harmony with the stories of Dickens; and materially, it has the adroitness to adapt itself to the narrow exigencies of the dwellings it is intended to decorate. It excels in depicting interior scenes, appropriate to a country replete with families, where they have evening prayers in common: it seems made to adorn walls lit up by glowing coal-fires: it is essentially adapted to be a portion of comfortable chamber furniture, and not to shed honour upon extensive galleries. In the matter-of-fact manner in which it is elaborated, there is a something of richness and glitter; a furbishing up, which is, as it were, its national stamp. It is of the earth, earthly; always exact; often amusing; never elevated. It makes one smile and talk; but never promotes deep thought, much less imaginative reverie. In a word, it is positive, or precise, like the people amongst whom it has had its being. It comes within the grasp of artists who have talent,—much talent, but nothing of genius. Their literary equivalent may be found in Sheridan, in Dickens, in Fielding, in Walter Scott; but not one amongst them can enter into comparison with Shakespeare or Milton, or even Lord Byron.

"Cold and calm by acclimatised temperament, English artists never allow themselves to be borne along by those excitements of imagination, which frequently but terminate in some violent miscarriage—but which also sometimes attain the sublime—and which, at least, intimate the pursuit of an ideal. They appear only to labour in virtue of certain premonitory rules, the observance of which is sure to lead them to their desired result. With them all is regular, foreseen, directed, and detailed. It is obvious that they paint with colours of incomparable quality—ground between slabs of porphyry, hard and fine-grained as the diamond—with marvellous vehicles, with exquisite varnish, and with pencils plucked from the rarest martins' tails. They should, like Gerard Dow, after having withdrawn the veil which covered their pictures, stand motionless and long, to avoid agitating the dust.

"But devotedness to minute precision of finish frequently narrows the import of their works, for on their canvas each part has for them an equal importance—a shoe and a face are equivalent. This over-wrought minuteness of detail which degenerates into foible, fatigues the scrutiny and dissipates the interest of the spectator. I shall cite as an example of what I assert, Mr. Millais's 'Return of the Dove to the Ark.' I care but little for the picture, overlaid as it is with ill-harmonised rainbow and blue tints, and I should not have at all noticed it had it not presented, in the mode in which the litter, which covers the floor of the ark, an extreme example of the abuse of detail. This is in truth an absolute illusion: it is not art, but coloured photography. Every sprig of hay and stalk of straw, each hair from the hide of ruminant, or feather from wing of bird, is drawn and painted up to reality. Neither is there a particle of exactitude omitted in the erect figures of the two girls, who almost press in their hands the messenger dove. The almost imperceptible reticulated lines which mark their hands, the lashes of their eyes, each individual hair of their heads, are given with astounding precision. But this is all frigid and shallow. The obvious effort which, after all, is in default of its model, is only painful. The same opinion holds good respecting the 'Ophelia,'—a strange, almost ridiculous, and assuredly puerile production, representing a young female gradually sinking in water, which seems wholly undisturbed by the proceeding. All the slender grasses, all the small flowers, all the delicate plants, that grow on the banks of streamlets, are, as it were, gaily accumulated round this wax doll, that drowns itself, as unlike as possible to the Ophelia of the poet. This picture may be compared to an enamelled toy. To the two, I strongly prefer 'The Order of Release,' which, notwithstanding the undue interest given to some of its accessories, such as the falling primroses, the coat of the prisoner, and the dog's tail, represents, nevertheless, a scene vivid, impassioned, and true. If we have spoken at length of Mr. Millais, it is not because we accord him an estimate of great importance, but because he sums up plainly an error common to the majority of his brother artists, the immoderate and irrational abuse, which leads quickly to puerility, and consequently to ennui. "All, however, are not of this class, and some have had the genius to unite a high measure of precision in execution with breadth of sentiment. We will cite, as an example, Mr. Dauby and 'The Evening Gun.' In a solitary roadstead, near the mouth of a river, where the sombre shadowy forms of some lofty constructions are visible, a ship rides at anchor. The sea is calm, no breeze perceptible, the tide scarce ripples by the buoy, the ocean breathes tranquilly like the breast of a living sleeper. A flight of those indefatigable birds, whom sailors call 'souls in pain,' skim along brushing the water's surface with their light, silent wings. At the horizon, where the long clouds lie like immense alligators, the sun sinks to his couch, crimsoning the sky with his strong colours. Against this light gradually fading away into a pale green hue, the ship shoots up its black masts, its yards with sails clewed up, its hallions and ropes all motionless. From its sides a gun-shot has issued, rolling forth thick and heavy volumes of smoke, which the wind carries not away, and which seem as though they should lie heavy on the peaceful waters. This is the signal that day has closed, and the night commenced. They are about to set the watches; they, who will, at regular intervals, hail with an 'All's well, starboard,' 'All's well, larboard,' and the sentinel at the main-mast will reply, 'Be awake at the cat-head.' There is, in this composition a true poetry, which gratifies the more, inasmuch as it is rare amongst English works of Art.

"The man who with greatest strength signalises the British Exhibition, who towers with unequivocal endowment above his brother artists is, in our opinion, Mr. Mulready, who in England enjoys an established popularity, and here, on this occasion, has in some of his works left far behind him the majority of French painters in the class *genre*. His *dramatis personæ*,

well and vividly before us, are all in appropriate action; they are not posed but in life-like freedom; they are engaged in the unaffected movement of a scene, having as little resemblance as possible to those of Meissonier, who always have the air of having put on new suits of clothes, and place themselves in special attitudes to catch the eye of the amateur. The canvass of Mulready has nothing whatever in common with this *Sunday-sided* style. It is full of life, sincere and serious, arriving ever at the realisation of truth—truth, it must be admitted, in action of narrow interest, without greatness of thought, without elevated aim, but from its simple manifestation affording proof of a remarkable faculty. Of the nine pictures which he has sent to France, we do not hesitate to give the preference to the ‘Whistonian Controversy,’ a subject taken from the Vicar of Wakefield, and which we have already seen with admiration in the remarkable gallery of Mr. Baring, M.P., in London.”

After having vividly described the action of the picture, falling, however, into the singular mistake of making the Vicar young—“*Le jeune Vicar Primrose*,” the critic proceeds.

“The truthful combination of parts in this very simple scene is given with extraordinary freshness; its accessories, such as the rich fabric of the table-cover and the books, are introduced with perfect skill, and, without intruding, increase the general interest of the composition. The colouring of this picture, although inclining perhaps overmuch to a yellow tint is very harmonious, and combines with the other qualities of the diminutive canvass, in rendering it highly valuable.

“We are much less gratified with ‘The Fathers,’ a picture painted after the manner of a miniature, and to which the crude contiguity of pink, blue, red, green, and white tints, gives a twinkling effect. Moreover, the anatomical treatment of its chief figure is dry, a little angular and in parts more meagre than agreeable. But let us add that, perhaps no artist has ever attempted so successfully—gone so far—in imitating the human flesh, in giving those fresh and pearly, those tender and fascinating tints, which invest youth with its most dangerous attractions.”

We must confess that a note upon this comment of Mons. Maxime would be extremely welcome if it could only reconcile the opinions contained in these two last sentences. They assuredly jostle in utter antagonism.

“In landscape—strictly so called, Mr. Mulready is not fortunate. His ‘Blackheath Park’ all dry and crude, reminds one of a large agate stone, on which a mockery of vegetable life is traced. There is neither greatness nor reality in it; it is cold, poor, and without scope.”

The critic has here unhappily overlooked what seems to have been the aim of the master who, it is pretty obvious was, in this instance, making a bold and difficult experiment, wholly apart from the picturesque, viz., to represent a homely landscape under the full effect of a meridian sun. He neither brought to his aid the striking aspect of form in natural objects, nor the equally effective impressions of light and shade. A much more difficult, although ungrateful task, could not have been essayed, and Mr. Mulready has, we should venture to affirm, succeeded in it with a true “*curiosa felicitas*.” “I admire much more,” continues M. Maxime du Camp, “the pretty scene inspired by the precept, ‘Train up a child in the way he should go.’ There, at all events, the landscape is enlivened by a group, which makes one overlook its shortcomings. A handsome child (‘un beau bébé’) ruddy and blond, with neck uncovered, after the manner of English juvenility, is taking his walk, accompanied by his governess and followed by his dog, &c.” Having described the action of the illustration with vivid piquancy, he concludes with the remark, “This is a charming little picture, less delicate in its execution than the ‘Whistonian Controversy,’ but equally happy in its details and general effect.”

Perhaps, let us remark, the general tone of this criticism may prove to Mr. Mulready that, if he is wounded by the fastidiousness of the late Fine Arts Jury, there is yet something of a balm in Gilead.

“After Mr. Mulready we shall place Mr. Webster, who has a leaning towards subjects of a delicate comic vein, and who, from the humour in which he takes them, is obviously of the school of Hogarth. He has none of the dry extravagance, none of the epileptic grotesqueness, which characterises the latter, but he has a finer subtlety of perception, and combines therewith a skilfulness of design and a facile lightness of execution altogether remarkable. He excels in painting children, and, notwithstanding a certain weakness, a sickly paleness of tint, he brings them out happily upon his canvass. ‘Contrary Winds,’ and ‘The Cherry Seller,’ are pretty examples of *genre*, although inferior in power to the ‘Wolf and Lamb’ of Mr. Mulready. ‘Foot Ball’ is his best picture. The crowd of boys who vigorously cuff and jostle each other in pursuit of the ball; the animation of the game, the rough and rapid evolutions of the players, has been studied and rendered with commendable care.

“In the ‘Village Choir,’ which presents a quiet, almost serious aspect of caricature, we find a variety of physiognomies finely discriminated, skillfully grouped, and painted with a life-like reality, leaving little to be desired. Two heads (portraits) are a miniature *chef-d’œuvre*. The aspect, in which the artist presents his subject involved a serious difficulty in regard to tints, with which he well knew how to cope. An old man and his wife, seen only from the bust, are placed in profile beside each other. The latter is pale, with the heavy, dull, pallidness which belongs to certain unhealthy organisations. She wears an ample white cap, with large plaits of tulle, and is wrapped in a tippet of swansdown, which frames her face in a wreath of spotless, snowy foam. The painter has vigorously worked his way through this accumulation of whites, so difficult to be brought into juxtaposition. The physiognomy is kindly, smiling, and full of life. These portraits are good—very good—but they are far from being equal to those of Mr. Grant.”

Never was there a liberal eulogium more gratuitously marred than what has here been set forth, by its conclusion. The common apothegm, “comparisons are odious,” was never more completely illustrated. Mr. Webster is not an ambitious portrait-painter, and the minute and very beautiful work which, under some special inspiration, he thus brought into existence, to be universally admired, in no manner provoked this ungenial piece of disparagement.

“Mr. Grant, carrying out the traditional elements of the styles of Gainsborough and Lawrence, has more of breadth and boldness than the majority of British painters. He unhesitatingly sacrifices a detail, coarsely rubs in an accessory—gives a dash of inexplicable red to a sky, for the purpose of securing a more striking importance to his heads. This mode of proceeding is obvious in the portrait of Madame Beauclerk, and in that of Lady Rodney, but his *chef-d’œuvre* and such it is throughout, is ‘The Ascott Meet.’ Here, on an extensive plain, bordered in the distance with some leafless beech trees, a *réunion* is presented of huntsmen in their chase costume, red coats, cravats black or blue, buckskins, and top-boots. They are mounted and grouped as accidental impulse prompts. Each individual—each horse, is a portrait. It would be difficult to exemplify more variously attitude, action, and physiognomy. I know of no production from our French painters of the chase and horses equal to this inestimable canvass, to which its finely handled colour, although a trifle too grey, gives an indescribable charm.”

It must be suspected that the diminutive “*qu’ici un peu grisâtre*” is forced in here at the end of an even strain of eulogium to save the critic’s credit from a charge of being in an over-melting mood. If there be a prevalent tone in the picture we should rather have named it *brun* than *grisâtre*. However, the mote is detected, and criticism vindicated.

“Amongst the British artists who fain would eschew an English pencil and endeavour to attain something of the present overwrought French style, we must name Mr. Knight. His ‘Wreckers,’

have great but unsustained pretension to vigour. Exaggerated sky tints, physiognomical distortion, and violent contrast of contiguous light and shade, are not always power, and sometimes feebleness. Artists, who have an ambition for these spurious extravagances, may be compared to children, who, concealed behind a curtain, speak in rough tones, to make believe they are men. They wholly fail to deceive. Mr. Knight’s catastrophic subject, in its triple division of action, would have been better if treated with tact, without doing violence to dramatic fitness, and without its ineffective strainings.

“We must prefer, as a specimen of enlarged treatment, the ‘Morra’ of Mr. Hurlstone. This is rather a study of Italian boys than a picture. It seems washed in, as it were, after the manner of a water-colour drawing. Whatever may have been the defects of the model, we have here, at all events, physiognomical expression of a good stamp, and a judicious general effect of colour. But are these Italians? I have my doubts—be that as it may, they have been thoroughly Anglicised by the artist. Mr. Hurlstone would seem to have much studied the works of Reynolds, and to have retained some of their impressions.”

More serious misconceptions will be found and thickly scattered throughout French criticism on English works; but probably one more obvious and amusing than that respecting the identity of Mr. Hurlstone’s Italian boys could scarcely be culled from the collection. Familiar as we are in London, and far more than they are in Paris, with the pleasant-faced little rambling organ-grinder, or, white-mouse exhibitors, with their waxy-brown complexions, tinged with an occasional rusty ruddiness, and their mouthful of snowy teeth, we could not for an instant question their reflections on Mr. Hurlstone’s canvas, or rather his canvasses, for he has made them long since his special property. Moreover, the type is wholly and totally distinct from that of the English. But it would be too much, as in the preceding case, to let the artist off with nothing but commendation, and so pop goes a blank cartridge.

“To return,” continues Mons. Decamps, “to the unequivocal English *genre*, a word on ‘The Widow’s Benefit Ball,’ by Mr. Goodall. Notwithstanding the watery complexion of colour of this picture, which, after all, is nearly the universal peculiarity of English painting, it is an agreeable work, and composed with a degree of care which at times becomes too scrupulously minute. In truth, there is no part of the canvass unstudied—a parallelism between the groups is too obviously wrought out, and is even established between the heads of the two old men, one of whom performs the part of fiddler, at the end of the hall, and the other helps himself to potatoes near the door. There is also an abuse in the introduction of children; they are forced in on all sides to fill up intervals; in other words, they are made to *plug up holes*. Nevertheless, there is an animation, an earnestness, an unsophisticated healthy vivid gaiety realised throughout the whole scene, most agreeable to contemplate. The young man with the naked feet, who accompanies his capers with the snapping of his fingers, is a most successful figure, affording proof of a conscientious study of nature.

“‘The Novice’ of Mr. Elmore is very pleasing. Instead of confining himself, like his brother artists, within the bounds of the narrow romance of familiar facts, he has sought to illustrate a philosophical reflection, and he has succeeded. A young girl, lovely, sad, and pensive, a prey to the struggles of her inner self, is seated, in the garb of a nun, on the little bed in her cell. The neighbouring window is half open, and with the full flow of sunshine, admits the sound of song—of life and youth; for on the other side of the street, it would seem that they dance and are mirthful. She seems to hear with anxiety this joyous excitement, and notices not that in the corridor, to which her open door gives access, an old mother of the convent moves wearisomely along, leaning on her staff, and supported by a sister. In a distant cloister, some stoué crosses are perceptible. All the regrets, all the sadnesses—let us add all the remorse

of cloistral life, have been well combined and depicted on this small canvass. Between these nuptial rejoicings which might have been hers, and the future, which is indicated in the exhausted old woman, the novice, silent, and melancholy, seems to question on which side lies the truth. Oh, young maiden, the Great Master has said, 'Love one another;' he has not ordained, 'Crystallise yourselves in egotism and in fear.'

"Mr. Lance has a great reputation at the other side of the channel, and we are surprised at it, when we see by what pictures it has been attained. We have already noted the tendency of English painters to an abuse of detail. Mr. Lance pushes this infatuation to its utmost bounds, and thus voluntarily dissipates the charm which his pictures might otherwise inspire. The 'Village Coquette' is a case in point. A young, pleasant-faced girl is engaged in an apartment of a farmhouse—a simple scene that should have been simply treated. Far from that, the artist, by accumulating round his sole personage, accessories upon accessories, diminishes the interest naturally attaching to her. He has brought into play all the resources of his talent—a talent unquestionable—to paint a petticoat of satin cross-stitched, a flower-pranked gown, high-heeled shoes, and the silken kerchief of his coquette. Let that pass; but why give so much importance to the structure of a sweeping broom, of which each particular hair is presented distinct—to a book, which lies forgotten on a stool, to the milk-bowl, to the image pasted against the wall, to the tureen full of water, to the horn suspended by the key, to the stairs which conduct to another chamber, of which all the furniture is perceptible? The eye passing from one detail to another, overlooks the principal object of interest, and ultimately preserves but the reminiscences of inconceivable dexterity of handling, infelicitously misapplied. And then, when I scan this picture with care, I perceive that the face of the Coquette is the part of it comparatively the most carelessly treated. These eye-deceiving efforts are not made to gratify; they want simplicity, and impart and produce no other impression than the spectacle of a *tour de force* painfully elaborated. Much the same comment I must make on Mr. Lance's 'Red Cap,' where I see a cabbage, of which all the fibres are painted minutely, although with over-much of glisten; and a dead drake is made out feather for feather. The title is elucidated by a little monkey bearing a red cap, which is engaged in scrutinising a large vase full of onions and tomatoes."

This cannot be considered a candid rebuke, omitting as it does the extenuating fact, that Mr. Lance has but sinned in common with many of the first masters of the Flemish school. In mere minuteness of finish, which allows no object in a domestic scene, however small, to escape an elaboration *ad unguem*, he neither has nor could exceed their microscopic handling. The class of Art, it need not be said, ranks comparatively low, and lower still where it fails to combine artistic general effect with scrupulousness of execution.

"Amongst the English *romance-painters* we must further range Messrs. Frith, Egg, Horsley, Philp, and Solomons, and having done so, we come at length to the favourite artist of the United Kingdom—Sir E. Landseer. His pictures, rendered familiar to the public by engravings, have acquired for him general renown; but, in justice, we should affirm that a considerable portion of his fame should revert to Messrs. Lewis and Thomas Landseer, his accustomed engravers. In a word, the engravings and aquatints copied from his pictures gratify us more than the pictures themselves. These engravings have in them a something of illumined softness and delicacy which is not to be found on the canvasses. Whence this incident? It is owing doubtless to the dry, hard, and over-brilliant palette of the painter. An easy opportunity for comparison has been offered by the Universal Exposition. We can at once see the picture and engraving of 'The Sanctuary,' which every one has remarked in the print-shop windows of the Boulevards. The engraving, which is from the burin of Lewis, is very striking, and executed

with great truth and depth of feeling. The time is evening—that doubtful interval of twilight when nature seems to yield to general repose. A stag comes forth from a lake, where he has been bathing, and utters a gentle sound as he frightens into flight a train of wild ducks, which had sought a resting-place amongst the adjacent rushes. The drops of water fall slowly from his skin. In this solitude—in this sanctuary—all is calm, sad, and as though Nature were moved to pity. Now, if we look at the picture, this impression will be effaced on finding a sky too clearly bright, against which the form of the silhouette of the stag is over-darkly massed—the foreground merged in blue and questionable shadows—the waters motionless, hard and like crystal, the drops falling from the animal seeming like icy stalactites. I do not find in it the life-like expression—the subdued sentiment, which I have admired so much in the engraving."

A critic figures assuredly in a very false position, who, while dispensing a specially severe sentence, falls into an obvious and gross error, in respect to the subject-matter of his comments. He turns the tables on himself with a vengeance. Hence, for instance, can anything be more pitiable than Mons. Du Camp's perfect innocence of the true meaning of "The Sanctuary?" All that he has made of one of the most charmingly poetic and touching compositions that ever came from the hand of artist, is simply a stag taking a bath, and on his exit from the water (though why not on his entry, it would be difficult to suggest) startling a family of wild ducks. It quite escapes his critical eye, that the noble animal, like his fellow in the forest with the melancholy Jaques, has just won his life from the remorseless hound and huntsman; that, from the far-off shore, whose hills loom in the middle distance, he has made his way through the calm lake—*leaving his trail* upon the face of the waters—to this island Sanctuary, whither he cannot be pursued. A more effective transformation of poetry into prose—of gold into lead—could scarcely be conceived.

The critic proceeds. "So also, of all the E. Landseer works, which this exhibition presents, we prefer the 'Night,' and its pendant 'Morning,' as engraved by Mr. T. Landseer."

Having described the action of these compositions, he thus trenchantly proceeds:—"No picture painted by Sir E. Landseer produces an equally powerful effect with that of these engravings—more particularly that which is entitled 'Night.' From these remarks, it must not, however, be concluded that we wholly condemn the painting of Sir E. Landseer—that would be a wrongful interpretation of our opinion; but we do hold it to be especially successful in ministering to engraving. It proves that the burin can sometimes be superior to the pencil. In a word, Sir E. Landseer seems to us to be a *gentleman*—highly accomplished as an amateur, rather than an artist, in the serious acceptance of that title. At times he imparts a genuine expression to his animals—as, for example, in the picture of 'The Brazilian Monkeys.' On a small canvass, these are represented mounted on a pine-apple, and watching with uneasiness a wasp humming near them. At times, too, he attains to a striking correctness, both of contour and colours, as in 'The Tethered Ram,' which would be perhaps faultless but for the cold and inanimate landscape by which it is surrounded. But at times, too, he is perfectly unceremonious with truth of nature, when it is his object to make, at any cost, his animals give expression to variety of feeling. Then, indeed, he recognises no bounds of possibility. We take, as an instance, 'Jack in Office.' All the dogs, which yearn to move upon that attractive table, of which the terrible and faithful 'Jack' is guardian, have aspects of timidity, gluttony, and mendicancy, perfectly studied; but, nevertheless, in most of them the eye, from an overwrought effort at expression, is no longer that of the animal—it is human. This defect is especially remarkable in the dun spaniel leaning against the wall. This is not vanquishing the difficulty in the subject, but avoiding it: it is a sleight of hand, and in Art these juggleries should

be severely proscribed. In one word, Sir E. Landseer was a greater, a more important person, in our eyes, before than since the Universal Exposition. To attain his full value, he has need to be translated: his pictures are themes, to which engraving alone gives their complete development."

But that the book of Mons. Maxime Du Camp made its appearance before the awards of the Beaux Arts Jury had transpired, it might have been suspected that this piece of criticism had been put forth merely in contradiction of their implied opinion, and in the indulgences of a self-sufficient opposition. It stands, however, in unimpeachable priority.

The remark respecting the physiognomical expression of the dogs we take to be wholly incorrect and unfounded. Sir Edwin Landseer has well illustrated what all close observers of the dog must have noticed—viz., the extraordinary variety and subtlety of feeling which is indicated by its eye.

If Mons. Du Camp would see a human eye figuring in the head of a noble brute, we commend his attention to the horses of the "divine Raphael," or Da Vinci.

The critic proceeds, and falls into the thoroughly ludicrous error disclosed in the following paragraph:—"Sir Edwin Landseer has some imitators, who, as happens ever in such cases, copy by an exaggeration of his defects. Mr. Hunt in his 'Strayed Sheep' has tried to be more subtle, more minutely particular than *his master*, and he succeeds, through the power of false and fantastic tints, in completing a picture, which seems as if beheld through a solar spectrum, and is curious from the singularity of its discordant tones of colour."

Sir Edwin Landseer will probably be not a little surprised to find that, after all, he is the parent of the school of Hunt and Milais, and that Perugino and Van Eyck, to whom the honour has been freely assigned, must vanish back, poor slighted shades, to the shores of the Styx. This will surely console him for the foregone severities of his French critic.

"Exclusively imaginative painters are rare in England, and in truth I see but Mr. Paton who merits this little-to-be-envied denomination. 'The Quarrel of Oberon and Titania' is a canvas whereon the artist has brought together all the reveries which Shakspeare has crowded into 'The Midsummer Night's Dream'—Puck, Robin-goodfellow, Butterfly, Spider's-web, Mustard-seed—the whole tribe of genii and fairies flit forth from the calices of flowers—glide through the grass and swing themselves on the flexile branches of the trees. It is a wide composition, abounding with various little episodes—well painted generally, well designed, and well grouped in detail, notwithstanding the obvious difficulties of the subject—and would have been extremely attractive had not its three chief entities, Titania, Oberon, and Puck, been but indifferent conceptions, over-substantial and disproportionate. A thousand charming minutiae, let us hasten to add, make amends for this defect. We dimly discover marvellous réunions in the corolla of the convolvulus—sweet salutes are interchanged under the petals of the rose; all is harmony and fragrance—all lightsome joyousness, notwithstanding the terrible drama which is being enacted in a corner, between an overgrown spider and a gnome pale and distorted by fear. The general tone of colour in the picture is sufficiently agreeable, although here and there it has some sharp notes not quite in harmony."

"These are the English pictures by which we have been most struck. It would be superfluous to speak of others, all of which follow with inferior merit those we have named. If truth in Art is not to be found in the coarse manner—loose beyond bounds, and even incomplete, behind which the French School, under the pretext of breadth of style, hides its feeble decay—neither is it to be met with in the petty precision, cold, detailed to puerility and even to Chinese in finish, of English painting. Where then does it reside? Where is the material—the executive truth of Art? Patience! We shall, perhaps, find it in the Belgian pictures of Leys; and at Dusseldorf, in those of Knauss."

THE WOODMAN.

ENGRAVED BY E. ROFFE, FROM THE GROUP BY
SCHWANTHALER, IN THE COLLECTION OF
THE DUKE OF DEVONSHIRE.

It is not a little remarkable that the talents of three of the greatest modern artists of Germany were in their youth held in so little estimation by one who was, or ought to have been, a judge of such matters, that they were recommended to seek some other profession than that they desired to follow. Peter V. Langer, when director of the Academy at Düsseldorf, dismissed Cornelius from the schools of that Institute as "a young man without ability; and when Langer became subsequently director of the Munich Academy, he discharged Heinrich Hess for the same reason, and advised the mother of Schwanthaler to take her son from the Academy because he possessed no genius for sculpture. Schwanthaler's appeal from the dictum of the director was to the king, Maximilian of Bavaria: not directly, but it so happened that one of the royal equestrians, having observed the young artist modelling the forms and attitudes of horses, recommended him to his majesty, who engaged him to model designs for a dinner-service to be executed in silver, which service was to be ornamented with *bassi-relievi*, taken from Greek mythology. In this way originated the first work of Schwanthaler, the "Entrance of the younger Deities to Olympus."

By this time Cornelius, another of the rejected by the director, had arrived in Munich to undertake the decorations of the Glyptotheca, and no sooner had he seen these works of Schwanthaler, than he engaged him to execute several *bassi-relievi* for the same edifice. The young sculptor immediately set out for Rome, that he might, we presume, the better perform the task assigned to him, for sculptors very frequently seem to possess the notion that the atmosphere of the "seven-hilled city" is more favourable to the satisfactory execution of their works than the air of any other place: at all events Rome affords facilities for study which are nowhere else to be found. In a year or so Schwanthaler returned with two graceful *bassi-relievi*, the "Birth of Venus," and "Cupid and Psyche," which are now in the Glyptotheca, as well as several others of a later date.

It is unnecessary, even had we space here for such a purpose, to refer to the multitudinous works of this sculptor: the pages of the *Art-Journal* have at various times recorded much that he did, and we shall, doubtless, hereafter find occasion to refer to them. We therefore pass on to notice the work engraved here under the title of the "Woodman," a name which, in the absence of any other, we have given to it. On applying to the Duke of Devonshire, the owner of the group, for its proper title, his Grace favoured us with the following remarks;—"Schwanthaler never would give a name to the group which I consider his *chef-d'œuvre*; when he planned it with me he was contented with calling it 'A Nymph caressed by a Huntsman.' When on his deathbed he gave directions that he might be carried to look at his work, which was undergoing the completion of some minor details by his workmen, he made his brother write to me to express his complete satisfaction; adding, with a kind of pun upon his name, that I should be in possession of Schwanthaler's *Schwanen-gesang* (dying strains)."

The group indicates a mere fancy of the sculptor rather than any mythological subject: the axe in the hand of the male figure is an attribute of the woodman's occupation—not of the huntsman's: the female figure, with a kind of lozenge-shaped graving-tool in her hand, and the lute at her side, may possibly symbolise the Arts; but it seems impossible to give a correct definition of the work. The composition is fine and shows genius of a high order: we must admit, however, that it loses much of its beauty and gracefulness in the engraving, the peculiar construction of the group, from whatever point of sight it is viewed, presenting some obstacle in the way of efficient translation.

THE BRITISH INSTITUTION.

EXHIBITION—1856.

THIS exhibition was opened to private view on Saturday, the 9th of February, with a catalogue of 559 works of Art, of which sixteen are sculptural. The strength of the collection lies, as usual, in its landscape and genre productions, of which many of the examples are of a very high degree of excellence. To this institution must be given the credit of having introduced to the public some of the most eminent painters of our time; and now we continually find on its walls early works which promise in their maturity golden fruit. There are, indeed, of these earlier pictures many, infinitely preferable to others of a subsequent period, painted in a mannered and vitiated taste. An essay in Historical Art by Sir George Hayter is, perhaps, the only production of its class in the present collection; the subject is "The Martyrdom of Ridley and Cranmer." A very remarkable production is an oil picture by Haghe, the first, we believe, he has ever painted in oil; it is "The Choir of the Church of Santa Maria Novella, at Florence," which we shall notice according to its merits in its proper place. Inapproachable as this painter is in his own department of Art, we cannot help rejoicing to find him exhibiting in oil. We have often regretted that there was not more cabinet sculpture executed by the artists of our school; such works might be seen to the utmost advantage here, without being overpowered by sculptures of magnitude. In works of this class, and cabinet bronzes, we are very far behind our continental neighbours. We know that many pictures are annually rejected from this institution, from want of room; perhaps not more than one-third of those that are offered for exhibition are hung; it cannot, therefore, be well understood wherefore the exhibiting space is not increased, especially as it is known that the funds of the institution are ample. Among the smaller pictures are some gems, such works as are worthy of being painted on a large scale; while, on the contrary, several of those which are large should have been put upon small canvasses; a few of these we shall instance in the course of our notice.

Of the value of this institution there is no doubt; but it is quite as certain that it is not made as serviceable to Art and artists as it might be. Of late years, however, it has undergone some important improvements; not the least of which is the reduced cost of the Catalogue, and the marking on it the prices of the pictures that are there offered for sale.

The institution, indeed, cannot fail to be regarded as a valuable auxiliary to the societies that are more exclusive in character: it is "open to all;" and has been undoubtedly of much value to "the profession" generally; the more especially as it takes place before the commencement of the ordinary Art-season.

No. 1. 'A la Ducasse, Pas de Calais,' F. STONE, A.R.A. A study of two French peasant girls—*très coquettes*—and very ready at repartee with the spectator. Twenty painters might have studied the same figures without being able to make so much of them; the body attire is common to the whole of France, but the head-dress is striking and admirably managed. We observe more of texture in the flesh than this painter has usually shown. Wherefore, by the way, a French title? is there nothing in the vernacular good enough for the nonce?

And surely these "peasant girls" are not of France, but of England, bearing evidence of the high blood of the English aristocracy.

No. 2. 'The Bay of Baïæ,' G. E. HERING. The beauty of the place as it is, is very different from that of the past, when Baïæ was studded with the palaces of the luxurious subjects of Augustus. We see Vesuvius in the right distance, and the broken line of coast trends across the picture, closing the horizon with a variety of forms; but the sentiment of the picture resides especially in the nearest section, where is seen a boat, but without any sign of life, with the exception of some sea-birds busily fishing. Their presence is an intrusion; they disturb the intense tranquillity of the scene.

No. 4. 'On the Seine,' A. MONTAGUE. A small sparkling picture, presenting a view of the Seine a little above Rouen, of which the spires, St. Maclou, and the Cathedral, appear on the right bank.

No. 5. 'A Morning's Sport at Slapton Sea, Devonshire,' H. L. ROLFE. The result is a well-conditioned jack, some perch, and chub, all painted with the truth, which ever characterises the piscatorial essays of this painter.

No. 6. 'Luna o'er the Ocean playing,' C. ROLT. The idea is realised by a nymph-like figure, which, together with the drapery, constitutes a crescent form, but the effect is enfeebled by the necessity of communicating to the whole a luminous appearance. The title is affected, but there is much sweetness in the manner of treating the subject.

No. 8. 'Sion, Canton Valais,' G. C. STANFIELD. Nothing can exceed the real substantiality of the foreground objects of this artist. These walls and buildings are of veritable stone, and the ground we tread on is a most satisfactory base; but to a certain degree the same solidity is carried into distance where we want atmosphere. On the right of the composition rises a hill crowned by a monastery, and beyond lies a mountainous distance. The whole is rendered with the utmost care, which is, of course, most observable in the foreground.

No. 9. 'Orchard Intruders,' F. UNDERHILL. Clearly a misnomer, if there be any difference between mere intrusion and absolute robbery. The subject is the robbery of an orchard by a triad of village truants; one of whom, on the wall of the orchard, is the actual thief, while the others receive the tempting spoil. The figures are more carefully made out than any we have hitherto seen in the works of the painter, but the effect is injured by the breadth of chalky wall against which they are relieved.

No. 16. 'Severe Weather,' R. ANSDALL. This is a large work—the subject, we think, is better suited for a small picture. The incident represented is a Highland shepherd rescuing some sheep that are, we presume, almost frozen to death; this, at least, must be the conclusion, because the drift is not sufficiently deep to suppose that they have been overwhelmed by snow. The shepherd's companion is a very handsome black collie, regarding with earnestness and intelligence every movement of her master. Each item of the composition is distinguished by the most scrupulous truth—the man, the dog, the sheep, and the features of the scenery; but the subject, as we have suggested, is not sufficiently important for a large picture.

No. 17. 'A Cool Day in Venice,' painted on the spot, E. W. COOKE, A.R.A. There is for the painter an endless festival in Venice, but it should be remembered that spectators do get tired of the everlasting Ducal Palace, the columns, the Campanile, the library, the Dogana, and the church of

THE WOODMAN.

ENGRAVED BY E. ROFFE, FROM THE GROUP BY SCHWANTHALER.

IN THE POSSESSION OF THE DUKE OF DEVONSHIRE.

San Giorgio; we have not, like the Doge, married Venice and her sea for ever; *sempre Venezia* is as bad as *toujours perdrix*. It is true we know of nothing characterised by the venerable majesty of the City of the Sea, but nevertheless its luxuries pall upon the appetite. To say that the buildings are the same as we have seen them a little short of a thousand times, is true; but it is not true to say that they are always painted thus; we have here an extraordinary finish worked out in part "on the spot," everything being sharp and palpable, because the atmosphere here is like a lens. Farewell ye storied palaces, till we meet again—on the side wall here, and in the next ensuing ten exhibitions of the season, under many a various aspect. This is a cool impression. "Marry! we shall have hot days enow!"

No. 21. 'A Tale of the Crimea,' J. E. HODGSON. A small picture containing many figures, principally an audience listening to the narrative of a wounded soldier; the subject is well sustained.

No. 22. 'Azaleas,' Miss MUTRIE. These flowers are charmingly described; the manner in which they are worked out is as new as it is effective and truthful.

No. 23. 'Sunset in the Meadows,' T. S. COOPER, A.R.A. Every blade of grass on this familiar hummock, every dock, and every sprouting weed, we recognise. As for the cows, they are infinitely long-lived: it is twenty years since those animals were in their calfhood, and they will yet live as long as the artist aspires to shine in the milky way.

No. 24. 'Scene from the Gentle Shepherd,' W. UNDERHILL. The well-known subject—Peggy and Jenny listening to the shepherd's flute. The group is seated under a tree, and the expression of each accords with the sentiments expressed in the bleaching scene. These argumentative rustics may profess to love sweet sounds, but the collie is the best listener; he is the real philharmonic philosopher. Ramsay makes these maidens too well read in the ways of a heartless world, though otherwise genuine enough in pastoral simplicity—here the sentiment is a little too scenic.

No. 31. 'A Study,' J. LUCAS. A very modest title to a work far more worthy of an ambitious name than hundreds for which distinction is sought in by lofty association. It is a life-sized head and bust of the Magdalen class, very successful in depth of expression.

No. 35. 'On the River Mole, Surrey,' G. SANT. We have not before observed any production by this painter, who has attained to a certain amount of experience without being publicly known. The subject is a good example of the character of the "reluctant Mole"—a deep pool shut in by a screen of park-like timber. The artist seems to have endeavoured with great earnestness to define the botany of his subject, the leafage and colour of each tree is described, and much of the work seems to have been carefully studied on the spot.

No. 36. 'A Natural Reflection,' J. D. WINGFIELD. The scene is an artist's studio, which we recognise at once as the coffee-room of the old Clipston Street school. There are two figures—a young lady seated and inspecting photographs, which are held before her by an artist—personally more like Charles the Fifth than Francis the First. The plaster properties of the place are classic, dusty, and little used; the mediæval "fixings" are precisely of that kind which tell well in pictures.

No. 37. 'An old Sloop on the Sands of the Dee,' W. LINTON. A large picture painted in the feeling of the gone-by school

of English Art. The disposition of material presents on the left the old wrecked and decaying craft, with an accompaniment of a stern-boat equally ragged. On the right the view opens over the sands, the ridges of which rise to the horizon. We recognise in the work a principle founded upon very honest convictions. In these days of colour and *ad captandum* effect it is refreshing to encounter anything like simplicity. The composition may be resolved into few parts, in conformity with a very limited range of colour; and from what we see of the determination of the painter, he does not care to enlarge it.

No. 42. 'Fruit,' G. LANCE. This is the dessert of a Sybarite, not so much in the rarity of the fruits as in their exquisite arrangement—so chastely assisted by the disposition of these variously-coloured leaves. Beautiful as may be a well-painted heap of fresh fruit, that beauty and freshness derive an additional charm from elegant composition.

No. 43. 'A River Bit, North Wales,' J. DEARLE. A small and simple production, painted, it would seem, in a great measure, on the spot. There is much more of natural colour in this work than in other preceding productions of the artist, although it appears to us that his foliage is more woolly than it used to be. The freshness and telling effect of the picture will sustain it under any comparison.

No. 48. 'A part of the Lake of the Four Cantons, Switzerland,' T. DANBY. The peculiar charm and sweetness of this picture are not the distinctive qualities of Swiss scenery. The filmy atmosphere which partially veils the distance here, is one of the peculiarities of the landscape scenery of our own islands. It is easy to understand that in Art, under one absorbing impression of the beautiful, which is truth, it is difficult to avoid attributing the same charming truism in other instances which affect us agreeably; what is true of Scotland is not also true of Switzerland. Much of the picture seems to have been treated ideally. We have said the worst of it; in some of the main essentials of painting it is beyond all praise.*

No. 55. 'Frances Jennings,' J. INSKIPP. May we call this a historical subject—it is selected from the second volume of Macaulay? Frances Jennings, the sister of the celebrated royal favourite Sarah Jennings, on one occasion dressed herself as a fruit-girl and sold oranges in the streets. The picture presents therefore an orange-girl, whom we at once recognise as only masquerading by the delicacy of the hands and features. The paleness of the face is intended to signify a dissipated course of life, but the artist has left the complexion crude and unfinished. Many a time and oft have we admired the *leger-de-main*—the flowing facility of this artist's brush; but this example is in a style which may be described by one vulgar term of the vulgar tongue—it is so "fast" in execution that much has been forgotten, and the varnish (if it has been varnished) has chilled upon it. A very slight glaze would have subdued the rawness without affecting the paleness.

No. 60. 'The Martyrdom of Ridley and Latimer,' SIR G. HAYTER, M.A.S.L. This

* There are several pictures by this artist in the collection, but none of them have any prices: in other words, they were all sold before they were sent in. It is said that they are all the property of one collector, at Birmingham; and rumour prophesies that at no very distant period they will all make their appearance "in the market," preceded by one or two sales, at which one or two of these pictures will be made to sell for very large sums, which very large sums will become "precedents," and hence buyers will be tempted to "speculate."

subject is one involving the greatest difficulties of historical Art, and demanding for a successful issue the highest qualifications in an artist. The composition is made out according to a passage in 'Fox's Book of Martyrs,' "The scene took place on the 16th of October, 1555, close to the city ditch, outside the north gate and Bocardo in front of Balliol College, Oxford * * * . Lord William of Tame arrived from London with the commission for the execution; he was accompanied by the mayor and sheriffs of Oxford * * * . The sister of Bishop Ridley, and his brother-in-law, the humane keeper of his prison, and his wife with Sir Henry Lea, Sir George Barnes, Sir — Dobs, knight and alderman of London, the officers of the guard, and many friends followed them." The picture is small in comparison with the size of those usually called historical, but had it been of such dimensions, the number of figures must have been curtailed. The form of the arrangement is circular as to the agroupment: an entire enclosure being effected by the city wall and Balliol College. The particular moment represented is that of the meeting of the martyrs at the stake, which is being surrounded by faggots. On the right are seen the authorities reading the commission for the execution, and supported by all the officials whose presence was necessary in discharge of their duties. We cannot help feeling that the principal figures are small and wanting in importance in comparison with those of a group nearer the eye and in the shade; but a close examination of the work shows that it has throughout been very conscientiously painted, the object of the artist having been rather historical accuracy than pictorial effect.

No. 66. 'The Soldier's Return,' G. CRUIK-SHANK. The story is that of a soldier who in returning to his village home, is recognised at a distance by his wife and children. Surely no artist was ever less ambitious than the author of this picture. The tale is pointedly told, and the work is admirable from its entire absence of an affectation of drawing, colour, and execution.

No. 67. 'An Italian girl at her devotions,' H. PICKERSGILL, Jun. The head is an agreeable passage of the study, but the hands are out of all proportion in their exaggerated size.

No. 68. 'An Old Bridge near Pella in Piedmont,' G. E. HERING. The subject has been selected with a taste for a happy disposition of form; the old bridge, especially, in the foreground is a most picturesque object, and the scenery constituting the middle and remote distances is grand. The right is closed by lofty cliffs and rocks crowned by a monastery, the left opens on a lake shut in by lofty mountains, which close the distance. The retiring masses are graduated with the nicest art, until the most remote tell faintly against the horizon.

No. 73. 'Le Vendemmie,' R. BUCKNER. A group of Italian children, supposed to be engaged in the vintage. The head of the principal figure is too pretty for that of a boy; the others are rather national and characteristic; the hands, especially those of the female figures, are too large.

No. 74. 'The Cradle,' D. W. DEANE. The scene is a cottage interior, the window of which occurs in the centre of the picture,—and opposed to the light of this, is the mother who looks down on the cradle. The opposition of the figure to the light of the window produces a powerful effect, that is well supported by the reflections.

No. 78. 'L'Allegro,' ALEX. JOHNSTON.

"Come, thou goddess, fair and free,
In heaven yelep'd Euphrosyne."

A single figure, three-quarter length, in the attitude of dancing. A most charming study, light and transparent in colour, and beyond measure hilarious in expression. Nothing can exceed the grace and sweetness of the head, it is a most brilliant conception; the features, perhaps, are rather pastoral than classic—a more elevated character had been more appropriate to the subject—but nevertheless as it is, it is one of the most exquisite figures we have of late seen.

No. 83. 'Guy's Cliff, Warwick,' E. J. NIEMANN. The subject is constituted of a portion of the castle, and a dense screen of trees extending on the right along the bank of the river; the time is evening, and the whole of the lower part of the scene lies in shaded opposition to the clear evening sky. The sentiment of the treatment is characterised by much refinement and elegance.

No. 91. 'Magnolia,' MISS MUTRIE. A small but brilliant picture of a very inconsiderable subject, to which importance is given by very skilful painting.

No. 93. 'A Moorland Farm, Devon,' J. H. DELL. The drawing and painting of these farm buildings, the edges and surfaces of these bricks and slates, are described in a manner painfully minute; nothing but a photograph could have suggested this scrupulous manipulation, which in many parts is so hard and sharp.

No. 94. 'Passing the Lock—Winter Evening,' G. A. WILLIAMS. A very agreeable version of a simple subject.

No. 97. 'Calf and Sheep,' G. HORLOR. These animals are successfully painted, but the calf is especially so.

No. 99. 'From our Own Correspondent,' W. HEMSLEY. There are two figures in this picture, one a boy reading the *Times* aloud, and an old Greenwich pensioner listening. It is a small work remarkable for finish and expression: and fully sustains the very high reputation of the excellent painter.

No. 100. 'The Sketch Book,' G. WELLS. This is a life-size study—the head and bust of a girl intent upon "the Sketch Book." The drawing is accurate, and the subject is judiciously painted, but it is felt that the head is deficient in importance.

No. 107. 'Tithe Farm,' J. STARK. From the title we might expect here an agricultural theme, or at least an essay, more or less pastoral; but like the best works of the painter, it is a study of a passage of sylvan nature, rendered with infinite simplicity, freshness, and vigour; and remarkable for a feature extremely difficult in tree painting, the definition of the groups and individual trees respectively.

No. 109. 'The Brother's Lesson,' G. SMITH. A music lesson—the instrument being a very primitive pipe, and the master and pupil two youthful rustic figures, with much refinement and execution. The musicians are unexceptionable, but the background does not look natural.

No. 110. 'Portal of the Cathedral at Chartres,' L. J. WOON. We do not frequently find these subjects interesting in oil painting, but in the small pictures of this artist they are brought forward with a taste and judicious execution that give them an unusual importance.

No. 122. 'Clovelly, North Devon,' J. WEBB. This is an attractive subject, but like every other similarly interesting, it is too frequently painted. We know every stone of the old tower-like jetty; we recognise in each house an ancient and familiar habitation: artists do themselves an unwarrantable injustice in compelling comparisons which perhaps spectators would

willingly avoid. The want of novelty in subject is, however, in this case perhaps compensated by the merits of the work: they are certainly of a high order: the picture challenges comparison with the best productions of its class.

No. 127. 'A Rainy Day on the Lagune of Venice, a Sketch on the spot,' E. W. COOKE, A. R. A. Under every phase, hot and cold, wet and dry, have these buildings been served up; and there is, perhaps, nothing impresses the mind of an observer so sensibly with the bewildering variety of appearance that excellence in art may assume, as to see a hundred different versions of the same subject, all more or less distinguished by valuable quality. The aspect of the scene is according to the description of the title. We have long been weary of speaking of the weather-worn bricks of Venice; we turn therefore with some relief to the sky, of which nothing otherwise than respectful can be said.

No. 132. 'Sunset in the Highlands,' A. GILBERT. The simple and always striking effect of the opposition of breadths—here there are the sky and the shaded landscape—the latter a wild, mountainous, and rocky tract. With a sprinkling of the antlered denizens of these wildernesses, the principal parts being managed in this facile method a very agreeable picture is produced.

No. 140. 'Near Buccione, on the Lago d'Orta, looking towards Monte Rosa,' HARRY JOHNSON. The manner and feeling of this work are materially different from those of anterior productions. The picture is larger than any we remember to have seen under this name, and we are impressed with its substantive interpretation of nature rather than by flashes from an enchanted brush. We are placed opposite to a block of Italian buildings, with all the variety of parts useful only to be painted; and thence the eye is invited to ascend and scan the mountain sides and crests which sweep round the basin of the lake. The whole is most substantial and earnest, and a most successful and striking passage of the picture is the description of the rapidity of the current as it flows by us; and it is to be observed as a local truth, that the distances do not wear the atmospheric veil which envelopes remote objects in our own land.

No. 148. 'Choir of the Church of Santa Maria Novella, Florence,' LOUIS HAGHE. The subject and the painter are worthy of each other. This is a part of the famous church occupying one side of the Square of Santa Maria Novella, and which the lips of Michael Angelo were never weary of praising. Here are works of Cimabue, of Ghirlandaio, once the master of Michael Angelo, of Bronzino and Allori, Orgagna, and early productions of Giotto. But with these we have now nothing to do; turn we therefore to this famous choir as we see it before us—the centre of which is occupied by a large lectern, somewhat exaggerated here, we think, as to size. Having been for many years accustomed to see the most admirable sacred and secular interiors painted in water colour by this artist, we cannot help comparing him with himself. Haghe's most formidable competitor is Haghe. These water-colour works have every charm of light and colour, and perfect illusions of depth and transparency; but in this picture the shaded passages are opaque. If the artist understands glazing in oil colour, he does not practise it successfully. But we forgot to mention that this is his first essay in oil painting, at least that we have seen. The shades are heavy and dull, and there is a thinness and sharpness in the execution that reminds us of water-colour;

but there is, withal, a unique equality in the picture which would distinguish it amongst works of the highest pretension. The interior derives animation from groups and single figures of the Dominican brotherhood, some in movement and others at devotional exercise. In a word it is a production of considerable power.

No. 158. 'Timber clearing on the hill-side, Sussex,' H. JUTSUM. Rather a large picture, and full of the most conscientious elaboration. On the left rises a screen of noble trees, with an accompaniment of the graceful garniture of dwarf and gigantic grasses and wild flowers, which constitute the wealth of a weedy foreground. From the immediate section the eye is invited to the near and remoter gradations, and whether this work represents or not a veritable locality, we feel proud of our land in contemplating such passages of Art, because we know, to use a very common proverb, *se non e vero e ben trovato*. The sky teeming with clouds, and the hazy atmosphere are our own. The description of distance and expanse is most successful, and this is much assisted by the sunlight, here and there escaping the envious clouds, and dropping on the summer foliage of the magnificent trees, which extend even to the mysterious veil that hides the horizon from the eye.

No. 161. 'An English Landscape,' J. DEARLE. A subject as simple as could well be selected; but an eloquent evidence, if any further were wanted, that the greatest charm in Art is fidelity to Nature. The subject is composed of a corn-field recently reaped, all the sheaves being stacked—on the right a road, a few straggling trees, and a distance. We like this picture better than any of the river-side subjects we have seen by the same hand, as the colour which should be natural, is so, and not chalky.

No. 162. '***' H. W. PICKERSGILL, R.A.
"The young village maid, when with flowers she dresses
Her dark flowing hair for some festal day,
Will think of thy fate till, neglecting her tresses,
She mournfully turns from the mirror away."

These lines from Moore's "Fire Worshipers" stand in the place of a title to one of those life-sized studies illustrative of Oriental female character, of which this artist has painted so many, and many of much excellence. There are beautiful parts in the work; and if not so agreeable as a whole as others he has even recently exhibited, the work sustains the high reputation of the accomplished painter.

No. 169. 'Stray Sheep,' R. ANSDALL. It is difficult in this composition to say whether the animals before us have strayed from another flock, or are errant members of the flock confided to the herd who is approaching. This may be immaterial, as to the general merits of the picture; but if any narrative be intended in the spirit of the title, the description appears imperfect; but we cannot help admiring the character of the animals, which it appears are taken in a rocky nook. They are alarmed, and, although they are standing still, it is sufficiently clear that they are rapid in movement and even headlong in flight, almost as wild as *ferre nature*.

No. 172. 'View near Rothsay on the Clyde, Scotland,' J. DANBY. According to the principle of this artist, the parts of this picture are few—water and mountains. His composition is frequently identical—water shut in by mountains; and his effect is generally the same, that derived from the evening sun. The effect is warm and glowing; but the water is deficient of the same breadth which prevails in the upper parts of the picture.

No. 176. 'Sunset,' W. A. KNELL. This is evidently the work of one who has looked very closely at Nature—we know this to be true;—but were it not so, the work would strike the spectator in the same way. The colour of the sea tells us we are in some large estuary. The sunset is pointedly described; there is wind in the sky, and movement in the water; but we feel the latter to be spotted with lights which, although they in some degree support the proposition of the title, yet destroy the breadth of the lower part of the picture.

No. 177. 'Roman Piper,' R. BUCKNER. A life-sized study of a rustic of the Campagna. The head is looking up with an expression full of thought and intelligence. It is one of the best of this painter's works; and may rank among the best in the collection.

MIDDLE ROOM.

No. 184. 'A Scene suggested by the Death of Pompey,' T. DANBY. Here, then, we are on the shore of the Bay of Alexandria, unseen witnesses of the absorbing grief of the freed-man Philip as he laments the fate of Pompey, near whose body he sits. We see very distinctly the weeping Philip, but his dead master is very indistinctly shown, and this is more judicious than to show a revolting object. The effect of the picture is somewhat like that of moonlight, and the whole has a very misty appearance, which is not generally true with respect to Egypt, for there the atmosphere is so clear that even distant objects come forward with much decision and sharpness. But whatever objections may be made to the work, it is one of the best of the landscape (?) *quasi* historical pictures we have of late seen: the drawing is good and firm, and the proposed effect successfully worked out. A heron is flying away across the sea, and a lizard has just come forth from its hiding-place; the presence of the one indicates tranquillity, but the departure of the other betokens disturbance; but we submit that neither should appear in such a picture. The heron is not a sea-fowl, and although the lizard may be found near the sea, it is no amateur of salt water. The body by the way should be headless; it is not so.

No. 204. 'Winter, Evening—a Black Frost,' C. BRANWHITE. It may be very cold within the freezing region of this canvass, but the spectator is not so rapidly iced as in contemplating one of the combined frost and snow pieces of this painter. The effective point of the picture is the sky, which is intensely red, broken by dark streaky clouds, which are too material and opaque. The composition is successful, as are all those of the painter, though looking as if gathered piecemeal from Nature and skilfully fitted together. The principal object is on the left, an old lime-kiln, or what you will, by a river's side, and moored near this is a barge being loaded. The river with rows of trees on its banks runs into the composition, an arrangement which is managed with a result perfectly successful.

No. 205. 'The Egyptian Ivory Merchants,' FRANK DILLON. This is, in all respects, a remarkable work, novel and interesting in subject, and, though elaborately wrought, exhibiting much freedom of touch and masterly skill in treatment. It is, perhaps, too abundant of materials, yet all the accessories are evidently painted from nature, and some of them are so highly finished as to vie with the best examples of still life. The artist has obviously travelled for study: his knowledge is not derived from books, but from personal acquaintance with the

character and objects he depicts. Hence the true value of this painting, which combines ability with observation, and thought with industry.

No. 206. 'A Water Nymph,' J. COLBY. A small, all but nude figure, relieved by a white drapery thrown behind. A well-drawn and graceful study.

No. 210. 'Minding the Cradle,' G. SMITH. This is altogether the most perfectly finished little work that the artist has yet exhibited. The subject is of the simplest kind, but in drawing, colour, and transparent depth it is a charming production.

No. 212. 'Cupid teasing a Butterfly, Emblem of the Soul,' J. G. NAISH. A conception worthy of the best of the Greek poets. Cupid is flying, and threatening a butterfly with his arrow. The dark colour of the butterfly is a spot in the picture, the insect had been better white for more reasons than one; besides it is that member of our common entomology called "the devil's butterfly." The little figure is charming in colour.

No. 218. 'Northland, Sussex,' J. STARK. A section of wooded scenery, with a road passing through it. Each tree is so well painted as to be individually defined without in any wise destroying the breadth of the whole. These latter works are infinitely better than all that have for years past gone before them.

No. 219. 'The Warrener's Boy,' W. HEMSLEY. A single figure carrying a rabbit—a miniature brought forward with the most scrupulous care.

No. 222. 'Fishing Craft, &c. in a Calm,' W. A. KNELL. As to finish, colour, the character of his craft, and other qualities, this artist desires to break a lance with some of the best of the Dutch painters; but his water is not liquid, and his surface generally harsh.

No. 225. 'Cut Melon and other Fruits,' W. DUFFIELD. The fruits individually are well painted, but the arrangement is deficient of grace.

No. 230. 'The Monte Rosa, Early Morning,' G. E. HERING. The time is sunrise, but nothing is yet lighted save the snowy peaks of the distant mountain—all else is in the gloom and the grey of the morning. A market-boat is on the lake near us; we hear the plash of the oars, but all beyond are silence and tranquillity, presided over by the young crescent of the moon, and one solitary and forsaken star. The sweetness of this poetic effusion is far before everything which the artist has hitherto achieved in pictorial verse.

No. 231. 'Nymph and Cupid,' W. E. FROST, A. R. A. One of those miniatures which this artist endows with such classic feeling. The Nymph may have been wounded by one of those envenomed arrows; she has therefore seized the bow, and refuses, with bitter reproaches, to return it. The incident is common, but it has seldom been more beautifully rendered than we see it here.

No. 245. 'Danish Fishing Craft on the Elbe at Blankanese,' E. W. COOKE, A. R. A. The boats, as usual, are very conscientiously made out, but every thing about them is as hard as Pharaoh's heart, and nothing is natural in colour—hence the commendable qualities are obtained at a great sacrifice.

No. 246. 'Little Gretchen,' H. LE JEUNE. A study of the head of a little girl sitting with a book on her knee. The face is Dutch, and the feeling of the picture is entirely Rembrandtesque. There is no straining after poetic beauty, it is a purely natural essay; the flesh is soft, warm, and yielding, and the expression life-like and intelligent. It is such a study as Rembrandt might have

made in his youth, for he did work then very minutely, as instance that marvellous example in the second or third room of the Pitti Palace.

No. 250. 'Cruising amongst the Water Lilies,' a Sketch, F. M. MILLER. A Cupid in a shell skiff, sailing in a flowery pool. A pretty conception, agreeably realised; we remember some sculptural productions of this artist of much classic chastity of feeling.

No. 252. 'Rabbit Ferreting,' HARRY HALL. The figures in this work have been very earnestly studied, but it is a mistake to relieve them by a pale background, leaving them as it were cut out of the composition.

No. 260. 'The Raft,' T. M. JOY and J. WEBB.

"O source of life, our refuge and our stay,
Whose voice the warring elements obey,
On thy supreme assistance we rely,
Thy mercy supplicate if doomed to die.
Perhaps this storm is sent with healing breath,
From neighbouring shores to scourge disease and death," &c.

The subject is from Falconer's Shipwreck, but from the time of the first exhibition of the dying survivors of the Medusa, every marine painter has produced at least one "raft." The scene is always distressing—the circumstances, with little variation, are identical—but certainly this is one of the best versions we have seen of the subject. It is sunset, and if we read the story aright there is hope, the distant ship bears up. For Mr. Joy this is an entirely new department of Art; the work is perfectly successful in exciting the emotions which it is intended to reach: is painted with much care; and is indeed a production which closely approximates to, if it does not absolutely reach, the higher qualities of genius.

No. 261. 'The Eagle's Craig,' J. DEARLE. In all the works of this artist we feel first the positive opposition of the sky and the lower section of the composition. The "Eagle's Craig" is a cliff on the other side of a stream which bisects the scene horizontally. The base of the cliff is lost amid the trees which grow on the hill side; the trunks of the trees are definite and sharp, but the masses of foliage are woolly and confused, conditions which cannot coincide in Nature; if the trunks are truly represented, the masses of foliage are wrong; if these are right, the representation of the boles of the trees is false.

No. 262. 'Il Penseroso,' ALEX. JOHNSTON. What Milton could mean by re-baptising, by these sidelong masculine Italian epithets, his nymphs Joy and Melancholy, does not very clearly appear. The marriage of masculine and feminine is natural enough in every way, save in outrage of the second grammatical concord. The position in which Milton has left these ladies before the world is at least equivocal. The figure so entitled is a worthy pendant to "L'Allegro," already noticed.

No. 266. 'Beauvais,' A. MONTAGUE. These dear, dirty, picturesque old houses of Normandy and Brittany help a picture so much! But we think the wooden-framed palaces of Beauvais are scarcely so ragged as we see them here.

No. 273. 'The Morning Lesson,' W. H. KNIGHT. Consisting of two figures—the grandmother mending stockings while the grandchild stands by occupied with the "lesson"—a small picture leaving nothing to be desired.

No. 274. 'A Shepherd Boy,' J. INSKIP. In our experience of the last fifty years we have never known an artist so ambitiously true to himself as this painter. Whether he recruit himself from Aristides or the

Vicar of Bray matters little. We have for the last twenty years had a nodding acquaintance with the young gentleman in the smock-frock. We wish he were a little more carefully adjusted. We should be sorry to leave him worse than we found him.

No. 275. 'Glanmorfa, Carnarvonshire,' J. W. OAKES. A landscape of much merit, closely imitated from nature.

No. 276. 'The Hypæthral Temple, Philoe, Nubia,' FRANK DILLON. A very famous and beautiful remnant of Egyptian architecture. It is a large and earnestly wrought picture, presenting the temple in the best point of view we have ever seen it. This and the work already noticed (No. 205) will very considerably raise the reputation of the artist: there are indeed few living painters who could have treated this subject better: broad in style, yet industriously wrought as well as carefully considered, there are not many better pictures among the productions of the past year.

No. 277. 'The Emperor Charles the Fifth at the Monastery of Yuste, August 31, 1558,' W. MAW EGLEY. We have seen and written of this, or a smaller sketch for the picture, before.

No. 286. 'Maryport, Cumberland,' W. LINTON. Presenting a view of a portion of the harbour at low water. The effect introduced is that of uncompromising daylight unassisted by any accidental shades, in which proposition the artist has succeeded admirably.

No. 290. 'Jephtha's Daughter,' E. HUGHES. A charming miniature, but the title is a misnomer,—there is no attempt to idealise the character proposed.

No. 306. 'Midsummer Fairies,' J. G. NAISH. The time is midnight, and the elves are sporting among the leaves of flowers,—a geranium being their favourite resort. The flowers and minute figures admit of the closest examination.

No. 310. 'The Alhambra, Granada,' as seen from San Christoval, from a Sketch by Richard Ford, Esq., W. TELBIN. We have not seen in any work of Art so much of the magnificent scenery around Granada as is represented in this picture, all the details of which are most scrupulously rendered. The grand line of the Sierra Nevada closes the view.

No. 326. 'British Bulwarks,' H. DAWSON. A large picture, which takes us to Spithead, or the Medway it may be. The effect is that of sunset painted with all the power which this artist exercises in his morning and evening essays; the evening gun is just booming from one of the lower ports of a three-decker—the principal object in the picture—which by a little *ruse* of perspective is brought forward as of immense proportions. Turner has done this before. It is a production of distinguished merit.

No. 338. 'Dunstaffnage Castle, Loch Etive, Scotland,' J. MOGFORD. A glowing sunny version of a most interesting passage of scenery.

No. 339. 'The Ptarmigan's Haunt,' J. WOLF. A large picture of a section of wild Highland scenery. The birds are admirably drawn, but the rocks are so much like them in colour as very materially to injure the effect of the composition.

No. 340. 'Morning on the Welsh Hills,' A. W. WILLIAMS. In this work, the subject of which is a passage of wild mountain scenery, there are some cattle, apparently well drawn. It is essentially different in feeling from the usual works of this painter—broad and substantial, and yet very minutely detailed.

No. 352. 'Rosalind,' H. O'NEIL.

"From the East to Western Ind,
No jewel is like Rosalind.
Her worth being mounted on the wind,
Through all the world bears Rosalind."

This study, that of a single figure (perhaps too dramatic), is brought forward with all the tenacious elaboration which distinguishes the works of the artist. The lower limbs are out of drawing; the length of the thigh looks altogether disproportionate.

SOUTH ROOM.

No. 358. 'Interior, Ditton House,' C. H. STANLEY. Rather a large picture, presenting a spacious apartment, sumptuously furnished, and enriched with objects of Art. It is rich in colour and well lighted.

No. 361. 'Imogen and Iachimo,' W. GALE. The passage of "Cymbeline" supplying the subject is found in the seventh scene of the first act—

*Imo. Away! I do condemn mine ears that have
So long attended thee. If thou wert honourable,
Then wouldst thou have told this tale for virtue, not
For such an end thou seek'st, as base as strange."*

The action of the two figures in this picture is unnecessarily exaggerated; there is a violence in the movement of both altogether inconsistent with dignity of expression. The work does not possess the merit of antecedent productions.

No. 386. 'The Guards relieving the Trenches before Sebastopol, from a sketch taken on the spot,' Hon. C. S. HARDINGE, M.P. We see here the long line of troops winding down into a ravine formed by lofty and towering cliffs. The city and line of attack appear in the distance. The picture presents, we presume, a faithful description of the locale, and possesses much interest, not only with reference to the subject, but as a work of Art.

No. 394. 'Enamel of the Infant Saviour,' W. ESSEX. After Murillo, we think; charmingly wrought, and undoubtedly like the picture.

Nos. 396 and 397 are two enamel groups of 'Flowers,' by Miss H. ESSEX. The bouquets are relieved by a dark background, and each flower is painted with the utmost delicacy of touch.

No. 398. 'Evening,' E. J. COBBETT. A small study of a country girl at a well, brought forward with all the best qualities of miniature Art.

No. 432. 'Dunolly Castle, near Oban, Scotland,' J. DANBY. This is a repetition of the same phase which this artist always paints: an expanse of water and mountains, presented under a sunny evening effect.

No. 433. 'Feeding-Time,' C. HANCOCK. A number of farm-yard animals are here agrouped in a stable; the principal of these is a cow, which is well painted.

No. 436. 'Cupid and Psyche,' CLEMENT BURLISON. In these two figures there is good colour; but in each the classic character is wanting. There is too much of the individuality of the model; the composition also is too much broken up into detail.

No. 445. 'Rouen,' J. HOLLAND. The view is taken from below the line of the quays, and on the opposite bank of the Seine, showing the imposing façade which has comparatively recently taken the place of the wooden-framed houses that still numerously exist in other quarters of the town. The subject is at once recognisable by the spires of St. Onen and the Cathedral, which rise above the houses. The proposed effect is that of bright day-light, which is admirably sustained.

No. 449. 'The Guard-room,' R. CLOTHIER. A small interior, in which is a solitary cavalier of the seventeenth century, with a quantity of armour of the same period, all very accurately described.

No. 458. 'A Fairy Ring,' G. CRUIKSHANK. The subject is suggested by the popular supposition that the moonlight fairies have danced in those small circles which are common in all pasturages. But here we are amid a jovial company of midnight elves, dancing round Oberon and Titania enthroned on a toadstool. The tumultuous tread of this frantic gallop reaches our ears; and music! was there ever such a troop of earnest musicians,—at least a thousand minute spiritualities labouring on all kinds of instruments. Some of the company are late; they arrive on bats from the moon and stars. We have not really space to do justice in description to these revels; the artist must have assisted at these festivities. He may himself have been born again under Aquarius, but some of his little impalpable friends here have, most shamefully broken the pledge.

No. 472. 'Amiens,' A. MONTAGUE. A very picturesque subject, at once recognisable by the striking features of the composition.

No. 488. 'A Welsh Spring,' E. J. COBBETT. Two Welsh girls gossiping at a spring, while the thin and tardy thread of water fills their cans. The heads are painted with all the artist's usual sweetness, and the rest of the picture is worked up to equal value, especially the herbage and the local portions of the composition.

No. 502. 'Fresh Breeze, Dublin Bay, from East Pier of Kingstown Harbour,' E. HAYES, A.R.H.A. The breeze is rendered with great spirit, and the whole of the points of the composition are well brought together.

No. 503. 'Noontide on the Thames, near Henley,' W. J. FERGUSON. A subject extremely difficult to paint, but treated in this picture in a manner very gratifying to the eye from the natural truth prevalent throughout the picture.

No. 520. 'Squally Weather off Dover,' J. J. WILSON. The subject of this work has often been painted. It is the view from near the entrance to the harbour, looking towards the Castle. The character and principal features of the scene are so striking, that it is at once determinable as a view of Dover.

No. 537. 'Finding the Lessons,' J. COLLINSON. We have more than once commended the extreme earnestness of this artist. This work is throughout not less conscientiously executed than those productions which have earned for him his well-merited reputation.

535. 'An Autumnal Day, a scene on the Bovey Heath Fields, with Dartmoor Hills in the distance,' W. WILLIAMS. We feel the foliage here rather more crisp than in nature, but other passages of the work are very creditably executed.

The sculpture of the exhibition, as we have already observed, is limited as to the number of works; of those that strike us there are, a 'Marble Statue of a Young Girl,' T. THORNYCROFT; 'Undine,' a marble statue, ALEX. MUNRO; 'Model of a group executed in stone and now fixed upon the portico of the New School House for Female Orphans,' E. G. PHYSICK; 'Zephyr and Aurora,' T. EARLE; 'The Queen of the Waters,' J. GEEFS; 'We frolic while 'tis May,' FELIX M. MILLER; 'The Good Shepherd,' P. VANLINDEN; 'Venus and Cupid,' S. A. MALEMPRE, Sc. We have looked carefully through the collection and find every department of Art represented; but we find a lamentable deficiency of impressive subjects, a want that must rest with the artists themselves, many of whom, in the enjoyment of reputation, are by no means equal to themselves as we have known them.

THE
CARVINGS OF GRINLING GIBBONS.

In calling the attention of our readers last month

Mr. Rogers having been professionally employed to direct the preservation of the carvings by Gibbons, at Belton House, has very properly stated the result of his investigations and experience before the Royal Institute of British

to the preservation of carvings by Grinling Gibbons at Belton House, Lincolnshire, under the direction of Mr. W. G. Rogers, we mentioned that in all cases photographic views of these high works of decorative Art were first taken to serve as a memorial of them in their original state, and as a guide to their re-position. Of these photographic representations we have selected one for engraving from the gallery of the chapel at Belton House, but which evidently was designed for the decoration of a dining-room. It is one of the perplexing disarrangements frequently to be met with in old houses, that time has produced innovations so inconsistently, that sacred subjects have been removed to private rooms, and emblems of festivity transferred to the walls of an ecclesiastical edifice. In the composition before us, the intention of the artist is carried out with the most scrupulous attention to propriety, everything being avoided which does not strictly belong to the subject. The upper part is composed of two cornucopias, the horns tied at the top with bunches of flowers crossed with palm branches, and bound together with wreaths of buttercups which unite the top to the sides.

The sides hang from ribbon ties, and consist of a profusion of finely formed fruit, corn, hops, and wild flowers; some of the most disregarded of the latter class being turned to the best account and introduced with the happiest effect. The poppies and poppy-seeds with the elegant foliage of this class of plants are sculptured with the nicest appreciation of arrangement, while flowers of lesser note are pressed into the service in a way unappreciable by those who, studying in the drawing-room, rather than in the meadows, content themselves with conventionalities instead of nature, and attach a vulgarity of their own to all except roses and lilies.

Grinling Gibbons, as a great artist studied nature deeply and unceasingly, but whenever her works claimed the labour of his chisel, they were not slavishly or unmeaningly copied irrespectively of use or position, but were employed rather as the materials for composition than as composition itself. They were introduced and grouped with the most devoted attention to the architectural effect of the buildings destined to receive at his hands their choicest embellishments, and the appropriate nature of his classifications must long furnish a theme for the admiration of students. He broke through the rules of conventionality in a manner almost unprecedented, and it is probably on these grounds that he has received the meed of so much popular, although richly deserved approbation; but we are not aware that any attempt has ever been made (only possible by the assistance of photography), to form a critical examination of the works of this great master, and to compare his rich and varied compositions with those of other schools, and especially with those represented by Giovanni da Udine and Raffaele.

It cannot be doubted that all possible opportunities should be seized upon for the preservation of the works of a man who has given to the Art of wood-carving in this country a fame more than European, and who as an artist especially appointed by the state, and working under its immediate patronage, left behind him for the admiration and guidance of succeeding generations, works in royal and palatial edifices, which are pointed out as proud specimens of British decorative Art, although they exhibit the bloom of a fallacious youth, and are positively falling into irreparable decay.

Architects, and has accompanied his remarks with a startling revelation as to the state of nearly all the carvings of the period of Charles II., James II., and Queen Anne in this country. These magnificent remains are so rapidly perishing, that if immediate means be not taken for their preservation they must soon cease to exist. From one end of the kingdom to the other an insidious disease is preying upon the vitals of the noblest works of sculpture in wood this land ever produced. The fabled fruit of the Dead Sea was not more fragile or more filled with putrid dust than the fruit, the work of the chisel of Gibbons, which hangs on the walls of Burleigh, Petworth, Chatsworth, Wollaston, Belton, Oxford, Cambridge, Windsor Castle, Hampton Court, Gosford House, Lowther Castle, Witley Court, and other public and corporate buildings, but also on the very many choice objects of his art in private collections, such as portraits of royal and noble persons, set in panncels surrounded by a glorious profusion of emblematical decorations, thrown about them with a freedom and daring truly marvellous, and with a delicacy equalling the famous point-lace tie from Strawberry Hill, now in the possession of Miss Burdett Coutts, or the string of family portraits dispersed among the carved flowers in Lord Ilchester's borders. Mr. Rogers has, no doubt, ascertained, from his long familiarity with these works, that many historical records are preserved in them, and if they could be brought together, they would fill a gallery, and form an exhibition of great interest.

In many of our city churches there are the seeds of the same approaching decomposition. The white superficial bloom (so agreeable to the eye of the uninitiated), which appears in nearly all the specimens Mr. Rogers has seen and handled is assisting to complete the work of destruction. This mildew, covering the surface of the fruit flowers, and dead game, is a vegetable thrown off from the decaying interior, and must ultimately, if left to accumulate, destroy the skin or rind which holds together the outward form only, the interior being nothing but skeleton fibre powdered with dust and unable to resist the slightest pressure.

Specimens of carvings by Gibbons taken from various sources were recently exhibited at the Royal Institution; some presenting the deceptive bloom alluded to, some in which it had been removed by the touch, and some in which Mr. Rogers had sawn the fruit in two so as to show the interior honeycombed by worm, suggesting to the observer that the carvings have been so far neglected as to reach the extreme period at which preservation is possible.

Surely it is high time that works of Art of such national importance as those which we have named as existing in the various palaces and mansions of this country, should receive the small amount of skilful attention indispensable for keeping them from actual annihilation. To preserve is not necessarily to restore. Restoration is sometimes worse than neglect; but we maintain that wherever a festoon or frieze or drop or truss by Gibbons exists, it demands, as public heir-loom, that chemical science and practical experience should be exerted and employed upon it to arrest the progress of the animal and vegetable foes, whose devastations have been so opportunely pointed out by Mr. Rogers.

We trust the means resorted to for restoration will be employed without delay to rescue these fine works from destruction.

THE ILLUSTRATED
HANDBOOK OF ARCHITECTURE.*

FEW things have been so industriously cultivated among us of late years as architecture—both the study of its ancient monuments as a branch of archaeology, and the pursuit of it as a fine art: and it is well worthy of the pains which have been bestowed upon it. Its ancient monuments, bearing as they do the impress of the national traditions, and of the actual civilisation of the peoples who built them, are among the most important evidences of history; less durable only than written literature, and inferior only to it in value. As an art, architecture is the most popular of the fine arts; for its *chef-d'œuvres* are not secluded in galleries and locked up in cabinets, but are set before the eyes of all men in the streets and public places of the great centres of population. And though the popular favour for it may have been a little disproportioned to the popular cultivation of other elements of history, or other branches of art, yet this is not at all to be regretted; for the circumstances of the times made it desirable that the thoughts of all sorts of people should for a time be concentrated upon this one subject. We are in the throes of the birth of a new architecture; and we needed that antiquaries should hunt out and arrange all the old schools of the art; that practical people should consider what additional conveniences and comforts they require; engineers should tell how to apply all the contrivances of modern science; architects should take orders from the practical people, apply engineering science, with minds imbued with the principles of their art, gained by a study of its ancient monuments; and that the whole educated people should look on and criticise.

Both for the historian, the artist, and the *dilettanti* patrons and critics, it was in the first place important to have a correct general knowledge of all preceding schools of architecture. Much has been done to furnish them with the materials;—for the last twenty or thirty years a continuous series of grand architectural works have issued from the press, from elephant folio in size downwards, full of the finest illustrations which pictorial art, from line-engraving to chromo-lithography, can furnish; so that now there is hardly a school of architecture, ancient or modern, upon which we do not possess some important works. But alas! the cost of such a collection of books as this amounts to a sum such as not many artists can afford—such as few amateurs can afford to spend upon the study of only one subject. And then the careful study of all these monographs—the digesting from them of a clear comprehension of the history, and principles, and characteristics of each school of the art—and the connecting of this knowledge of all the different schools into one comprehensive view of the whole subject; this demanded an expenditure of time and labour which very few men, artists or amateurs, would or could devote to it.

It was necessary to premise these observations in order to give a fair idea of the importance and value of such a Handbook of Architecture as this, for which we are indebted to Mr. Fergusson.

The plan of Mr. Fergusson's work embraces the great styles of architecture of the whole world;—the Buddhist and Hindoo; the Egyptian, Assyrian, Persian, Greek, and Roman; the Saracenic of Syria, Egypt, Persia, India, Spain, and Turkey; the Romanesque, and the styles which sprang from it in Lombardy, and on the banks of the Rhine, in France, Belgium, Germany, Italy, Spain, Great Britain, and Scandinavia; the Byzantine of the East and of Russia; and the styles of China and Central and South America.

One might perhaps anticipate that in so wide a range, some parts at least would be executed

superficially, or would be mere compilation; but this is not the case: every separate article bears internal evidence that extensive research

has been made into all the available data, and that the material so collected has been carefully and thoroughly studied: the author has made

GHOOSLA GHAT, BENARES. (FROM PRINSEP'S VIEWS.)

himself master of each style before he has begun to write upon it. And the book is not a mere analysis of ancient buildings—it is really what

it professes to be—a History of Architecture: it gives such historical notes and sketches as enable the reader to connect the buildings

VIEW OF PORCH AT CHILLUMURUM. (FROM DRAWINGS BY THE AUTHOR.)

with the history of the people whose monuments they are; and we have throughout the book valuable comparisons and criticisms of the

various styles of the Art, and of the different great buildings which are most instructive as examples of the true principles of the Art. The

* THE ILLUSTRATED HANDBOOK OF ARCHITECTURE; BEING A CONCISE AND POPULAR ACCOUNT OF THE DIFFERENT STYLES OF ARCHITECTURE PREVAILING IN ALL AGES AND COUNTRIES. By JAMES FERGUSSON, M.R.I.B.A., &c. Two vols. 8vo, pp. 1004, woodcuts 550. London: JOHN MURRAY, Albemarle Street.

work is illustrated with no less than 850 very excellent wood-cuts of plans, sections, elevations, and perspective views of the most important and most typical buildings of every style of architecture.

On the whole, then, this is a valuable addition to our historical and fine-art literature;—valuable to the general reader, who will find that the masterly sketch of the whole subject which is here placed in his hands, will make other architectural works unnecessary, except for the thorough prosecution of some especial branch of the subject; and no one, we feel sure, will more readily recognise its value than the professional reader; unless he have a first-rate architectural library, and have bestowed years of diligent and judicious study upon it, he will find very much in this little work which is new and important to him: every architect will find it a valuable hand-book and guide to his more extensive studies; and after all his study, will still find it a useful compendium, and index, and book of reference. In these days of superficial books, we were not prepared to find so much learning, and thought, and judicious labour, within the small compass of two octavo volumes.

We are enabled by Mr. Murray's courtesy to present our readers with several examples of the illustrations of the work, which we have selected so as to give some idea to the eye of the wide field which the work embraces. But in endeavouring to give some further notion of the value of Mr. Fergusson's history, we shall confine ourselves principally to a digest of some of his suggestions upon our own English Art.

In the first place we may notice that Mr. Fergusson finds fault with the received nomenclature of the subject, and suggests some modifications. Some of the terms which are commonly used involve the assumption of incorrect theories, and thus unnecessarily introduce error and confusion at the outset into the mind of the student and of the general reader, who naturally assume that the theories implied in the very terminology of the science are the received and correct theories of the science. It has become the fashion, for instance, to apply the term "Byzantine" to styles as unlike anything Byzantium ever saw as any style can be to another, and where it is impossible to trace any influence direct or indirect that capital ever had on the buildings in question. "Romanesque" in like manner is applied to styles as essentially barbarian as the most pointed and most florid Gothic. It has been attempted to apply the name "Lombard" to all the round arched styles of Europe, and German and Teutonic to all the pointed styles, all involving the assumption of theories, which, so far from being granted, are generally without the least foundation in fact. The term "Gothic" which is usually applied to the pointed styles only, Mr. Fergusson proposes to extend also to the earlier styles which were engrafted on the Roman by the barbarians who overthrew the Roman Empire and founded upon its ruins the kingdoms of modern Europe. This he would subdivide into round-arched and pointed-arched Gothic. If it were desirable to introduce a new term in the place of Gothic, Mr. Fergusson would adopt that of Feudal as the most characteristic, since the style of which we are speaking arose, culminated, and fell with the Feudal system.

For the subdivisions of English Gothic he would abjure technical and descriptive terms, and use dynastic terms only, such as Saxon, Norman, Plantagenet, Edwardian, Lancastrian, Tudor, Elizabethan, Jacobean, and Stuart. From his resumé of the history of English architecture we cull the following notes.

Of the Saxon architecture hardly enough is left to teach us the characteristics of the style; it was probably a rude style of Art; but a considerable interest attaches to it, because probably it is to its influence that we must attribute some of the peculiarities which distinguish all the English styles of Gothic from the contemporary Continental styles.

The Normans brought over their own artists and introduced their own style of building: their early buildings in England consequently exactly resemble the contemporary works of the Continent. But as the Saxon and Norman races

gradually coalesced into the English, so the Norman art was gradually influenced by the old

PORTAL OF THE DUCAL PALACE AT NANCY. (FROM DU SOMMERARD.)

Saxon; until by the beginning of the twelfth century the English style of architecture had

ROOD-SCREEN FROM THE MADELAINE AT TROYES. (FROM ARNAUD, "VOYAGE DANS L'AUBE.")

become very different from the contemporary Continental style; we may call it Norman

Saxonised, or Saxon Normanised, but certainly it is not Norman. Indeed the buildings of the latter half

TOWER AT ILESCAS. (FROM VILLA AMIL.)

of the twelfth century show that the English were making considerable progress in the elaboration of a perfect round-arched Gothic style; but at the end of this period they fell under the spell of the new French art, which had then for some time been using the pointed arch, and had already brought to some perfection the new style to which that new constructive feature gave rise. For Mr. Fergusson lays it down as beyond question that we did not evolve a pointed style contemporarily with the French; but that the style arose first in France, and after some thirty to fifty years was adopted in England, and not till half a century later still by the Germans, and was never adopted by the Italians.

The thirteenth century was the great building era; not even the Pharaonic era in Egypt, the age of Pericles in Greece, nor the great period of the Roman Empire will bear comparison with the thirteenth century in Europe, whether we look to the extent of the buildings executed, their wonderful variety and constructive elegance, the daring imagination which conceived them, or to the power of poetry and of lofty religious feeling that is expressed in every feature and in every part of them. Mr. Fergusson goes into interesting critical descriptions of some of the great works in this and the other Gothic styles, which we recommend to the attention of our readers, but into which want of space will not allow us to follow him.

The geometric tracery of the

succeeding style was first introduced at Westminster Abbey; and we note that Mr. Fergusson does not appear to entertain so high an opinion of its merits as is generally held; it is difficult, he says, to make the circles of which it is principally composed fit pleasingly into the pointed arch; and though the English architects are sometimes singularly successful in overcoming the difficulty, yet it was this difficulty, he thinks, which led to the adoption of flowing tracery both in France and England. Of the perpendicular window tracery, on the contrary, Mr. Fergusson entertains a higher opinion than the popular one: it has the merit not only of fitting any form, but of being mechanically correct in all its bearings and joints; consequently it gave the architects the power of erecting windows of any size without difficulty or fear of the result; and even to the latest period of Gothic it retained its propriety and elegance of design. Like all tracery it was merely a frame-work subordinate to the painted glass which filled the windows, and in judging it, it is always necessary to bear this in mind; used as it was at first it was nearly the perfection of tracery, but it fell in evil days, and it possessed a fatal facility, which had a tendency to bring it down to a prosaic level.

Towards the end of the second volume (p. 279) is a very interesting chapter on the peculiarities of English Gothic as distinguished from that of the Continent. The first peculiarity is in the roofs; during the round-Gothic style, or Norman, style in England, there was no attempt made to vault the central aisle of a large church; they were all roofed with wood; sometimes the æsthetic blunder was committed of imitating the French stone-vaults in wood; probably because it had come to be thought indispensable that a first-class church should be vaulted.

beauty of their vaults. French vaults have generally no ridge rib, and the other vaulting ribs are thin and

ST. PAUL, SARAGOZA. (FROM VILLA AMIL.)

poor; the ridge-rib, the bold projections of the ribs generally, and their greater number, and the profuse

use of sculptured bosses, give a peculiar richness to English vaulting. But, says Mr. Fergusson, beautiful though the stone vaults of early English architects undoubtedly are, it is perhaps after all to be regretted that they did not work out their own system in their own manner. It is more than questionable whether, if the same money had been spent upon timber-roofed cathedrals that was spent on those with vaults, the result would not have been more satisfactory. For instance, — the roof of Westminster Hall is as noble a thing as any vault in the kingdom, and if raised 50 or 60 feet higher, and properly lighted, would have made a nobler nave than any which we possess. Other peculiarities are in the general proportions of the ground-plan and elevation; the Continental cathedrals are lofty and comparatively short, the English are very long and comparatively low; the length of the English cathedrals enabled the architect to project their transepts so as to give the utmost possible variety to their outline, the shortness of the Continental cathedrals made it necessary to keep the transepts down, usually in French examples actually within the line of the aisles. Again the towers of English churches have a much nobler and finer effect than those of the Continental cathedrals; not so much because they are really loftier, as because from the smaller height of the churches they dominate much more nobly over the roof-lines.

AISLE IN TRINITY CHURCH, EDINBURGH.

But when the English architects did, in the thirteenth century, begin to vault their great buildings with stone, they excelled the French in the

The erection of the principal tower over the intersection of the roofs of the church is also an arrangement peculiarly English, and gives a picturesque grouping to our exteriors, which is wanting in the Continental cathedrals. The east ends of English cathedrals are square, with a great east window; the French east ends are composed of a corona of circular chapels; in German cathedrals both east and west ends are commonly apsidal. Another characteristic in English cathedrals is the repose and dignity of their exterior, as compared with the confusion and flutter of the pinnacles, flying buttresses, and other expedients to prevent the building from falling, which characterise the exterior of French cathedrals. And again there is a characteristic difference in the sites selected for the cathedrals of the two nations; ours are placed outside the city with an eye to a commanding or a picturesque situation; and are surrounded by a clear space occupied with green lawn and trees; and encircled at a due distance by the venerable residences of the cathedral officials. The French cathedrals always stand in the market-place, in the very centre of the town; often surrounded by hovels and shops, built even against their walls, and which are not always modern excrescences, but frequently as old as the churches themselves. This difference of situation may have had an effect in producing some of those differences which we have previously noted in the general design; the ample precincts of the English cathedral, and its site outside the town, gave space to exhibit its picturesque and grand exterior effects; the French cathedrals can hardly ever be seen at one view, and their height, and the general sacrifice of exterior to interior effect, are perhaps necessary consequences of their standing in the midst of the tall houses of a town.

Mr. Fergusson's Hand-book supplies a general desideratum in so very excellent a manner that it is quite sure to be very popular; and we shall be disappointed if his popularisation of a comprehensive knowledge of the whole Art, and of true principles of criticism of it, do not produce a favourable effect upon the development of the Art in our modern practice.

A FEW WORDS

ON OUR NEAR NEIGHBOURS' TASTE AND OUR OWN.

POPULAR PAINT—WAR PICTURES.

Present—MAGISTER and AMICUS.

Amicus.—Some one has said, "if a Quaker had been consulted at the creation, what a drab-coloured world it would have been!" No roses or carnations—nor buttercups in the meadows, nor harebells in the woods, but all nature like his costume, brown or gray, like a drawing in sepia or Indian ink!

Magister.—You do the "Friends" injustice; they love flowers as well as other people. Their peculiarity of dress puts them at undue disadvantage with the world: besides, even as to that, it is of excellent texture, scrupulously clean; and the Quakeress lace, for example, ever a marvel for fineness and for neat getting-up, as the ladies say.

Amicus.—Ah! Nature must out somewhere: and if stopped in fine colours, she must out in fine texture. I own I admire a Quakeress: she has a fresh, dairy-maid—new-milk air—neatness and demureness itself. One can fancy her pruning herself in the sunny morning like a bird! I confess I do not admire the gentlemen so much. By the bye, I wonder whether there are any French Quakers? Dear me! a French Quaker would be a phenomenon—a chimæra—a union of opposites indeed—composite to be classed with a centaur or a hippogriff!

Magister.—I don't know whether we can laugh at the "Friends" with a very good grace, as they are only the superlative of what a very great many of us are the positive or comparative; for we have a deal of the early

Puritan about us!—The old commonwealth still clings to us, and sets up plainness as the badge of respectability.—Really as far as house and costume are concerned, these are synonymous terms with a large class.—And this is one stop, mind you, to the freer introduction of ornament and artistic decoration generally about us.

Amicus.—But simplicity is a good wholesome quality; and I think we can have this without being followers of the followers of Fox.

Magister.—I am not one to undervalue it; but simplicity is not plainness, but harmony: and there may be quite as much of this in enrichment as in baldness of parts and colours, and in a decorated entourage, as in one as sober-tinted as a gray north-country village.

Amicus.—Do not say anything against our north-country villages—I have seen a great many of them quite charming!

Magister.—But more from situation and Nature's hand than from man and his ingenuity.

Amicus.—That is regulated so much by the materials the spot affords. You cannot expect a poor cotter to go far afield for bright-coloured stones, while the gray ones lie ready to his hand at the threshold.

Magister.—I have seen Scotch villages that, at a little distance, but for the thin reek from a chimney here and there, and a plaid or two out to dry, had nothing to distinguish them from the boulders around. To be sure, when you came near, you were soon convinced by the rush of the "callants" that you were amid human dwellings! The inhabitants, however, have, as you say, their excuse in poverty or want of means. But it is not so in richer places, with large resources, and where the materials of pleasant decoration are at the easy call of the purse. The want of selection, more than the want of means or of expenditure, is there to be deprecated; nor have we the excuse of the Quakers, who make the matter one of conscience!

Amicus.—Ah! we may learn something in this from our near neighbours. How pretty the French towns are—some of them are gay enough, if you like!

Magister.—Yes, the first step into a French town is enough to convince the Englishman, without the recollection of his passage, that he is in a new land; the aspect of everything is different—gayer—brisker—unaccustomed. The houses have windows and doors, but they are not like ours—their very mouldings and fittings are dissimilar, and their roofs and chimneys are not our roofs and chimneys. The very colours used by the house-painter are of a different family from those he uses here. Indeed, the whole expression of a French room is on a lighter gayer key than an English one, and our countryman, without having time, or being able perhaps, to enter into the details of the causes, is impressed with the amusing novelty of his sensations.

Amicus.—Olfactory and otherwise?

Magister.—I speak only of his eye—which assuredly dilates at what he sees—wonderment becomes admiration, which again perhaps slides into approbation.

Amicus.—But if novelty merely were the cause of this, I suppose it would soon slide back again!

Magister.—I would not father such pleasure and enjoyment derived from French objects solely on their novelty; indeed I am quite prepared to uphold a very different view. It is, however, but fair to premise that novelty itself does form one of their strong points of interest with us. This "novelty" appears an essential part of the French character, and is manifest in almost every phase of life, sometimes for good and sometimes for evil. To the historian it presents a series of changes since the breaking out of the first revolution, that could not have occurred in any other country in five times the time—and in all other subservient and collateral matters, the same mercurial never-resting spirit is evidenced. Love of novelty is a constant living moving principle in Paris, where the very establishment of a thing may be said to be against its continuance! The commencement, the first step towards the

end! The Parisian desires to keep the kaleidoscope continually turning so as to present ever a new set of images. He acknowledges it himself. Nothing is so distasteful to him as "*toujours la même chose!*" and this makes his restless metropolis the head quarters of new things.

Amicus.—And Paris the *merchandise des nouveautés* for all the world! and what wonder, when she receives such encouragement—from our race especially. The Anglo-Saxons, as a body, go to the French for their fashions: it is not only England and Scotland that come "booming" to her for her new thoughts, but even across the wide deep purveyors come from far lands "booming" too. In all our Colonial towns that have worked at all up to a metropolitan pitch, the same reverence is paid to French examples and patterns. The lucky digger's wife at the Antipodes, pours out her husband's "dust" for a French bonnet, and he bears her company in a French watch-chain. But of all our race, no portion go further than our brothers of the United States in their deference to French dicta in all such matters—costume especially.

Magister.—The great branch of novelty making in Paris is of course encouraged to the utmost by her thus having the first market, throughout the world for her efforts and goods of this class, from a cap to a clock-case, and thus it is justly founded on a truly peaceable and commercial footing; but the mine must have been there before it was worked, and very precious ore it has produced. I am armed against novelty for pure novelty's sake when unaccompanied with sterling qualities to support it; but I perceive and acknowledge a vast deal of substantial worth in many of those things in France whose first chief impression on us, as strangers, is that of novelty.

Amicus.—Yes, that has occurred to me as you have been speaking, that there is a wide distinction to be drawn between what are novelties to us as strangers, and which may rather be fixed habits to the people themselves, and those which are novelties and matters of change to themselves as well as ourselves.

Magister.—For instance, as to the key of colour presented by the more frequented towns of France. That, perhaps, in its details, may be a matter in some degree affected by change and fashion, but taken altogether broadly, it may be considered, as you say, among its fixed habits, and from among these fixed habits especially may be culled some things thoroughly worthy of our attention and imitation. On this very point of colour, for instance, in our watering and sea-bathing places, where people congregate, not only for health of body, but for relaxation of mind and amusement, to which every kind of cheerful gay tones are conducive, if the houses had somewhat more of the costume of a Continental town, there would be much gain and no loss. At Brighton, for example, when I have been on the pier and have looked back on the range of terraces that line the cliffs, I have regretted their want of colour, and have felt their appearance would have been vastly improved by a gayer key. Even letting the forms alone, by a better, less puritanic application of paint, a vast improvement might be effected. It would cheer up the frontispiece of the place from the sea, and be a sign, rightly hung out, of its character; not that of a business town, but an offset of the metropolis—a sucker from the main plant taken root by the sea at the end of a long stem of railway! a place of recreation, with which the tones of festivity would be as much in accordance in colour as in sound.

Amicus.—A sort of Herculæum to the modern Rome.

Magister.—Nay, rather a Baïe by its size. Herculæum and Pompeii were decorated enough, and so, no doubt, was Baïe on a grand scale, although no vestige now remains of it.

Amicus.—There was no Vesuvius to preserve it in lava like its cotemporaries—like a naturalist putting live creatures in spirits to retain their gay tints!

Magister.—In France one of the remarks that arise on observing the popular use of colours and paints that give a certain air of gaiety even to the otherwise forlorn and dilapidated portions of the suburbs and "allées" of Paris,

is, that with all their variety they are seldom gaudy, and that their lightness, contrast, and effect more depend on the harmony and knowledge of effect with which they are arranged than on their individual brightness and force. The first thought of the Englishman is whether the colour will stand, with the Frenchman whether it will be pleasing and admired. If the Englishman depart from some very sober "respectable" colour, such as invisible green (which looks black) and so forth—he is likely to indulge in some positive primary colour in full force—and some sudden contrast probably close to it! But not so our near neighbour. If he select one strong pure colour, he will put "no rival near its throne," but will soothe it down to placidity by associating with it subservient secondary or tertiary colours. Assuredly in their use of the broken tints the French workmen are more *au fait* than ours. I am speaking now of the general effect of the towns, and contrasting them with ours to our disadvantage. Doubtless with us a very just knowledge is increasing of colour in appliance to dwellings inside and out, but the circle of information is not so wide. The knowledge of these matters has a much more extensive and popular orbit there than here, and the artist and the workman step more together in France than in England, as has been often said.

Amicus.—The results forming part of national taste?

Magister.—Yes.—Painting, sculpture, architecture, decoration, even the character of dress, being connected with each other as higher or lower branches of the same subject, national tastes are evidenced and illustrated by each and all of these.

Amicus.—In talking of national taste, it is very natural to turn to painting and its national characteristics and peculiarities. Is it not a strange thing that a people (I still mean our neighbours) whose dramatic proprieties will not allow of a death on the stage, can yet witness without reprobation and I suppose with some degree of satisfaction deaths and death-pangs represented in another Art, enhanced too with every ingenuity of horror. I am thinking and speaking somewhat abruptly I know—(but it has just struck me apropos of taste—and I want to know whether it is to be considered good taste?)—of a picture I saw among the modern French pictures at the Beaux Arts Exposition. I forget the exact name of it, but it represented a decollation, and not a frightful detail was omitted that could imbue it with its utmost effect. It was a thing to make you stop and shudder! The gore from the victim is caught in a dish by a black female, who gloating fiendishly on the sight of the agony, involuntarily gapes her mouth with a sympathetic gasp! And the gazer for the moment could hardly help doing the same thing.

Magister.—It cannot be denied that as regards horrors as subjects for art, the tastes of our neighbours and ourselves are widely apart. We avoid them—they seem to welcome them; and I certainly think we have the best of it. I recollect the picture, for such scenes have a fatal attraction, and are not so easily wiped out of the recollection. They seem to possess, among other evil qualities, the fascination of the serpent; for there is unfortunately in most minds a morbid weakness, on which such harrowing subjects eagerly clutch. Our neighbours, however seem to cherish the "morgue"-like sensation. "Grind plenty of the red" has been repeated as the exclamation of David, the historic painter, during the first revolution, and the French palette seems never to have forgotten the injunction. French galleries of art teem with battles, executions, and death-struggles.

Amicus.—Our neighbours' military tastes, and the delights they take in the pomp and circumstance of glorious war, familiarise them, no doubt, with such crimson results.

Magister.—And, in consequence, a larger portion of such subjects are to be seen in French galleries than in those of other nations. The Versailles collection alone contains enough battles and onslaughts to supply the whole world—unredeemed, too, as many of them are, by the excellencies visible in some of the later

contributions; such as Vernet's scenes from the late wars in Algeria; of which the vigour, variety, truth, movement, and character half excuse the terrors they portray.

Amicus.—But how the French people like them! What holiday attractions they are. I have seen the room which is appropriated to them at Versailles thronged with gay Parisians, taking evidently the extremest delight in those scenes of rapine and bloodshed, and hanging with the eye of connoisseurship over struggles so faithfully represented that you may fancy you hear the cry of despair and the death-shriek of agony. The gestures and gesticulations of admiration among the visitors, from even the women and children, show how unaffected is the delight they derive from these presentations.

Magister.—It certainly is enough to make an artist apply himself to such subjects, and to spur him on the path, when such is the appreciation that follows. But the feeling for such here would be very different; and what would please across the water, would shock us on this side: and this is not one of our characteristics that I would wish changed. Admirable, however, as these works are, you will agree with me, no doubt, that they did not gain by their removal from the place for which they were painted, at Versailles,—where it appears we have both seen them—to the apartment in the Beaux Arts. They appeared to me to lose much by being placed too near the eye: their slapdash and scenic style of workmanship became too evident, and emphasized still more strongly the rank I have always given them as works of execution, that is—but the tiptop of panorama painting. In this respect they are not up to the mark of "standard works," although they display vast powers, unparalleled resources, and magical facility. As regards these, indeed, the artist is a marvel. I was told by a friend, who was well acquainted with him, and had the "entrée" while he was at work, that when he was engaged on this very series, he called on him one morning, and being asked his opinion of the work in hand, he freely objected to a principal figure which Vernet had just put in. Having occasion to leave the artist and to return after two hours, he was surprised to see a wholly new figure completed in its place! Within this short space of time, the artist, accepting the criticism with the true frankness of genius, had wiped out the noxious figure, and completed another in lieu of it!

Amicus.—And what makes it the more extraordinary is what I have heard, that he rarely makes use of models, so that he must do it, as boys say—"all out of his own head."

Magister.—Nay the close copying of models were inconsistent with such facility. An artist even of equal powers, who worked close by nature, would not have been capable of the foregoing marvel, although the style of his work might be more sterling; for facility is often its own bane, producing the very slap-dash which makes the shortcomings of these works; and it often produces a conventionalism lacking of Nature's essence.

Amicus.—That latter observation you would not apply to Vernet's works. We have just said they were only too natural.

Magister.—In one respect, but as works of execution—in detail and completion—not quite complete. Even Vernet's memory of Nature will not reach to the minutest refinements.—But what a recollection he has!—I suppose he never forgot a group or an action.—There on his memory it is daguerreotyped for ever! For the details of battles his resources appear endless!

Amicus.—No wonder!—for the story goes that on occasion of his visit to the East, at the commencement of the Crimean hostilities; on his giving his opinion on some point of the War, before the late Marshal St. Arnaud, the latter alluded to its being at any rate not a professional opinion—when the veteran artist retorted—it is said with truth—"Marshal, I have been in more battles than you!"

Magister.—Dramatic enough—the sword in one hand and the brush in the other, and either proud of the other. I saw him once at St.

Cloud on a fête day: ancient, upright, "svelte," active, with every ounce of superfluity evaporated by the heat and motion of the restless spirit within. His whole chest, from shoulder to shoulder across, and from waist to gorge, was blazing with decorations! I thought him a General at least!—till I was undeceived—but he was no less—

"A king can make a belted knight,
A royal duke—and a' that."

A monarch may make many generals, but not a Horace Vernet!

Amicus.—He is a true son of France, and a vast favourite with his countrymen.

Magister.—His works have deservedly a large public in France, for they are exactly in accordance with the national taste. They are moreover state engines—fostering the love of the people for military distinction. To be enshrined in a *tableau* of Vernet's, were the height of ambition to the young aspirants of the *Ecole Militaire*. His works send many a recruit to the army.*

ART IN THE PROVINCES.

BIRMINGHAM.—The exhibition of the works of the pupils of the school of Art, which has been open here, is now closed: the local papers speak in very favourable terms of the contributions of many of the students, and of their general progress:—"On the whole, this exhibition proves that the local administration of this school, and the instruction imparted therein, are of a very satisfactory and gratifying character; and apart from the head master (Mr. George Wallis), the thanks of the public of Birmingham are due to Mr. Daniel Wood, the deputy head master; Mr. William Wallis, the elementary master of the central school; and to Mr. Walker, to whom is confided chiefly the practical working of the classes in parochial schools, and of the class at the Worcester Diocesan College, Saltley, where, according to Mr. H. Cole's statement at the meeting, referred to elsewhere, the students have been pre-eminently successful at the last examination in drawing. It is quite clear that an earnest spirit is at work in this district; and it is equally clear that the fault of any lack of progress in future will lie at other doors than those of the head master, and those acting with him, in the work for which he is responsible."—Prior to the close of the exhibition, Mr. Wallis delivered a lecture, explanatory of the course of instruction, as illustrated by the works of the students, to a large audience, composed chiefly of artisans.

NORWICH.—The committee of the Norwich School of Art recently invited the friends and patrons of the institution to a *conversazione* at the school-room in St. Andrew's Street, an invitation that was accepted by a large number of the most influential inhabitants of the city and its immediate neighbourhood, as the chief object of the meeting was to promote a taste for Art among the citizens; and for this purpose there was a very considerable collection got together of pictures, drawings, engravings, photographs, and illustrated books. The large class-room contained a variety of artistic productions by the students, including the drawings which lately obtained medals from the Department of Science and Art in London. During the evening Mr. J. H. Gurney, M.P., addressed the company on the present and future prospects of the school; in the course of his remarks he said, "In the public schools there are 79 pupils, and in the special and intermediate 44, making a total of 123, which, I am informed, shows an increase in the second class during the past year. There are 850 pupils belonging to the public schools, making a total of 937, who are reaping the advantages of this institution." It seems that the number of medals—ten—recently awarded to the pupils of the Norwich school was much larger than those awarded to any other school, in proportion to the population of the places, respectively, which came into competition. This speaks most favourably for the judicious system of training pursued by Mr. Claude L. Nursey, the head master. Sir H. Stracey, Bart., M.P., Sir S. Bignold, M.P., and the Mayor of Norwich, Mr. J. G. Johnson, also delivered their sentiments on matters connected with this institution before the assembly broke up.

CAMBRIDGE.—The Exhibition in aid of the Patriotic Fund, which has been for some time in preparation, under the patronage of H.R.H. Prince Albert, Chancellor of the University, and

* To be continued.

of many of the most distinguished members of that soot of learning, opened on the 11th of February, and gave an agreeable surprise to the visitors. Not only have valuable pictures been collected from the neighbourhood, but Cantabs, by their influence and exertions among friends, have discovered and drawn out considerable amateur talent from all parts of the country. The exhibition contains pictures by Claude, Both, Watteau, Berghem, Holbein, Rembrandt, Vandyck, among the ancient masters; and by Turner, Frost, Gainsborough, Lee, Clint, Herring, Copley Fielding, Dallas, Richmond, among modern painters. The works of Mr. and Miss Colkett, of Cambridge, attracted much notice. C. Jenyns, Esq., Dr. Phelps, W. Hopkins, Esq., and Miss Hopkins, contributed liberally from their excellent collections. We believe the origin of this exhibition, and no small part of its ultimate success, are due to three or four young "gownsmen," lovers of Art, who worked hard during the last long vacation to promote the object: they deserve all credit for the highly satisfactory result of their labours. It is to be regretted that the committee talk of closing in a month's time: we trust the energy displayed will be so earnestly responded to by the town and its visitors, as to justify them in keeping the exhibition open for some time longer.

OXFORD.—"The collection of objects of Art," says the *Athenæum*, "which Mr. Chambers Hall presented to the University Galleries at Oxford, has been arranged in a room leading from the staircase to the long gallery, which contains the original drawings by Raphael and Michael Angelo. Mr. Hall's collection affords specimens of great variety, but of unequal merit. Some might have been well spared. Among the antiquities are a few exquisite bronzes with the blue Pompeian patina upon them, — a graceful *Præfericulum* and several vase handles deserving especial attention. — also some terra-cotta griffins, gilded figures, gem rings, and a small vase of whitish clay, picked out with a greenish tint, which affords another proof in its figures and ornaments of the connection between Assyrian and Etruscan Art. A small mounted drawing of the head of the Madonna in red chalk, by Leonardo da Vinci, is very questionable. Not so a beautiful drawing by the same master, with silver point on prepared reddish ground, representing two sitting figures and some mechanical devices. These, and a drawing by Raphael of 'The Nativity,' which has been engraved in fac-simile in Ottley's 'School of Design,' belonged to the Lawrence collection. These precious drawings are fortunately re-united as nearly as possible to the large mass happily detained in our own country at the time of the first sale of Sir Thomas's treasures. Two other fine drawings by Raphael, 'The Presentation' and the 'The Child in La Belle Jardinière,' hang on the same wall; and near the door is a magnificent cartoon of a 'Holy Family' by Razzi, in Sodoma. A small model in wax by Michael Angelo of the female figure of 'Morning,' for the monument of Lorenzo de' Medici, is evidently a first thought. The modern pictures include a fine portrait of Mrs. Bradyll, by Sir Joshua Reynolds, — two sketches of Garrick as Abel Druggier, by Zoffany, — a portrait of Thornhill, by Hogarth, and his sketches for the 'Country Inn Yard,' 'A conversation of Connoisseurs,' and 'The Enraged Musician.' Pictures with greater names are less satisfactory. An exaggerated portrait of the donor, by Linnell, fails to convey the benevolence of expression which all who knew him must remember. He left also an ancient painting from Herculanum of a seated female, attended by Cupid holding a toilet-box. It is inserted in the wall of the staircase, near the Nisroch sculpture presented by Mr. Layard."

LEEDS.—Mr. J. C. Swallow, principal master of the Leeds Government School of Art, has recently delivered some lectures on ancient ornamental art as practised by the Egyptians, Greeks, and Romans, illustrated by diagrams. In his introduction he remarked, that to a manufacturing nation like England, a knowledge of ornamental art must be a subject of vital importance. It had for its object the improvement and adornment of manufactures; and as a superior and improved article will always be preferred, a knowledge of ornamental art must tend to extend and increase the demand. This knowledge, therefore, becomes a question for the consideration of all classes. Ornamental art could not be confined to a class. It operated with the patron or purchaser, with the producer or manufacturer, and with the workman. The first inquires, according to his knowledge, for the most beautiful thing for his money. The second finds that he meets with a readier sale, and can obtain a higher value for extra beauty. The architect, as a producer, finds ornamental beauty a great addition and recommendation in his profession. In fact, whatever may be the thing produced or manufactured,

ornamental art adds greatly to its value. The workman, too, could obtain higher wages and better employment by his knowledge of the ornamental. The claim of nations to high civilisation is based upon their knowledge of, and progress in, ornamental art. We must judge of them by their buildings, their decorations, and the improvement and beauty of their manufactures. Mr. Swallow, in his third lecture, said the Saracens did not build mosques, but they left several palaces, and one in particular at Palermo, which takes its name from the last word of an inscription, *à la ziza*, and was called by the Italians, *La Ziza*, or the Zig-zag. And there we get, he said, the origin of the word "zig-zag;" and the importation of the peculiar zig-zag form is a characteristic of Norman in this country and in France.

BATH.—The second conversazione of the Bath Society for the Promotion of the Fine Arts took place on the evening of February 12th, and was very fully attended. The large assembly room was used for the display of oil pictures, while the octagon was appropriated to the drawings, sketches, photographs, &c. The most important works contributed on this occasion were Turner's 'Burning of the Houses of Parliament,' and Landseer's 'Waiting for the Deer to Rise,' both the property of Mr. Wallis; 'The Light of the World,' and 'The Strayed Sheep,' by H. Hunt, belonging to Mr. Maud; 'The First Step,' by T. Faed; 'Diogenes in Search of an Honest Man,' by T. Barker; 'Too Hot for the Fish to Bite,' by J. Burnet; there was also a large collection of pictures and drawings framed, and drawings in portfolios, by H. Johnson, Woolmer, J. Philip, Blacklock, H. B. Willis, Bright, A. Fripp, Jutsum, Jackson, Syer, Luny, Mr. and Mrs. Duffield, Warren, Robins, Branwhite, Shayer, Rankley, F. Goodall, A.R.A., Lance, David Cox, Collingwood Smith, Topham, Müller, Pyne, J. Danby, Rosenberg, Havell, Gosling, Horlor, &c. &c.; the "gathering," as a whole, was of a right good order.

LIVERPOOL.—The committee of the fund raised as a testimonial to the late Mr. H. L. Elmes, the architect of St. George's Hall, in Liverpool, have decided to allow to the widow the interest on the sum now collected, about 1400*l.*, and at her decease to the surviving son. At his death, two scholarships, to be called the "Elmes Scholarships," for Architectural students, or students of the Fine Arts, are to be founded, and to be made available for two years each to pupils of the Royal, the Collegiate, or the Mechanics' Institution, as the trustees for the time being may decide, on the merits of a specific examination for the purpose. — The following pictures were purchased by collectors from the gallery of the Liverpool Academy of Arts, at the exhibition recently closed: — 'A Watercourse in July,' A. FRASER; 'The First Thought of Murder,' W. DOUGLAS, R.S.A.; 'The Lesson,' J. STIRLING; 'The Idlers,' G. PAGET; 'Haymaking,' C. DAVIDSON; 'Falkland Palace,' A. FRASER; 'Carnarvon Castle,' W. J. J. BOND; 'The Twentieth of August,' J. HARDY; 'Mechanical Science adding Speed to the Wheel,' F. M. MILLER; 'Antiquarian,' DE BLOCK; 'Mill near Ashford,' A. FRASER; 'Ireland's Mansion,' T. N. HENSHAW; 'Peace,' F. M. MILLER; 'War,' F. M. MILLER; 'A Snug Retreat,' R. P. BURCHAM; 'Fish Girl,' MISS S. BRIGHT; 'The Source of Nantlle River,' J. W. OAKES; 'Relics of Bygone Days,' A. PENLEY; 'Ariel,' F. M. MILLER; 'Bonchurch, Isle of Wight,' W. COLLINGWOOD; 'Liverpool from Seacombe,' W. J. J. BOND; 'Near Kenilworth,' MRS. W. OLIVER; 'Carnarvon Castle,' MRS. HAY; 'Fast Bind, Fast Find,' J. PELHAM; 'Covenanter Listening to a Preacher,' E. H. HARDEN; 'On the Banks of Loch Ness,' W. S. ROSE; 'Welsh Scenery,' B. SHIPHAM; 'Falls on the Isla, Forfar,' G. L. BEETHOLME; 'A Nubian, Upper Egypt,' J. F. LEWIS; 'Early Morning, on the Rhine,' MRS. W. OLIVER; 'Venice,' E. PRITCHETT; 'Tabernacle of St. Peter,' J. DOBBIN; 'Loch Scene,' F. WATTS; 'Villagers Going Home,' J. PEEL; 'Flower Girl,' F. M. MILLER; 'The Poet's Haunt,' W. HAVELL; 'Fowls and Pigeons,' W. HUGGINS; 'Waterside Vegetation,' E. HARGITT; 'Coron Mill, Anglesey,' — Evening, J. W. OAKES; 'Enamel of a Fox's Head,' W. ESSEX; 'View on the River Maas,' G. CHAMBERS; 'Clean your Boots, Sir?,' J. E. MARTIN; 'Harvest Girl,' O. OAKLEY; 'The Teataller and Tippler,' J. HAYLAND; Marble statuette, — 'The Good Shepherd,' P. VANLINDEN; 'The Devil's Bridge,' W. C. SMITH; 'The Archbishops' Tombs,' L. J. RAYNER; 'Riviere de Levante,' C. VACHER; 'A Summer's Morning,' H. J. BODDINGTON; 'Birds' Nests,' J. H. BIRCH; 'Loch Katrine,' S. B. PERCY; 'Interior,' a Sketch, T. ROCHE; 'An Orange Girl,' W. CRABB; 'Griselda,' J. BOUVIER, Sen.; 'The Village Common,' A. PERRY; 'Rue du Caudet,' L. J. WOOD; 'The Navvies' Dog in the Crimea,' J. ZEITTER; 'Welsh

Peasant,' G. YOUNGE; 'Graystock Castle,' W. HAVELL; 'The London Orange Girl,' J. STIRLING; 'Scene at the Entrance of Newhaven Harbour,' the late C. FIELDING; 'Incident in the Desert,' J. A. HOUSTON, R.S.A.; 'Scene near the Handeck,' H. SHERIDAN; 'Beach View, New Brighton,' J. WAKE; 'Old House, near Chester,' R. CLOTHIER; 'Sundawn,' E. HARGITT; 'Ben Nevis,' J. S. RAVEN; 'Late at School,' W. BROMLEY; 'The Milkmaid,' B. CALLOW; 'View in Tilgate Forest,' the late C. FIELDING; 'Dysart, coast of Fife,' S. BOUGH; 'Smiler,' a Study, N. BRANGWIN; 'Evening on the Ouse,' R. STUBBS; 'Harbour and Town of Calais,' A. BREBANT; 'A Cloudy Day in August,' H. B. WILLIS; 'Fisherwomen of Portal,' U. BOUVIER; 'Little Nelly,' C. COMPTON; 'A Corner in the Hayfield,' J. BOUVIER; 'View on the Trent,' B. SHIPHAM; 'Castle of Ehrenberg,' MRS. W. OLIVER; 'Pomerne on the Moselle,' MRS. W. OLIVER; 'The Miller's Daughter,' E. HAVELL; 'The Rest by the Wayside,' T. P. HALL; 'Richmond Park, Surrey,' G. C. MAUND; 'A Partridge,' MISS J. BOUVIER; 'Distant View of Osborne,' E. DUNCAN; 'The Truant's Return,' J. SMETHAM; 'Venice, from the Church of San Giorgio,' W. CALLOW; 'Venice, from the Foscari Palace,' W. CALLOW; 'Spring,' E. HAVELL; 'Early Spring Evening,' W. DAVIS; 'Nature and Art,' G. LANCE; 'A Sketch,' J. CALLOW, Junr.; 'Adam and Eve,' H. C. WHAITE; 'Scene in Edinburgh,' W. G. HERDMAN; 'A Brown Study,' W. HUGGINS; 'In the Vale of Neath,' A. VICKERS; 'Eton College, Bucks,' W. PARROTT; 'An Embroiderer,' E. J. COBBETT; 'Free Trade and Protection,' J. BUCHANAN; 'Fishing Boats on the Coast of Sussex,' W. WILLIAMS; 'Port Glasgow, Evening,' S. BOUGH; 'Remains of Stokesay Castle,' MRS. HAY; 'In South Wales,' T. FROWD; 'Neetwood Kilns,' C. DAVIDSON; 'A Mallard,' G. HICKIN; Pictures selected by the Liverpool Art-Union Prizeholders: — 'Shallows on the Llugwy,' F. W. HULME; 'Flowers, &c.,' R. CLOTHIER; 'Morning on the Mersey,' R. CLOTHIER; 'The Mountain Stream,' J. HILL; 'Staircase at St. Maclou,' J. NASH; 'Digging for Lobsters,' C. DAVIDSON; 'On the Shore, Farnby,' W. J. J. BOND; 'Interior, Haddon Hall,' S. D. SWARBRICK; 'Blarney Castle, Ireland,' J. DOBBIN; 'Interior of Crypt at Wingfield Manor House,' W. G. HERDMAN; 'The Keep, Carisbrook Castle,' W. GRAY; 'Easby Abbey, Yorkshire,' S. D. SWARBRICK; 'The Royal Fugitive,' W. COLLINGWOOD; 'A View on the River Erne,' E. H. HURDLE; 'Mills at Montreux,' W. COLLINGWOOD; 'A Welsh Trout Stream,' A. F. ROLFE; 'Rustic Cottage,' J. CALLOW; 'The Penitent,' F. P. HALL; 'The Stable Door, Haddon Hall,' A. PENLEY; 'Interior of the Hall, Magdalen College,' J. NASH; 'Autumnal View in Richmond Park,' H. C. PIDGEON; 'Entrance to the Keep, Richmond Castle,' S. D. SWARBRICK; 'Pool on the Llugwy,' A. HUNT; 'Bidston Marsh,' A. W. HUNT; 'The Highlander's Departure,' H. ROBERTS; 'A Chimney Nook,' J. CAMPBELL; 'Experimental Philosophy,' J. BUCHANAN; 'At Jersey,' A. MONTAGUE; 'Nant Mill, N. W.,' G. D. CALLOW; 'Snowdon,' J. HORLOR; 'Bern Castle,' MRS. W. OLIVER; 'Pheasant,' J. D. WATSON; 'A Sketch from Nature,' J. WAKE; 'Homestead, Watering Cattle,' A. R. C. CORBOULD; 'A Salmon Pool,' A. F. ROLFE; 'Lane Scene,' J. CALLOW; 'The Mountain Spring,' J. BOUVIER, sen.; 'The Paper, Please,' W. ROMER; 'Antwerp Cathedral,' J. DOBBIN; 'The Cheshire Coast,' B. CALLOW; 'Landscape,' F. WATTS; 'An Avenue in Hatfield Park,' H. JUTSUM; 'A Weedy Bank on the Thames,' H. J. BODDINGTON; 'The Timber Wagon,' J. HORLOR; 'Moel Siabod,' S. BUSS; 'The Church at Harfleur,' A. MONTAGUE; Pictures purchased by the Glasgow Art-Union: — 'Birk Crag,' G. C. STANTFIELD; 'Adeline,' W. COLLINGWOOD; 'Preparing Dinner,' J. F. PASMORE; 'An Interior at Kerlemd,' A. PROVIS; 'The Lesson,' W. WEIR; 'View from the Top of Llanbertis Lake,' W. PITT; 'Departing Day,' W. FREEMAN, jun.; 'Ducks,' C. H. WEIGALL. The total sales amount to 2956*l.* 1*s.*, of which the private sales amount to 2057*l.* 1*s.*; the Liverpool Art-Union Prizeholders took 667*l.* 7*s.*, and the Glasgow Art-Union 231*l.* 13*s.*

GLASGOW.—The Art-Union of Glasgow has issued its first list of pictures purchased for the prizeholders of the current year. It contains, among others of smaller pecuniary value, the following: — 'Ben Blavon, Isle of Skye,' H. McCULLOCK, R.S.A., 200*l.*; 'Cottage Window,' R. GAVIN, A.R.S.A., 150*l.*; 'Caught Again,' E. NICOL, 130*l.*; 'Summer Trophies,' J. SANT, 126*l.*; 'Grouse, &c.,' G. W. HORLOR, 120*l.*; 'The Dancing Lesson,' R. T. ROSS, A.R.S.A., 115*l.*; 'The Villa Fountain,' W. L. LEITCH, 100*l.*; 'The Household Gods in Danger,' J. FAED, R.S.A., 84*l.*; 'View in North

Wales,' J. C. WARD, 70L.; 'Red Tam, Helvellyn,' G. W. PETTITT, 60L.; 'A Pleasant Way through the Welsh Woods,' H. J. BODDINGTON, 60L.; 'The Lynn Spout, near Dalry,' H. McCulloch, R.S.A., 60L.; 'The Stepping Stones,' E. J. COBBETT, 55L.; 'The Edge of the Wood,' F. H. HENSHAW, 50L.; 'Birk Crag, near Hattowgate, Yorkshire,' GEORGE G. STANFIELD, 50L.; 'Adeline,' W. COLLINGWOOD, 50L.; 'Stiff Breeze,' E. T. CRAWFORD, R.S.A., 45L.; 'In the Island of Atran,' E. HARGITT, 45L.; 'A Forest Brook,' JAMES STARK, 40L.; 'An Interior at Kerlindi, near St. Poll de Leon, in Brittany,' A. PROVIS, 40L.; 'Early Morning on the Thames,' H. J. BODDINGTON, 40L.; 'A Thought from Boccaccio,' A. J. WOOLMER, 30L.; 'Rustic Figures,' J. J. HILL, 30L.; 'Poetry, Music, and Painting,' K. HARTMANN, 30L.; 'A Woodland Pool,' B. WILLIAMS, 25L.; 'The Margin of Ennerdale Water,' G. W. PETTITT, 25L.; 'Chalk Pit, Garton, Surrey,' C. DAVIDSON, 25L.; 'Catherine of Arragon (a Study),' H. O. NEIL, 25L.; 'Lewis Castle, Sussex,' C. DAVIDSON, 25L.; 'Roslin Glen, Wintour, 25L.; 'Cupids in a Shell,' JOHN GEO. NAISH, 25L.; 'Haddon Hall,' E. HARGITT, 25L.; 'On the Berwick Coast,' R. T. ROSS, 25L.; 'The Rainbow,' J. SIMMONS, 21L.; 'Shall I Tell your Fortune,' JAS. CURNOCK, 21L.; 'May,' K. HERDMAN, 20L.; 'Study of Salmon and Trout,' H. L. ROLFE, 20L.; 'The Borders of Derbyshire and Staffordshire, near Stapenhill,' J. PEEL, 20L.; 'Scotch Terriers,' T. EARL, 20L.; 'A Path through the Woods, N. Wales,' H. J. BODDINGTON, 20L.; 'Preparing for Dinner,' J. F. PASMORE, 20L.; 'Floral Emblems,' J. COLBY, 20L.; 'Snowing,' G. A. WILLIAMS, 18L.; 'The Terrace Avenue, Haddon,' R. H. LINES, 18L.; 'Study from Nature,' WINTOUR, 18L.; 'Entrance to Canterbury by West Gate,' J. HENSHALL, 18L.; 'The Blind Father,' K. HARTMAN, 17L.; 'The Old Library,' B. WILLIAMS, 15L.; 'Fishing Boats in a Fresh Breeze, off the Bayley Lighthouse, Dublin,' E. HAYES, 15L.

WARRINGTON.—We are desirous of correcting an error in our notice last month of the fancy fair recently held in this town: the master of the school is Mr. Thompson, and not Mr. Brewtnall, as we stated: the latter gentleman is secretary, and to his exertions the success of the bazaar is mainly owing.

ART IN CONTINENTAL STATES.

PARIS.—The author of the panoramas lately exhibited in the Champs Elysées, Colonel Langlois, is now at Sebastopol, by orders of the French government, to execute a panorama of the town and forts. —A new "Salle" is opened in the Louvre, containing sculptures and bas-reliefs of the middle ages.—A museum has been opened at Napoleon Veudé, for painting, sculpture, and local antiquities.—Delaroche is hard at work repairing the "Hemicycle."—The scaffolding of the Caroussel has been taken down, and the public is admitted to see the splendid buildings; if there is any fault to be found in them, it is in the superabundance of ornament.—It is reported that Clesinger, our excellent sculptor, is about to emigrate to England, in consequence of his fine equestrian statue of Francis I. having been rejected by the government, and from disgust with the intrigue and partiality displayed here in every department of Art, &c.*—Yvon, author of the "Retreat from Moscow," exhibited last year, is in the Crimea, studying the sites, in order to execute several of the great battles.—An immense number of churches have been given into the hands of artists for decoration; Signol, Gourlier, Marquis, Glaize, &c., have received commissions; generally the churches are being overcharged with all sorts of ornaments, Byzantine, &c., by which all simplicity will be lost, until time tames down the glare of colour: the church of St. Elizabeth, Rue du Temple, ornamented with rich wood carvings, mural paintings, and stained glass, is one of those which has been most favoured by municipal liberality.—The sixth exhibition of Bordeaux has been opened with great success; most of our great artists have contributed works. Several gifts have been made by the Minister of State for the lottery which follows the close of the exhibition.—Sebastian Cornu has executed many excellent paintings at St. Severin.—Two statues in bronze, half life size, have been placed in the Champs Elysées, representing respectively Buffon and Olivier de Serres; also one of Marshal Gerard.—The Minister of State has ordered of M. Elias Robert two groups for the Avenue de l'Impératrice, Bois de Boulogne.

* This statement of our correspondent is denied in other communications from Paris which we have seen.

THE ROYAL PICTURES.

MIRIAM.

W. Hensel, Painter. H. Bourne, Engraver.
Size of the Picture, 6 ft. 2 in. diameter.

HENSEL, one of the most distinguished living painters of the school of Berlin, is the son of a clergyman, and was born at Trebbin, in 1791. He evinced at an early age a taste for the Fine Arts, but his parents, having another object in view, sent him, when sixteen years old, to Berlin, to qualify him for a post under the Government. The death of his father very shortly after he had gone to Berlin, removed the chief obstacle in the way of his entering upon the life of an artist; and encouraged by the director of the Academy, Frisch, Hensel commenced his studies in right earnest. In the Berlin Art-Exhibition of 1812 appeared his first oil-pictures—a portrait of himself, and "Christ on the Mount of Olives," the latter showing considerable feeling and devotional character. During the three following years the pencil was exchanged for the sword, and the time was passed amid camps and battles, in rolling back upon France the tide of war which she had thrown upon the nations of the continent. On the restoration of peace in 1815, Hensel resumed his occupation at the easel; but his success at first was not commensurate with his zeal; he therefore abandoned historical painting for a time, principally because he had a mother and a brother dependent on him for support. Money it was essential he should earn; and to accomplish this purpose, he made drawings and engraved etchings for almanacks and other similar publications, and also painted portraits. He at length received a commission to paint, in one of the saloons of the new theatre, a series of subjects taken from the most celebrated tragic authors: several of these have been engraved in outline. To this period also may be traced the most eventful epoch of his life—a journey to Italy, for which the King of Prussia furnished him with the necessary means. Prior to his starting, however, he was charged to execute the portraits of a number of distinguished persons who had taken part in a grand fête at court in a sort of *tableau vivant* of "Lallah Rookh:" these portraits are all in costume.

Hensel set out for Rome in 1823; he there made a copy, the size of the original, of "The Transfiguration," by Raffaele; this copy is in the chapel of Charlottenburg. At Rome, too, he painted a large picture of "The Good Samaritan," which is in one of the country palaces of the King of Prussia, placed most disadvantageously among many other pictures of different kinds; had it formed an altar-piece in some church, it would be seen with far better effect. Returning to Berlin in 1828, Hensel became a member of the Academy, and was appointed painter to the King. He married the sister of Meudelssohn, the renowned composer.

The most important picture painted by Hensel is the property of the King of Prussia; the subject is "Christ before Pilate," a large work, with a vast number of life-size figures. It is in the church of the garrison of Berlin, and, having a good light, is seen to great advantage. Another fine work of this master is "Christ in the Desert," of colossal dimensions.

His "Miriam" was painted in 1836; it represents the Israelitish maiden at the head of her countrywomen, chaunting her song of gladness at the destruction of the hosts of Pharaoh: "Sing to the Lord, for he hath triumphed gloriously; the horse and his rider hath he thrown into the sea;" or, as Moore has beautifully paraphrased the song,—

"Sound the loud timbrel o'er Egypt's dark sea;
Jehovah has triumph'd, and Israel is free."

The composition is rich in poetical sentiment, and is characterised by exceeding grace in the principal figures, especially in the female with the harp; it is powerfully coloured: the figures are life-sized.

The picture is in the collection at Osborne.

COPYRIGHT IN ENGRAVINGS.

AN interesting case has been heard before the Vice-Chancellor, Sir William Page Wood, application was made on the part of Mr. Cassell (the well-known publisher of cheap illustrated publications), to restrain Messrs. George Stiff and George Vickers (also publishers), from selling, or exposing for sale, or hire, or otherwise disposing of, or causing, procuring, or permitting to be sold or exposed for sale or hire, any copies or copy of any of the parts or numbers of the *London Journal*, already published, containing any prints, drawings, woodcuts, engravings, names, designations, letter-press, copied or colourably altered from the periodical French work, *L'Illustration*; and also from printing, or publishing, or selling, or exposing for sale or hire, or otherwise disposing of, or causing, or procuring, or permitting to be printed, published, sold, or exposed for sale or hire, or otherwise disposed of, in any future parts or numbers, or in any future part or number, of the *London Journal*, or in any other publication, any print, drawing, wood-cut, engraving, illustration, passage, article, paper, matter, or thing taken or copied, or colourably altered from any print, drawing, wood-cut, &c., contained in any of the numbers of the periodical *L'Illustration*, already published, in which Mr. Cassell has copyright, or which shall or may at any time or times hereafter be contained, printed, and published in any of the future numbers of *L'Illustration*. The plaintiff's bill asked an account of profits made by partial copies of prints from *L'Illustration*, and a decree for payment of such profits when ascertained. The plaintiff, Mr. Cassell, stated that prior to June, 1855, Armand le Chevalier and Alexandre Paulin, of No. 60, Rue Richelieu, Paris, were the editors and proprietors of *L'Illustration Journal Universel*, a periodical published every Saturday in Paris. It was alleged that Messrs. Armand le Chevalier and Paulin had made such agreements with the authors and designers of articles and papers, and of prints, drawings, and engravings which appeared in *L'Illustration*, as to confer on them a perfect right to the exclusive benefit derivable from that work, under the international convention between England and France relating to copyright, concluded between her Majesty Queen Victoria and the French Republic in 1852, and under the 7th and 8th Vict., c. 12, the act to amend the law relating to international copyright; and under the 15th and 16th Vict., c. 12, which was passed to enable the Queen to carry into effect the convention with France in respect to copyright, to extend and explain the International Copyright Acts, and to explain the laws relating to copyright engravings. Messrs. Armand le Chevalier and Paulin had, pursuant to the requisitions of the 15th and 16th Vict., c. 12, signified their intention of preserving their copyright and the right of translation here, by a notice printed on the title-page of their periodical. The plaintiff stated that in June last he negotiated for the purchase of the English copyright of *L'Illustration*, and on the 18th of that month, entered into an agreement with Le Chevalier and Paulin, that they should, in consideration of his taking of them and paying for, at rates specified, the copyright of the engravings, woodcuts, or drawings to be contained in *L'Illustration*, the aggregate amount to be paid being stipulated to amount annually to 12,500*l.*, sell and assign to Mr. Cassell their copyright in this country in the periodical work *L'Illustration*; and Messrs. Le Chevalier and Paulin, on the 21st of June last, caused the work *L'Illustration* to be registered at Stationers' Hall, as prescribed by the statutes, and deposited a copy of the work, and caused an entry to be made in the registry book there, of the assignment to Mr. Cassell, as prescribed by the 5th and 6th Vict., cap. 45, sec. 13. Mr. Cassell stated that he inserted in his works, *Cassell's Illustrated Family Paper* and the *Picture Times*, articles, papers, prints, drawings, woodcuts and engravings selected from the work *L'Illustration*, and he alleged that Mr. Stiff and Mr. Vickers, publishers of the *London Journal*, had inserted in that work prints, drawings, woodcuts, and engravings from *L'Illustration*, and that they had done this without permission, and to the injury and damage of the plaintiff. Counsel having been heard for plaintiff and defendant, the Vice-Chancellor said the questions of construction on these Copyright Acts, in connection with the facts, were much too doubtful to be decided upon a motion for an injunction, until the plaintiff had established his legal right in an action. He had grave doubts upon the 15th and 16th Vict., c. 12, sec. 7. Some questions might arise upon the order in council on the subject. There must be liberty to bring an action, and liberty to apply.

W. HENSEL, PINXT

H. BOURNE, SCULPT

MIRIAM.

FROM THE PICTURE IN THE ROYAL COLLECTION.

THE

BIRMINGHAM SCHOOL OF ART.

THE Earl of Hardwicke, as President of the school, has presided at the annual meeting in Birmingham; and is succeeded in the Presidency by Lord Ward. Mr. Cole and Mr. Redgrave attended, and both gentlemen delivered addresses: from that of Mr. Cole we extract the following passages:—

It was generally supposed that the French government did everything for the people in the matter of Art education, while our own did little or nothing; but this was far from being the case. He ventured to say there was nothing like the assistance rendered to any provincial school in France which this institution received from the government of this country and from the public of Birmingham. The French schools of Art in the provinces were entirely worked out by the persons resident in the localities, the funds being derived from the *octroi* dues levied in every town. The government, in fact, did nothing whatever for the provincial schools of France, with the exception of sending them bad pictures purchased from the exhibitions of Paris. He had not found a single instance in which a French school derived aid to the same extent as was received from government by the Birmingham school. It had been said, too, that although the government did meddle a little in the question of Art education, it did a great deal more in London than anywhere else. Now, that he conceived to be entirely a mistake. Whatever might have been the state of things at the outset, the whole tendency of the present system was to extend aid to schools throughout the provinces, as was proved by the rapid increase of schools of design. Not much more than five years ago, the number of schools did not exceed eighteen, while at present there were upwards of sixty such institutions, and there was reason for believing that this increase had mainly arisen from the course government had pursued. It had been said that the expenditure of public money for the promotion of Art was in greater proportion in the metropolis than elsewhere. The object, however, of the institution in London was to train up masters for the provincial towns, and at the present time they had the advantage of the services of three or four of these gentlemen in Birmingham.

We give Mr. Cole the full benefit of his views upon this topic: for there can be no doubt they will be much canvassed in the provinces, where it is known so much discontent prevails. They received indeed partial comment and consideration from M. W. C. Aitken, who spoke at the meeting to the following effect:—

He admitted that the same amount of care was not given to some departments of Art in France as in this country, but he must express his opinion, that if the money spent in the Art-museums of France was taken into consideration, it would be found that the assistance rendered by government in that country, was on a more liberal scale than in our own. He would ask Mr. Cole how it was, that with so little Art education in France, they still stood in the van of all that regarded Art; for even though much of French ornament might be redundant, yet take away the excess, and the French ornaments would still be far in advance of our own. When Mr. Cole spoke of the small amount of state assistance afforded to Art in France, he would ask why he did not take into consideration the support given to the Louvre, to the Hotel Cluny, to the Gobelins, and to the manufactory of Sevres? Reverting to the support of Art in England, he would remind Mr. Cole, that while the sum of 7969*l.* 9*s.* 11*d.* was expended on the Marlborough House school, the direct payments to the whole of the provincial schools, did not amount to more than 6349*l.* 13*s.* 0*d.*, of which only 476*l.* were allotted to the Birmingham school. He contended that a larger measure of assistance ought to be extended by the government to the Birmingham and the other provincial schools.

The Hon. and Rev. G. M. Yorke supported this view of the subject:—

He believed that the self-supporting system, if applied to the school at Birmingham, must be a failure. In order to meet the expenses, the fees would have to be raised, and many students would consequently be compelled to give up attending. To be self-supporting the school must be maintained entirely by the fees paid by students, and, he asked, was it possible so to increase the number of students as to raise the sum now derived from government and from voluntary contributions?

CORRESPONDENCE.

To the Editor of "THE ART-JOURNAL."

COPIES OF THE "OLD MASTERS" IN THE NATIONAL GALLERY.

SIR,—I think that the large number of copies (chiefly after the great Italian masters) in the National Gallery, must occasion regret to every true lover of Art. The following list of pictures does not include all the examples which might be enumerated:—

1. CORREGGIO (after), "Agony of our Lord in the Garden." Purchased by Mr. Angerstein, from an Italian, for 2000*l.*, upon the opinion of Sir Thomas Lawrence and Mr. West, who pronounced it to be a genuine work of the master; the original forms part of the collection at Apsley House.

2. After the same, the "Ecce Homo." This copy of the picture by Correggio, in the National Gallery, is attributed to Ludovico Carracci.

3. After the same, "Study of Heads," copied from the frescoes in the Duomo at Parma.

4. After the same, the companion to the preceding picture.

5. CLAUDE LORRAINE (after), landscape marked "Mariage d'Isaac avec Rebecca. Claudio Gel. inv., Roma, 1648," evidently placed upon the picture to suggest the idea that this work differs in composition from the very celebrated landscape by the master, entitled "La Molina," in the Doria Palace, Rome; it is, however, only a copy of that picture.

6. After the same, landscape, with three female figures, carrying weapons proper to the chase, intended probably for Diana and her attendants; this is a copy of a fine composition of the master.

7. TITIAN (after), "Venus endeavouring to detain Adonis from the Chase." This is a copy of a favourite subject with the master; the best original repetition that I have seen is that in the Royal Museum at Madrid.

8. JOHN BELLINI (after), "Virgin, Infant Saviour, and St. Joseph;" the group is completed by a figure in armour (evidently a person of distinction), who kneels in adoration before the divine infant; a little behind, at the other side of a low wall, an attendant is seen holding the nobleman's horse. This composition is erroneously called a Giorgione; it is a copy from a picture by John Bellini. I understand that it was purchased from the family of the late Mr. Woodburne, for about 600*l.*

9. GIORGIONE (after), "The Death of St. Peter the Martyr." This is a school picture, in imitation of the style of the master, by whom there was only one example in the Gallery the last time I visited it, viz., "The Concert," erroneously attributed to his pupil, Titian.

10. MICHEL ANGELO BUONAROTTI (after), "A Dream of Human Life." This great artist never made use of an oil vehicle in colouring his designs, the only authenticated easel picture by the master, "The Holy Family" (upon a circular panel), in the Tribune of the Uffizi Palace, Florence, being painted in tempera.

11. ANDREA DEL SARTO (after), "The Holy Family." This is one of the numerous copies of the master; no style is more easy to imitate than that of Del Sarto, and, consequently, copies of his works, called originals, may be seen in hundreds in various European galleries. Florence is almost the only place where this great artist can really be seen, most of his best works being there.

12. RAPHAEL SANZIO (after), "Portrait of Pope Julius II." An old copy from the Borghese Palace; the deficiency in "the keeping" is very apparent, and betrays its want of originality.

13. SEBASTIAN DEL PIOMBO (after), portraits, said to be those of the Cardinal Ippolito de' Medici, and the painter himself. The singularly unequal execution of this work indicates that it is a copy of the master. The head of the Cardinal is weak in expression and painting; on the other hand, the so-called head of the artist is considerably better, both in tone and force.

14. LUDOVICO CARRACCI (after), "Susannah with the Elders." A school picture, feeble in the expression, and the colouring too heavy for the master; it was formerly in the Orleans Gallery.

15. DOMENICHINO (after), "St. Jerome with an Angel." This copy of the master was formerly in the Aldobrandini collection; the outlines are hard, and the colouring dark and heavy. Upon my last visit to the gallery, I was surprised to find the picture entitled "Erminia and the aged Shepherd," by Domenichino (erroneously attributed to Annibale Carracci), still hung near the ceiling; this is one of the very finest works in the gallery, for which the country is indebted to the consummate taste and judgment of Mr. Buchanan, who imported it from Italy, with many other important pictures.

16. GUIDO RENI (after), "Susannah with the Elders." A school picture, and a work eminently calculated to injure the student of Art; criticism would be quite thrown away upon such a production. The composition entitled "Lot and his Daughters," which was hung upon the line, near to the "Susannah," is a work of Guido Reni, of his earlier time, when he imitated the dark powerful forms of the Naturalists; this example of the master should have been hung over the line, as it was painted for effect, and not for the purpose of being closely examined.

17. RUBENS (after), "The Holy Family." This is a production of the school, and probably painted after a design by the master; the colour is heavy, and the execution very coarse. The picture was formerly in the possession of the widow of Rubens.

Now, I think that the wall-space occupied by these inferior works would be infinitely better appropriated to genuine examples of the "old masters," more especially as the accommodation for pictures is so limited in the National Gallery.

ARTHUR VINCENT TURNER.

50, UPPER BAGGOT STREET, DUBLIN.

[We perfectly agree with our correspondent that a National Gallery ought consistently to contain only original pictures, and these the best that can by any possibility be procured; but if such cannot be obtained, then it is desirable to have the next best—good copies, painted in many instances, under the immediate eye of the master. Besides, authorities do, and will, differ upon the merits and authenticity of pictures; for example, the late Mr. Ottley considered the heads, after Correggio, to differ so much from those in the cupolas at Parma, as to suppose them to be fragments of some large work, now lost. Michael Angelo's "Dream," Dr. Waagen thinks is of the later time of Sebastian del Piombo; the Claude is generally considered to be a copy of the Doria Palace picture by one of his pupils. Ottley and Hazlitt call the "Head of Pope Julius," by Raffaele, a true picture; Mrs. Jameson attributes it to the hand of Giulio Romano, under Raffaele. Ottley and Mrs. Jameson are of opinion that the "Venus" of Titian is by that master, one of several copies he made of the picture at Naples. Mrs. Jameson is very doubtful about the "Peter the Martyr," ascribed to Giorgione. The Correggio "Agony of our Lord" is unquestionably a copy of the Apsley House picture; the "Holy Family," by Andrea del Sarto, is a bad picture, even if painted by him, which is extremely doubtful. We merely bring forward these examples to show how "doctors will differ" not only as to the merits of a picture but also as to its authenticity. Both here and on the Continent are numerous paintings in various galleries, the owners of which claim originality for their respective possessions: at the distance of time from which these pictures were painted, scarcely any of the highest authorities will presume to offer a decided opinion upon their originality, and in some instances, even as to the painters of them.—ED. A.-J.]

MARKS OF GOLD AND SILVERSMITHS.

ON perusing your number for October last, which I have just taken out of the library, I find there is an excellent and valuable article by Mr. F. W. Fairholt, on duty and hall-marks, as used at the different assay offices in the kingdom. Had I been acquainted with the writer's address, I would have written to him, pointing out one or two trifling mistakes he has made in his description of *standard* marks. He observes, "the standard mark for silver being a lion's head *erased*, the figure of Britannia." I have to observe that the *standard* mark to denote silver of the quality of 11 oz. 2 dwts. fine is a lion *passant*. The figure of Britannia, as the Act directs, is only struck on silver of *superior* quality to standard, namely, silver holding 11 oz. 10 dwts. of fine in lb. troy, and it is very seldom indeed that goods are ordered to be made of *Britannia* silver. Having held the situation of Assay Master in Sheffield for a period of 25 years, I have had the best opportunity of knowing that the figure of Britannia has not often been called for; I do not think during the above-named period I was called upon more than some six or eight times to test what is known to the trade as *Britannia* silver. The intrinsic value of *Britannia* silver is, of course, greater than that of standard, but as it is a somewhat softer metal, it is not so useful when made into goods that are in constant wear, although it retains its polish or brightness longer than standard silver does.

LEWIS CHARLES SAYLES.

SHEFFIELD.

MINOR TOPICS OF THE MONTH.

THE NATIONAL GALLERY.—The additional pictures are now in their places: the Paul Veronese (brought from the continent by Sir C. L. Eastlake) occupies the place of the Sebastian del Piombo, at the end of the great room. As to size, in comparison with that picture, the Paul Veronese is fourteen inches wider, but ten inches shorter. The subject is "The Adoration of the Magi," to which, by the addition of palatial architecture, the artist has communicated a great degree of dignity. The indications of the painter, independently of his well-known tastes in composition, are sufficiently manifest in the heads, which resemble those of his "Marriage at Cana," "Martyrdom of St. Catherine," "St. John Preaching in the Wilderness," &c., and also in the singular crispness of his draperies. The Virgin is seated on the right, holding the Child in her lap, behind her is Joseph, and near her the ass, and one or two figures in costume, too modern (always an error of Paul Veronese). One of the kings, attended by two pages, kneels before her, and the two others with attendants are behind the first, almost on the same plane. From the top of the composition a beam of light descends upon the Virgin, and a choir of cherubim is seen above. The picture is in fine condition, and must be regarded as a valuable acquisition to the collection. The bequest of Mr. Rogers consists of three pictures. The well-known "Ecce Homo," said to have been painted by Guido in six hours, but the picture looks as if the glazes had been put on after the substantial work was dry; be that as it may, it is an admirable work, already well known to the public through Strange's fine engraving. A second from the collection of Mr. Rogers is a Titian, also well known, "Christ appearing to Mary Magdalen in the Garden;" and the third is a small study of a knight in armour, by Giorgione, reminding us of the portrait of Gaston de Foix, and an extraordinary advance on the art of the time in which it was painted, when we remember its general character. The Titian and the Guido are protected by glass, and the whole of these fine works are of unquestionable value and excellence.

THE ROYAL ACADEMY.—In a recent number of the *Athenæum*, our contemporary refers to a communication from a member of the Royal Academy, complaining that "certain ancient gentlemen—who have long ceased to exhibit, and who are never seen at the board of the Academy—still hold their place on the list of the Forty; and he asks us whether it is impossible to provide a remedy for this serious evil." This is a subject on which we have frequently spoken; and we have on more than one occasion suggested the remedy which the *Athenæum* proposes; namely, that "the Academy should create a class into which it would be honourable to retire." This is the only way to get rid of a just ground of complaint on the part of men shut out from what may be considered a legitimate claim, and of a determinate adherence to a principle which tends, more than anything else, to bring disrepute on the Academy.

SOCIETY OF PAINTERS IN WATER-COLOURS.—At a general meeting of the Water-Colour Society, held February 11, for the election of candidates, Mr. James Holland was unanimously elected an associate. Mr. Holland has established for himself a high reputation by his beautiful Venetian subjects, and must be looked upon as an important acquisition to the list of water-colour painters at this institution. A second candidate was elected in the person of Mr. George Andrews, a painter of marine subjects, whose works we shall look for in the collection of the forthcoming exhibition with interest.

HIS ROYAL HIGHNESS PRINCE ALBERT commissioned the sculptor Lawlor to execute for him, in marble, the statue of "The Bather," a work that attracted much attention at the Great Exhibition of 1851, and was much admired in Paris in 1855. The work has been completed, and is now at Osborne. This commission may act as an example; it is one of a hundred cases of encouragement to "artists without

patrons," who have long suffered under "hope deferred."

PICTURE BY MURILLO.—The "Revue des Beaux Arts" and the "L'Europe Artiste" speak in very glowing terms of a picture, ascribed to Murillo, which is at present located at No. 7, Rue d'Amsterdam, Paris; the subject is the "Repentance of St. Peter." The saint is represented as an old man kneeling, his beard soft and silvery, his hands clasped in the attitude of supplication, and his eyes lifted up to heaven: he is in a sort of cavern or grotto, the darkness of which is illumined by a solitary gleam from the sky. It is said to be painted in the most brilliant manner of the great Spanish artist; but how the picture got into Paris nor where it came from we do not learn; nor have we Mr. Stirling's volumes at hand to give us any information about it, if it ever came under the notice of the historian of the Spanish School.

ARTISTS' GENERAL BENEVOLENT INSTITUTION.—We have been requested to give publicity to the following abstract from the laws of this Society relative to applications for relief, in order that correct information may be easily obtained with regard to the form in which such applications must be made, and the times at which they should be presented.—There are two classes of cases in which relief may be given to "Distressed meritorious artists, their widows, and orphans." 1st. Those which arise from ordinary circumstances of distress. 2nd. Those which are caused by sudden and unavoidable calamities. Cases of the 1st class are relieved half-yearly, in January and July. In order to enable the applicant to receive the relief then afforded, it is necessary that a statement of the circumstances of the case should be made in a letter addressed to the council; and transmitted to the Assistant-Secretary on or before the 1st of June, or the 1st of December, that they may be properly investigated. This statement must be certified by the signatures of two subscribers, one of whom must, in addition, state by letter his personal knowledge of the truth of the facts; this testimony to the correctness of the applicant's statement being relied on without personal appearance before the council being required. Relief cannot be granted to the same person twice within twelve months, unless in a case of extreme urgent distress, when special circumstances occur after the case has been considered and relieved at the half-yearly meeting.

URGENT CASES.—To meet them, enlarged powers have been given by the laws; but the most stringent rules with regard to their application have been enacted; "only such cases can be relieved as arise from sudden illness, the death of a near relative, distraint of household goods, imprisonment, fire, or other sudden and unavoidable calamities." Urgent cases must be signed by four subscribers; one of whom, as before, must certify by letter his knowledge of the truth and merits of the case, and may be brought before the council at any time in the year when properly signed and transmitted to the assistant-secretary. Those whose cases have been relieved as urgent cannot apply again within twelve months. No subscriber is entitled to sign more than six cases within the year. The following extracts show the regulations respecting the certificates which must be produced by widows and orphans:—"Every widow must transmit the certificate of her marriage and that of the burial of her husband. Orphans must produce certificates of the marriage and death of their parents, and of their own baptisms; or other satisfactory proofs of their identity. Orphans are not admissible, as such, when the age of the male exceeds 21 years, and that of the female exceeds 30 years; married females are not considered as orphans." When cases have been forwarded and received by the assistant-secretary, Mr. W. J. Roper, No. 19, Great Coram Street, Russell Square, to whom all communications must be addressed, a paper of printed questions will be sent by him to the applicants; it is indispensable that these should be fully answered. Further, it is required that in all new cases some specimen of the talent of the artist who himself, or whose widow, or orphan shall apply, must be submitted to the council, as no person can be relieved on account of distress,

unless his "WORKS HAVE BEEN GENERALLY KNOWN AND ESTEEMED BY THE PUBLIC." In conclusion, it is necessary to state that the laws are very strict in affirming—"That no artist who has embarked in speculation in trade, in bills of exchange, or transactions inconsistent with his profession, can be admitted as an applicant."

ENAMELS BY THE LATE H. P. BONE.—Among the works of Fine Art advertised for sale during the present month by Messrs. Christie & Manson, we notice a collection of more than one hundred and seventy of the beautiful enamel portraits executed by the late Mr. H. P. Bone. A large portion of these enamels consists of portraits of kings, queens, statesmen, warriors, poets, painters, and personages distinguished in history, all copied from pictures by the greatest artists or from other authentic sources; the series embraces the period from the reign of Richard II. to that of our gracious Queen. Added to these are several large enamels of fancy subjects after various painters. The collection as a whole merits the attention of the amateur, and there is little doubt of the sale being well attended, as it appears to be the last opportunity collectors will have of acquiring specimens direct from the family of the artist. Messrs. Christie & Manson also announce for sale the pictures collected by Mr. Wetherell, referred to elsewhere; the pictures and objects of *virtu*, the property of the late Col. Sibthorp and Samuel Rogers respectively; and before our Journal is in the hands of our readers Messrs. Forster & Sons will have dispersed the gallery of modern pictures collected by Mr. Birch, of Birmingham.

"THE SANDS AT RAMSGATE."—This charming picture, purchased by her Majesty, and which is unquestionably the *chef d'œuvre* of the accomplished painter, W. P. Frith, R.A., is under process of engraving by C. W. Sharpe, and will be a plate of large size. The plate has, we understand, been purchased (it is said for the sum of 4000*l.*) by the London Art-Union Society, for presentation to its subscribers at some future year.

A STATUE OF THE LATE EDWARD BAINES, of Leeds, is to be erected in his native town—a town to which his intelligence and enterprise brought so much prosperity. The commission to execute it has been given to Mr. William Behnes. There were but three competitors for the commission—Messrs. Behnes, Noble, and Milnes. The amount to be paid for the statue is 800*l.*—not a large sum.

THE SCRIPTURAL MUSEUM.—A circular has reached us of a proposal to establish a Gallery of Scriptural Illustration with the view of awakening and stimulating an interest in the study of the Scriptures. To carry out this object it is proposed to collect materials of every kind mentioned in the Bible: pictures of the scenery of Palestine, natural and mechanical productions, costumes, manuscripts, &c. The committee include many distinguished names, both lay and clerical. The "Palestine Archaeological Association" has offered its rooms at 22, Short Street, Bloomsbury, as a temporary museum, where the Rev. D. Edwards will be glad to receive any communication on the subject, as well as to receive contributions of specimens to aid in forming the museum.

THE GLASGOW ART-UNION is preparing to issue to its subscribers of the present year two very charming engravings—"The First-Born," after C. W. Cope, R.A., and "The Villa Fountain," after W. L. Leitch. We received impressions of these prints just as we were going to press, and must therefore postpone any notice of them till our next number, except to say they will effectually uphold the credit of this society for taste and discrimination in the choice of subjects to be presented to its patrons.

THE CRYSTAL PALACE COMPANY have appointed as its "general manager" James Fergusson, Esq., the author of "Palaces of Nineveh and Persepolis Restored," and of "The Illustrated Handbook of Architecture," recently published by Murray, and reviewed in the present number of the *Art-Journal*. A more useful appointment could not have been made; it is one upon which we may safely congratulate the company and the public. We feel assured that now this dying Phoenix will arise from its ashes, and be really the valuable *appanage* to Art it was expected to

be, may be, and ought to be. We trust, however, that Mr. Fergusson will begin his task by getting rid of certain encumbrances, worse than useless, by which Art-manufactures have been discouraged and impeded; shallow and arrogant pretenders, who thought they were accomplishing marvels when they extracted the golden eggs, and left the nest empty for ever. We believe that British manufactures, under judicious management, may even now be made serviceable allies; they have been hitherto disgusted—the word is not too strong—by *employés* of the company, who will, we hope, be at once removed. We need not point out to Mr. Fergusson how powerful an auxiliary to British Art-industry the Crystal Palace may be made, nor how much its best interests may be promoted, by the zealous co-operation of the manufacturers generally throughout the kingdom. For our own parts, we shall cordially aid him in the improvements he will, no doubt, very soon introduce into this establishment—which at present stands as one of the wonders of the world, out of which very little that is good has been obtained.

THE PHOTOGRAPHIC SOCIETY finding that the duties of the Secretary were greatly increasing, and seeing the importance of rendering its journal yet more useful, resolved on appointing a paid secretary and editor. There were forty-four applications for the office, all of unusual excellence. The council, after several meetings, elected the Rev. Mr. Major, of King's College, and into the hands of that gentleman the business of the society and the editorship of the journal is now committed.

HOSPITAL FOR CONSUMPTION.—The Committee of Management of the Hospital for Consumption purpose holding a Bazaar in the month of June next, to increase the fund for carrying on this national and now extensive charity—the usefulness of which has been recently increased by accommodation for 130 additional patients, and the opening of the Sanatorium at Bourne-mouth for the reception of convalescents, a branch of the Institution which cannot fail to prove a most valuable auxiliary to the charity. Desirous as we have always been to lend our aid to forward the success of this well-conducted hospital, we gladly direct the attention of our readers to the proposed bazaar, and solicit, on behalf of the Committee, contributions of such articles as are suited to the object: all contributions should be sent to the Hospital at Brompton, where they will be most thankfully received.

CHROMOLITHOGRAPHY.—At Messrs. Rowneys' in Rathbone Place are exhibited some of the most successful imitations of water-colour drawings we have yet seen. They approach more nearly to the spirit of the brush than anything we have observed in this description of Art, the texture of the stone being almost superseded by the successful imposition of the colour; for the less the impress of the stone is observed the more nearly will the imitation approach the freshness of the original. One of the remarkable features of the success of these fac-similes is a representation of the texture of the paper and the unequal manner in which the colour sometimes settles on the paper. Since our last notice many additions have been made to the exhibition, and it must be observed that these additions exhibit marked improvement. "The Bridge at Tours," a chromolithograph after Turner, from a drawing in the possession of R. C. Vivian, Esq., is an admirable example of minute imitation—the subject itself is original and striking in its form—the left section being occupied by the picturesque and broken arches of the bridge, beyond which the eye is led to distant architecture. The original drawing has been very highly finished, and this careful manipulation has been very happily met by a succession of stones which have communicated a variety of tint very like what we are accustomed to see in Turner. We have noticed in a former article the beautifully spirited imitations of Cattermole's two subjects from Macbeth; Callow's "Frankfort," and "Cologne;" works after Prout, &c., &c. A "Street in Verona," by Bentley, a drawing made shortly before the death of the artist, is a work of much excellence; clear and sparkling in the lights, but somewhat less felicitous in the shaded passages, because perhaps chromolithography does

not realise the depth and transparency obtained by washing. The series is numerous and interesting, and some of the original drawings may be compared with the fac-similes in attestation of the truth of the latter. "Windsor Castle" after Pyne, "Fowey Castle" after Jackson, "Dunne Castle," J. D. Harding, and others after Copley Fielding, T. Rowbotham, T. M. Richardson, &c., &c., are all brilliant examples of this art, which we really think is carried to a degree of perfection inasmuch as almost to rival original drawings in all their best features.

MADAME GOLDSCHMIDT has announced her intention to give a concert at Exeter Hall on Tuesday, the 11th of March, the proceeds of which are to be contributed to the NIGHTINGALE FUND. It will be remembered that some four months ago we announced such intention on the part of this accomplished and most estimable lady. There are matters connected with this graceful act which, if we were permitted to explain them, would augment its interest and value. The public will receive the announcement with peculiar pleasure: it is the homage of one great and good woman to another: the contribution will be, no doubt, very large: and, hereafter, Madame Goldschmidt will look upon "The Institute for Nurses" as she must often look upon "The Hospital for Consumption," as in a great degree her work, for by her generous efforts immense benefits will be conferred upon thousands.

MESSRS. CHRISTIE & MANSON have commenced their season of picture-sales; a reference to our advertising columns will show that several are in progress. We have always borne, and shall rejoice to bear, testimony to the high character which this establishment has so long sustained: no one has ever questioned their fair dealing: they cautiously and scrupulously avoid lending their name to aught that will not bear a close inspection: and where wrongs have been committed under their sanction, they have been the first to cause inquiry, and to make amends. The natural result has been to secure for them an amount of confidence which certainly no other auctioneers enjoy. One of the "approaching sales" to which at this moment we would direct attention is that of the collection of Mr. Wethered, which consists of about fifty pictures, the productions of modern British artists, together with several bronzes and objects of *verru*. The pictures are all well known, and of unquestionably high value. Mr. Wethered is one of those persons in trade who, having had capital at his command, some taste, and abundant opportunities, have availed themselves of these advantages to obtain the best works of the best painters. Generally, as in this instance, they are afterwards distributed, being, indeed, often collected with an express view to distribution. But the amateur is thus supplied with valuable chances: he can see "aforehand" that which he inclines to possess: and if he is called upon (as, no doubt, he always is) to pay a large premium upon the original purchase, he has at all events "a choice," and can secure that which he covets. The pictures of Mr. Wethered will, we imagine, be objects of warm competition: there are no fewer than twenty-three paintings by Etty, some of them being his more remarkable productions. Of the remainder, there are works by Lee, Stanfield, Collins, E. M. Ward, Müller, T. S. Cooper, Linnell, Holland, and D. Roberts.

SHIP-BUILDING.—A novelty enormously in advance of anything seen before in the Art of Ship-Building is now in course of construction at Scott Russell's Wharf, Blackwall. A vessel is here building of the enormous length of 683 feet, its depth being 69 feet, and capable of carrying 38,000 tons. It is entirely constructed of iron, and carries eight boilers, each as large as a single-room cottage. In looking at this erection, we seem to be inspecting some great barrack or public building on the banks of the Thames, rather than a ship, which is destined to outstrip in speed all hitherto constructed: it is a wonderful work; and one which seems to realise the ancient tales of ship-building in classic days when gardens and palaces were stationed on deck; in this instance there would be no difficulty in getting up a race, the course encircling the deck.

REVIEWS.

THE ELEMENTS OF PICTURESQUE SCENERY; OR, STUDIES OF NATURE MADE IN TRAVEL, WITH A VIEW TO IMPROVEMENT IN LANDSCAPE PAINTING. By H. R. TWINING. Vol. II. Published by CHAPMAN & HALL. London.

It is about three years since the first volume of Mr. Twining's "Elements of Picturesque Scenery" passed under our notice: in it the author's remarks referred to all those *solid* objects in nature which attract vision—rocks, hills, trees, and what-ever belongs to, or is implanted on, the surface of the earth; his second volume relates to those objects, or rather effects, which are connected with the atmosphere, and with its abundantly pervading influence, light; or, in other words, it is a treatise on aerial perspective, that peculiar characteristic of good landscape-painting which so few artists comparatively know how to reach, and the absence of which, as a consequence, spoils many a picture in every other respect highly meritorious. The failure arises from ignorance of, or inattention to, the phenomena of nature; the solid objects which the painter sees are in their forms and picturesque appearance too often of far more importance to him than the effect produced on them by atmospheric colouring, and hence one of the most beautiful qualities of the landscape becomes only a matter of secondary consideration. Mr. Twining is of opinion that the "old masters generally, when representing distant scenery, have shown themselves not only incapable of rendering those more subtle effects which are due to accidental and transient changes, but they are even very deficient in simply accounting for the due and progressive influence of the atmosphere on the tints of retiring objects. You may sometimes observe in the Dutch masters, especially Breughel, transitions from green or brown, to blue, so sudden and abrupt, that in nature they could not occur under the circumstances which are implied in the picture. Even Claude, whose aerial gradation is so beautifully maintained in his pictures of sea-ports, when the subject is near and the atmosphere hazy, fails in giving the true aerial distance to his mountains in an extensive prospect during clear weather. Some of his distant hills appear crude and heavy, and occasionally may be seen a grey, which approaches too near to white to be natural under the particular circumstances of the scene—unless it were intended for snow, which does not at all appear to be the case. Cuyp is almost the only painter of that period who appears generally consistent; but then his evening glow is nearly the same in all his pictures: there is no attempt at diversity of effect."

The treatise is divided into four parts respectively, entitled—The Atmosphere, Phases of the Day, Clouds, Winds and Storms; and each of these is subdivided into descriptive subjects, systematically arranged; thus the whole phenomena of aerial nature in their relation to the earth and those things which are of it are brought under discussion. It will be evident that a subject so treated can only, in the restricted space to which our "Review" columns are limited, be spoken of generally; we have no room for extracts, nor do we find any statements in the book that are open to argument; on the contrary, Mr. Twining seems to have studied his subject closely and truthfully; his observations and experiences are embodied in language as free from dryness and technicalities as their nature admits of, so that his pages will be found as interesting to the general reader as they are valuable to the landscape-painter, to whom the investigation of the science of nature is of the highest importance when he desires to apply it to this Art; and, as the author rightly observes—"Modern painters have a theme much more difficult before them than that concerning which the old masters have left them practical examples; since, in order to satisfy the prevailing demand for diversity, they are frequently compelled to broach those effects of nature which formerly would have been set aside as being placed almost without the limits to which Art might be expected to attain." This is no less true than it is complimentary to modern Art, for where among the greatest of the old painters shall we find any attempt to represent on canvas such natural appearances as Turner, Danby, and Martin have given us? men who saw more in the heavens than masses of rolling clouds or the quiet glow of a summer's sunset. We would never advocate a style of painting that chooses the extraordinary phenomena of nature, but we do like to have our thoughts attracted to something which indicates that the painter can see with a poet's eye, and trace with a poet's hand, some of the beauty and grandeur which nature, in her fantastic moods, so to speak, spreads over the

landscape;—that, while there is but One whose prerogative it is to

"Ride on the whirlwind and direct the storm,"

yet He has endowed his creatures with the intelligence to admire and wonder at his creating powers, and with genius that enables them to imitate—even at a distance—what He permits us to behold, and find pleasure in.

HARVEST IN THE HIGHLANDS. Engraved by J. T. WILLMORE, A.R.A., from the Picture by SIR EDWIN LANDSEER, R.A., and SIR A. W. CALLEOTT, R.A. Published by the Art-Union of London.

Whatever be the cause, whether the success of a rival institution, or a more enterprising and intelligent spirit than we have been accustomed to see influencing the Council of the Art-Union, it is quite certain that within the last four or five years, with one exception, the engravings it has issued have been of a very superior class to those received by the subscribers on preceding occasions. The "Harvest in the Highlands" is for the subscribers of the current year, and we shall be much mistaken if it does not tend to augment considerably the annual subscriptions. The original picture, the joint production of two great names—among the greatest in their respective department, of any age or country—we are well acquainted with, though it has long been hidden from the public eye, in the country residence of Mr. S. Cartwright, F.R.S., near Tunbridge, Kent, where we had the pleasure of seeing it a few years since. We know that more than one eminent publishing firm had desired to engrave the work, and we have heard that no less than 1000*l.* or 1200*l.* had been declined by its owner for permission to use the picture for such a purpose. That, however, which was refused to private speculation has been granted to a society whose object is to create a love of Art among the thousands. For many reasons, then, we rejoice to see this beautiful composition in the hands of the public by the aid of Mr. Willmore's *burin*. The picture is one of those long narrow canvases which Calleott frequently used, and Landseer now does occasionally. From the left of the composition a lofty range of mountains stretches away into the extreme distance; a considerable portion of these is concealed by clouds and vapours, for a shower has just passed over the distant landscape, which is in deep shadow, except where a rainbow appears to spring from its surface; the long level plain between this and the foreground is more or less lighted up with gleams of sunshine. In the foreground on the left, and leading into the centre of the picture, is the corn, partly standing, partly gathered into sheaves; nor does it seem that the owner of the produce is very anxious to have it garnered, for the labourers are few, one elderly woman with a kind of rake in her hand, and a young girl holding a sickle, and with a small sheaf under her arm: the latter is conversing with a group of boys, one of whom is keeping back a collie dog whose attention is directed to a number of deerstalkers coming up in the distance laden with their spoil. Between the old woman and the group of children is a cart, laden with corn; it is drawn by a rough-looking animal with a foal by its side, and to the right of the group, among a mass of granite blocks, and a calf tethered, a goat and its kids; all these figures are, of course, by Landseer. We have entered thus minutely into the composition of the picture because it is a work very little known. The engraving will bear comparison with the best issued by any Art-Union Society; there are parts of it which would be benefited by a little more of that refinement which Mr. Willmore knows so well how to employ; but the general character of the print is delicate yet effective. The clouds, the mountains, and the distances are charmingly rendered, both with regard to texture and to atmospheric effect, and the foreground exhibits much free and masterly handling of the graver.

THE VOYAGE OF LIFE. Engraved by J. SMILLIE, from pictures of T. COLE. Proprietor and publisher, the REV. GORHAM D. ABBOTT, Spingle Institute, New York.

We were called upon to produce evidence of the progress of Art in America—good Art, too, though of a peculiar class—we should point to three engravings recently received from New York; another is to follow, which, at present, is not quite ready: the series, when complete, illustrates the "Voyage of Life," as sung by a hundred poets, great and small. The prints before us represent respectively "Childhood," "Youth," and "Manhood," from pictures by T. Cole, whom the Americans regard—and not without sufficient

reason—as one of their best landscape-painters. Mr. Cole is English by birth, parentage, and, to a great extent, by Art-education, we believe: he was taken to the States when very young, and, except his visits to Europe for improvement, has always resided there, and, of course, is regarded as an American citizen. These compositions afford evidence of a most poetic mind, of one whose inspirations have been nursed on the banks of the mighty Ohio, and amid the giant forests of the artist's adopted country; the rocks, trees, plants, and flowers belong to the New World, though many appear of primeval growth;—all is essentially American in its vastness and in its grandeur. In the first picture of the series, "Childhood," a boat has just emerged from a dark cavern in the midst of a mass of rocks, through which runs a stream; the little vessel is richly sculptured; the figure-head is a young female with wings, and bearing an hour-glass in her hand: in the boat is the Child playing with wreaths of flowers; a radiated figure is at the helm, as its directing angel; the banks of the stream are covered with gorgeous flowers and magnificent plants, which glitter in the morning sun, before whose brightness masses of heavy clouds are rolling away: there is a fine feeling for the beauty of nature in this composition. In the second, "Youth," the landscape is an open scene; the river has widened its banks, the boat is hurrying onwards, now steered by the youth, but the guardian angel is by the river-side, pointing the voyager towards a magnificent palace dimly outlined in the sky: noble groups of trees appear in the foreground of the picture; but the craggy forms of the hills in the middle distance are not agreeable; they mar the repose of the scene, as suggesting the idea of some great convulsion of nature. "Manhood" comes next, reminding us of John Martin in the unearthly grandeur of the scene: it is wild and black; the rocks and trees are riven, and "a horrible tempest is stirred up round about;" hideous diabolical forms are half concealed among the clouds—tempters with the dagger, the cup of poison, for the man has let go the rudder-bands, and is drifting rapidly towards a whirlpool, that threatens to swallow him up: but his good angel has not totally deserted him; through a small bright opening in the clouds she still watches him; and there is no doubt, when the fourth plate makes its appearance, we shall find she has conducted him safely through the perils of his journey.

These works certainly merit much commendation; they evidence, as we have already remarked, a highly poetical conception, and, generally, it is carried out most successfully; there is nothing commonplace in them, nor is Mr. Cole guilty of plagiarisms; his ideas are his own; and their originality, gathered from the natural sources by which he is surrounded, invest them with a freshness and a charm which cannot but be attractive to an eye accustomed to European landscapes. The engravings are of large size, and for vigour, freedom, and clearness, the work of Mr. Smillie will bear a favourable comparison with some of the best examples done on this side the Atlantic: they are, we understand, his own work entirely, the assistance of which in England engravers so frequently avail themselves, Mr. Smillie was either unwilling or unable to procure. The series of plates is, we should consider, the most important publication ever attempted in America: the character of the work, no less than the way in which it is produced, must do a great deal towards improving the tastes and elevating the minds of the people for whom it is more especially intended. We are truly glad to see American Art in so advanced a state; and must congratulate the reverend gentleman whose name appears on the prints as publisher and proprietor on the successful completion of his costly undertaking thus far. The pictures are in his possession, and he has caused them to be engraved, far less from any desire to derive pecuniary benefit from the work, than in the hope the engravings will conduce to the intellectual benefit of his fellow-countrymen.

SPECIMENS OF TILE PAVEMENT IN CHERTSEY ABBEY. By HENRY SHAW, F.S.A. Published by Subscription.

From the site of the once famous Benedictine Abbey of Chertsey, in Surrey, have been dug up within the last few years, large quantities of richly decorated encaustic tiles, on which in ages long ago "the sandal'd monk," and the bare-footed brother doing penance, trod softly; many of these tiles are now preserved in the local museum and elsewhere, and from them Mr. Shaw, the archaeologist, has copied and published. They are of the date of the thirteenth century, and are more or less elaborate in design, the colours used invariably, so far as Mr. Shaw's examples show us, being yellow orna-

ments on a red or brown ground. Three of the specimens have curious devices in their centre; one a figure, whom we presume to be St. Peter from his holding an enormous key in his hand—the Abbey of Chertsey was dedicated by King Edgar to this Apostle—stands in a gateway of a castle; in the centre of another is a figure in a boat, into which another figure is attempting to enter by means of a ladder raised against the prow; we should imagine this device is intended for a representation of Peter walking on the sea; the figure in the boat lifts up his hand as if to chide the Apostle for his unbelief. In the third a youth is playing the harp to a crowned head, possibly meant for David and Saul: both figures are seated together on a kind of couch. Modern manufacturers of encaustic tiles will do well to refer to Mr. Shaw's work for designs.

ZAHMES GEFLUGEL. Gezeichnet von E. HASSE, in Holzschnitt ausgeführt von HUGO BÜRKNER. Dresden, bei ERNST ARNOLD.

DOMESTIC FOWL. Drawn by E. HASSE, the Woodcuts by HUGO BÜRKNER.

We had, some time ago, in a biography of H. Bürkner, occasion to notice his proficiency in the art of wood-engraving, and the specimens of his skill which we gave, must, we think, have fully justified our praise. The four large plates before us display a mastery of execution which must delight every admirer of legitimate Art. The first plate shows the common "Cock" in all his strutting pride and glory, a perfect representation of Dryden's chanticleer; the bird is full fourteen inches high; it will be seen, therefore, that scope is afforded for the boldest haudling. The "Hen" follows with her chickens. Then come "Ducks" and "Geese." Nothing that Herring ever painted has, in its way, more character and expression than will be found in these studies from the life. The drawings may be used for copies, and as specimens of what wood-cutting is capable, they deserve attention. They cannot fail to add to Mr. Bürkner's reputation.

MACHINERY OF THE "ARABIA" AND "LA PLATA." Engraved by J. PETTICOLIN and G. B. SMITH, from Drawings by D. KIRKCALDY. Published by W. MACKENZIE, Edinburgh, Glasgow, and London.

It is rarely we are called upon to notice such a work as this; and we presume it is almost as rare for any large manufacturing firm to incur the cost of producing such a work; but then Messrs. R. Napier & Sons are not ordinary engineers, and the machinery of the noble steamships which traverse the Atlantic are not ordinary manufactures; and therefore we can easily see reasons for such a publication. We cannot enter into the mechanical merits of these plates, but we can wonder at the magnitude of the machinery, its complicated parts, so beautifully fitted and adapted to each other, and at the science which contrives the whole, and puts it into working order: the merit of this is due to the constructor, Mr. Robert Napier. The engravings are admirably executed from Mr. Kirkcaldy's drawings, who had a medal awarded to him at the Paris Exposition for them and others exhibited by his employers. It is only when the eye takes in, as it does here, the whole compass of these gigantic steam-engines, that one can form a correct estimate of the mind that creates, and the ingenuity that executes: surely, to borrow an Iibernicism, this is the "golden age of iron-work," in its adaptation to machinery.

HERE AND THERE IN PORTUGAL. NOTES OF THE PRESENT AND THE PAST. By HUGH OWEN. With Illustrations after Photographs. Published by BELL & DALDY, London.

A more pleasant, gossiping volume of travels than this it has rarely been our fortune to fall in with: the talk, too, is of a country little visited by tourists; this adds to its interest, for one gets terribly tired with the multitude of books written about places where Englishmen "most do congregate." Mr. Owen does not pretend to tell of more than he saw, but he seems to have seen a great deal of the people, their habits, manners, customs, and condition at the present time: these are the chief topics of the notes he has jotted down, in considerable variety and with much intelligent observation. His is a record of facts, not of theories, or fancies, or statistics, or pictorial descriptions, the usual materials of travel-writers; and it is the absence of these which imparts a freshness and an interest to his narrative about Portugal.

THE ART-JOURNAL.

LONDON, APRIL 1, 1856.

NOMENCLATURE
OF PICTORIAL ART.*

BY J. B. PYNE.

THE BEAU-IDEAL.

F this subject be approached through the web of contradictory opinion, which entangles rather than illustrates it, or through those more subtle complicated disquisitions which attempt

to obliterate all primary and common-sense appreciation of things in the gloom of a logical negation, it were hopeless, in any limited space, to attempt a disentanglement.

For the Art-loving world it is unfortunate, and for the Art-student more so, that the beau-ideal should remain a vexed question. The world, in general, is the more fortunate of the two, for throwing aside doubt and disquisition, and refusing to complicate a subject of apparently the utmost simplicity, it at once saves its time, avoids trouble, and enjoys its beauty; lives in happiness and dies under the full persuasion that though deformity may occasionally obtrude itself on the attention, beauty may always be had for the searching, and whose beau-ideal is a reality exactly commensurate with its experience.

With the student it is quite otherwise. His aspirations push him continually onwards. His experience should extend to the ultimate experience, and his productions be transcendental.

If the world is perfectly agreed as to the existence of beauty, and its climax in the beau-ideal, readily assenting to it when discoverable in works, and only disputing as to its degree, it is sufficient. Less knowledge would not decrease its happiness, and more might not augment it. The enthusiastic student however may not in commencing his artistic career be satisfied with this state of things. They are not sufficient for his purpose, which is ever onward, deriving sustenance on his route from all sources; at first indiscriminately and wildly, and followed by many derangements of his mental digestion.

There is then much unassimilable reading matter to be waded through on the subject in hand; sufficient, indeed, to try the strength of the finest mental digestion, to sverve a taste of originally pure and correct bias, and warp a judgment from its first fresh healthy and vigorous conclusions.

One theory contends for the actual separate existence in the eternal order of things of such qualities as beauty and deformity.

Another denies altogether the actual

existence of beauty and deformity as distinct and separate qualities, and would attribute the perception of them to association alone.

A third theory—a kind of “*juste milieu*” between the irreconcilable antagonism of the first two—admitting the actual separate existence of beauty, would account for its presence by an universally accompanying fitness: a fitness of parts with a whole, and a whole with external conditions.

There may possibly be other links or grades of opinion serving to bring more closely together these three great salient points, but as they may not be able to extend the subject on either one side or the other, so they could not open up new ground for reflection; but as they are, must be considered to embrace the whole field of opinion upon which the war about beauty has been and will have to be contested.

Nor should a man be vain enough to imagine that with a dash of the pen or the best arranged discourse he might be able to settle the question. If it were an affair of numbers, weight, or measurement, of colour, of force, of solidity or liquidity, it had been settled long ago. If it were a matter of commercial or productive import, the want of which should be felt by the million, with a profit of twopence-halfpenny a yard or a penny a pound, obscurity had vanished almost before it were felt to be obscure. But as it is a matter wide a-field of these things, felt only as a want by the few instead of the millions, in an age far in advance of the age of animal wants and the actual necessities, it must still wait its solution. We have arrived at the age of luxury, it must perhaps wait its final solution in an age of refinement.

It may be questioned, then, “why write,” “why discourse,” and it can only be answered that to do both one and the other are instances of the purest natural egotism, in which the speaker or writer would register himself in his opinions; addressing himself virtually to his peers though ostensibly to the whole world. He does so by way of advertisement for the discovery of a mental relative with whom he may well sift a subject in which both may be equally interested. And these stray lines are thrown together as much to arrive at self-assurance as to the soundness of his own views as with any idea of being able to seriously influence any preconceived theory of his fellows.

There are many considerations which involve the improbability that the principles connected with beauty and the beau-ideal will yet be solved, or if solved be generally acknowledged.

Some works possessing the beau-ideal to a great extent have however been produced, and many more still which have an undisputed title to the beautiful, both intensely appreciated; the one attributed to fine taste and knowledge, and the other to a divine inspiration: and the latter flattering though vague and unsubstantial reception will continue to be given to all works of rare elevation of thought, though they may be—like all the present known instances of the beau-ideal—derivable entirely from a high type of Nature itself.

The position of this beau-ideal, standing isolated at the very head of human form, and illustrating what may be considered to be the Creator's first design as to its highest possibilities, throws it far in advance of the wants that agitate the mind of a people, and hence the obscurity that involves the subject, the wonder at its occasional production, and the flattering inapplicability of the language resorted to in its description.

But before losing sight of the subject in

premature digression, though without entering into a full disquisition, for which there is no space, it were well to canvas slightly those opinions, already stated as dividing the attention of the student regarding the material separate existence of beauty and deformity. As without this material existence the fight is comparatively for a shadow, but with it, for a glorious reality, worthy alike the consideration of the Art-lover, the statesman, and the philosopher.

To clear the ground of all rubbish and impediments that obscure a fair view of the object in question, and to render it open to the gradual advance of common sense and simple reason, it will be necessary at once to discard from the mind every notion of those sublime logical absurdities, those curiosities in the perversion of language that would deny existence to those things of whose presence every sense vouchsafed to man attests the actual identity; to receive at once those things as real, to whose reality the senses testify.

Thus, then, I think it necessary at once to accept the first proposition mentioned, which asserts “the actual separate existence in the eternal order of things, of the qualities of beauty and deformity,” taking deformity in the sense of the ugly, and in which sense it will always be used in this paper. If there be allowed any point of dispute on such a subject, let it merely be the “why such beauty,” and the “wherefore such deformity,” and not as to the actuality of either one or the other. Without this fair starting-post the race is for nothing, the runners fools, A No. 1. The umpires humbugs, with themselves only for a course, and a sham triumph of emptiness. Asserting broadly what is beauty, under the shelter of a definition of the character of the extinct school, it is that which is furthest removed from what is universally allowed to be deformity; and *vice versa* with deformity. But there is no need of such a definition except by way of general summary, its constituents being tolerably well determined in the general mind.

In form it would be defined to be the greatest possible amount of variety dominated by harmony, which again would be defined as relationship and opposition with subordination. As regards its variety, not that sudden hectic and wild dissimilarity of parts that would contain the longest with the shortest, the roundest with the flattest, the most pointed with the most indented, but a variety founded on affinities, the culminating illustration of which may nowhere be found in an equal degree with the form of Man himself, who displays, both in structure and movement, a category of all the varieties of form distributed, in a less degree, through all other objects in nature.

The best collateral evidence of this constituency of beauty may be had in the comparison of some of these other less beautifully developed objects in nature, objects of a less complicated structure with a less number of parts; as constituting, by their greater simplicity, a more easily to be determined character.

The second theory, which “denies altogether the actual separate existence of beauty and deformity as distinct and separate qualities, and would attribute their perception to association alone,” can hardly be disposed of in so summary a manner as the first. An artist cannot do so; his business is with life and reality, and it is as much as may be expected of him if, in the liberality of his temperament, he may be able to attribute to fair and just motives the attempt to disintegrate from the actualities of nature,

* Continued from p. 199, vol. for 1855.

some of its noblest and most beautiful identities. It is as much as may be required of him if, in due consideration for the egotism of a professional obliquity, he excuse a man whose business may be writing alone (and which business of writing allows of an impalpable subject for illustration), for a proneness to make most things impalpable, ideal and associative, but he cannot be expected to go further, nor pin his faith to so slender a tissue. Neither need he throw down his familiar instruments, whether they be pencil or chisel, and assume the stranger pen to confute theories which would assume to weaken the appeals of his pursuit to the human mind. He may cut down such theories with the chisel, or paint them out with the brush. He may perhaps do either one or the other more easily than write them down. An artist would, by way of argument, most readily allow of the infancy of Art altogether, from its noblest achievements to its humblest. And if logical precision or cunning be capable in the present state of the science of ignoring an universally acknowledged identity, it is rather a proof of the possible infancy also of logic itself, or of language, than of the destruction of such an identity, which must still remain an identity intact in the mind, from a more than faith superinduced by the senses. In the present instance such a more than faith does not in any way necessitate the entire absence of association, which may have its full play in augmenting a secondary class of beauty to the same level with one of a first class. But it is submitted that association alone can no more create a first class of beauty, any more than the smell of a kitchen may be able to realise a first-class dinner, or the effects of one.

But throwing aside this mischievous misuse of logic, the science by itself may be allowed to be perfect; and if limited in its application to subjects of utility, one of the utmost importance to be preserved in its utmost integrity. Logic however has its limits as clearly marked as any other science; for instance, it is not strictly of an initiative character, and follows rather than leads. It cannot go far enough to grasp with first causes, but must wait for previously acquired knowledge upon which to work out its searching precision: its province is in secondary causes, and is powerless when attempted to be carried further. Its only further power is one of a more curious and negative class than otherwise. It is capable of curbing the too arrogant and speculative mind, and defying it to prove to a demonstration that of which it has not previously acquired the true knowledge, and in this regard has its uses.

The human mind, however, being of an essentially initiative character, will no more be content to rest satisfied under the knowledge only of secondary causes, than a colony may be content to rest satisfied with anything less than the possession of the whole of a continent.

Under the far-strained and perverted powers of logic, one is denied the right of proving the existence of man. Man's existence a negation, beauty resolves itself into a nonentity, and there remains you may say—in an equally fair mode of reasoning—nothing but the logician himself accompanied by his perversity. But the logician himself thus remaining is by the process identified, and becomes a nucleus around which other existences may establish themselves, and amongst them perhaps even beauty.

Logic is the arithmetic of language, and a very complete one; the accounts in which it is used are kept by double entry, and

bear a balance on their face of *all we know*; but at the same time it does not represent the *all we have*, for which we are indebted to a more comprehensive and liberal process. The more purely initiative intellect of the world, in the use of this more comprehensive process, is at work far away beyond the trodden paths, labouring with untired courage and daring on the very verge of that darkened abyss which separates the known from the unknown. One ventures into space and brings back a star, another acquires a continent, a third an art, the last of which importations, in its present form, that of photography, is enriching and entertaining the world with pictures which produced in a single instant, require the strongest microscopic powers to thoroughly develope, and any amount of time to thoroughly examine.

Form itself appreciated under the terms of the second theory denying "the actual separate existence of beauty and deformity," would be an instance of the reproduction of that dark abyss which separates the known from the unknown, the dispersal of which is grandly shadowed forth as the first act of Omnipotent creation; and a mind incapable of seeing throughout the whole universe of form, anything of sufficient intelligence to rank itself at once at the head of all such antagonistic qualities, as grandeur, simplicity; beauty, deformity; strength, weakness; harmony and discord; must be in itself a stagnant well of darkness, of doubt, and of deformity: one constituted on the experience of four senses, with the crowning glory of vision in abeyance.

In the face of that high and universal presence of intelligent form, rounding as it does the infinite separate existences in nature; as distinct in its minute as in its most colossal modes; it is impossible to force the mind by any act of reason to ignore its intentionality, or to doubt that amongst it—accompanied by proportion—a true beauty exists with out the aid of association or egotism, which may—by way of admission only—render an object more beautiful to one individual than another; and even more beautiful at one time than another: the last case entirely depending on the varying degrees of activity or supineness of the same reflective mind at different times.

It should not be a difficult matter in answer to this beauty-denouncing theory, to prove the intelligent character of form by a slight survey of its universality.

The first act of creation was in the substitution of form for chaos; and all its subsequent acts are the additions of so many new forms; proportion itself being nothing more than subdivisive separations of form by other forms, components of the first matter of form.

For as far as the mind is able to possess itself of the knowledge of things as they are, does it become the more impossible to imagine that the Creator—in commencing with form—did not begin with the most essential quality of things, and that had creation—as regards the external world—gone no further, man would not have had to complain of any essential wants. This has been so frequently and so distinctly felt that we frequently hear the opinion, that the unessential colour is in effect a proof that the great aim of creation was that of producing the greatest possible amount of variety. This, if to any extent true, appears to be a merely putting the cart before the horse. The self-evident intent of creation would perhaps be more truly given, by stating that creation, in adjusting an infinite number of things to an infinite number of

ends and uses, has projected an infinite number of forms admirably adapted to them, and that hence has occurred the infinite variety; so full in itself, that more than satisfying man's wants and expectations, leaves him at a loss to discover the motive for such an apparent waste of form and colour, and leads him on a wrong scent in accounting for them.

We find, also, an admirable harmony and genial agreement between the Mosaic account of creation, and what may be called the revelation of geology in the order of that creation. We first find the acts of creation first merging into light and intelligence on the grandest scale, such as in the great globe itself indicated as a mass of waters. "*And the earth was without form and void; and darkness was upon the face of the deep. And the spirit of God moved upon the face of the waters.*"

After the rising of the land above the surface of this profound solitude of water, we find creation occupied in calling into existence the simplest and less complicated forms of animal life: proceeding gradually through the more complicated winged tribes, the vegetable, the terrestrial animal, and only, as an ultimate act, producing Man with a completeness and variety such as to offer in itself alone a fair constructive balance to all the rest of creation besides.

The gift of the whole of this previous creation to man is more than an indication of the perfect equilibrium existing between the two. And as fair an indication that, being presented with an even balance-sheet on entering life in the world, he may be required to produce as fair a balance upon leaving it.

If it be still possible to doubt that amongst this infinity of varying form there is included an ultimate beauty, and that such beauty has always, amongst other qualities, been present in the scheme of the Creator, it is only necessary to contemplate the added infinite variety of colour to turn the mind from its doubt, and permanently fasten upon it the more healthy conviction that beauty reigns in different degrees at, and as the head of every definite class of things; and that by comparing classes, and placing that which includes Man at the head of all others, *the highest possibilities of the human form realise in its ultimate fulness an instance of the beau-ideal.*

While feeling that every class is capable of maintaining beauty at the head, it is easy to allow that it permits deformity at the base. It would appear that the very nature of things insists on this conclusion. The infinite variety includes infinite difference and separation. This difference and separation may not be utility and inutility, as universal fitness and utility are more conspicuously clear and defined in the works of nature than any other quality; that is, they are *universal*, as they never vary, but attach equally to things beautiful as to things deformed. We say a thing must either be more or less useful, or more or less ornamental. As this infinite variety and difference does not affect the useful things are all useful, but more or less ornamental, and hence *beauty and deformity.*

It is inadmissible to speak of the works of Nature upon the same terms as of the works of Man. Of the latter, it may be said that some are neither useful nor ornamental; and I should therefore say of that theory which would dethrone beauty in the world and place her at alms under the varying caprice of a well-informed or ill-informed associativeness, that it is neither useful nor ornamental; but most gratuitously mischievous, as calculated to retain a base

mind in its original coldness, and as offering some plausibly philosophic grounds for lowering the generous and grateful warmth of a great one. Though not coming under the strict definition of beautiful, as being imperceptible to vision, there are other qualities applicable by other senses not entirely irrelevant, as thus belonging to the beneficent side of the nature, and have consequently a certain amount of affinity with the beautiful. Textural smoothness, elasticity, softness, and warmth, have all their value in heightening the impression of an appreciated beauty.

Reasoning on the constitution of the mind, and the several causes contributing more immediately to the development of its various sentiments, feelings, and passion, we find that it would never ascend to so high a one as love without the presence of beauty. And by analogy, on the general scheme of creation, in which nothing is left undone which tends to high purpose, we must admit at once that the world is wondrously full of beauty. Some will say that certain minds are so full of love that they include the whole world as the object of this passion. But it would, perhaps, be safer, in this instance, to call this passion feeling, and pronounce this feeling benevolence, as, if tested severely, it would be found to fall far short of that passion which absorbs all others in its glow, as the sun absorbs all other modes of light in its effulgence. It will be therefore safe to conclude that, as creation had so universally elaborated the susceptibility to this passion, it has been no less liberal in the distribution of its most essential aliment—under the numerous forms of beauty—for its eternal sustenance.

Thus the mind, while instinctively but unconsciously weighing the different gifts of creation, will be found as unresistingly possessed by the following feelings: gradually ascending with the gradually extending benefits; commencing with the simplest contentment in return for the mere privilege of life and wherewithal to live, and grandly terminating in veneration of the Creator for that extension of the boon in which the mind finds itself still better provided for than the body.

Thus, uncivilised man in the possession of the merely necessary, remains *contented*,—with the useful, he becomes *grateful*; the arts, science, and luxury excite his *admiration*; beauty and refinement, his *love*; and under a true appreciation of the essence of Deity, in which his own mind expands with his gradually expanding knowledge, his soul fuses in *veneration*.*

NATIONAL PORTRAIT GALLERY.

On the evening of March 4th, the Earl of Stanhope introduced into the House of Lords a measure for the formation of a National Portrait Gallery. From no one, either in the House of Peers or out of it, could such a proposition have emanated with better grace, or with a greater chance of the arguments in its favour receiving that attention which they deserve. His lordship, as the historian Lord Mahon, has a high name in the literary world; and his pursuits naturally incline him to feel a warm interest in the project he has undertaken to advocate—an interest, however, which ought to be, and doubtless is, shared by every intellectual member of the community at large. There are difficulties, as the Earl of Ellenborough and other noble lords remarked in the course of the debate which followed Lord Stan-

hope's proposal, in creating such a gallery of portraits as England ought to possess: but let us once have a suitable building for its reception, and ways and means will, we are confident, not be wanting to decorate it with the "forms and lineaments" of those who are worthy of being found there: the greatest difficulty will be in making such a selection. The motion was agreed to without a dissentient voice; and we are sure our readers, who may not have found opportunity to read Lord Stanhope's speech, introductory of the motion, as reported in the daily papers, will thank us for enabling them to do so in our own columns: we print it as reported in the *Times*, and it will well repay perusal for the truth of the arguments, and the eloquence with which they were supported. We should also have been well pleased to have followed it by Lord Ellenborough's sensible speech, but our space will not permit us to do so.

"Earl Stanhope said that, in rising to bring forward the motion of which he had given notice for the gradual formation of a gallery of portraits, he begged to explain that this question was not altogether new to Parliament. Four years since, just before the last general election, and while he was a member of the House of Commons, he introduced this project in a conversation on the miscellaneous estimates. A right hon. gentleman who represented the Government at that time—it was the Government of the noble earl (Derby)—expressed himself in approving terms of that proposal. Other members expressed the same approbation, and he was so far encouraged as to give notice that, if he had the honour of a seat in the next House of Commons, he would bring the matter forward as a substantive motion. He was not able to fulfil that pledge, because, as it chanced, he had not the good fortune to obtain a seat; but now, although in another place, he would endeavour to redeem his pledge. He thought he could not better introduce this question to their lordships than by asking the greater number of them to recall to mind what they had seen in the galleries of foreign countries. Many among their lordships must have felt no small degree of weariness and disgust on passing through an almost interminable line of tawdry battle scenes of the largest dimensions at Versailles. Many of these battle scenes would no doubt recall the words of a modern author, who had described them as 'acres of spoilt canvass.' Many such acres of spoilt canvass presented themselves upon the walls of Versailles; but their lordships would also recollect the great pleasure, and as it were refreshment, with which they had passed from all these tawdry battle pieces and pageants into a smaller gallery, less gorgeously decorated, and containing excellent contemporary portraits of French celebrities. Few Englishmen could have been at Versailles without wishing that in our own country the errors of the larger gallery should be avoided, and the small gallery not only adopted but further extended. In this country the portraits of our great historical characters were very numerous. He doubted, indeed, whether in any country this class of portraits so much abounded, but they were scattered far and wide—many of them in country houses and in private collections; and it was only now and then that a single portrait or a whole collection was exposed for sale. There were many advantages to be derived from forming such a gallery. The main recommendation was, that it would afford great pleasure and instruction to the industrious classes. It would also be a boon to men of letters."

After quoting the opinion of Mr. T. Carlyle on the importance of the subject, his lordship proceeded:—

"He thought the testimony of so gifted a man as Mr. Carlyle should be allowed to stand alone, though he could easily accumulate other authorities. It might be shown also that the formation of such a gallery would be of very great importance in the promotion of Art. It would be of immense advantage to portrait painters to be able to see in a collected form a series of portraits of men famed in British

history, from the first rude attempts of panel painting, in the thirteenth or fourteenth century, down to the finished works of Reynolds and Lawrence. It would enable them to soar above the mere attempt at reproducing a likeness, and to give that higher tone which was essential to maintain the true dignity of portrait painting. But to historical painters such a collection would be of still greater value. Their lordships would no doubt recollect two great pictures—'The Execution of Montrose' and 'The Last Sleep of Argyll'—for which a friend of his, Mr. Ward, had received commissions. Mr. Ward had told him that it was scarcely possible to conceive how much difficulty he had met with in ascertaining the correct likeness, and the dress, and the decorations of the time, in preparing those two pictures. In a letter to Mr. Sydney Herbert, in January last, upon a proposal to purchase a picture of Sir Walter Raleigh for the National Gallery, Sir Charles Eastlake, the President of the Royal Academy, said:—

"I thank you for your information about the portrait of Sir Walter Raleigh. . . . For the National Gallery it is not, I think, adapted. But whenever I hear of portraits for sale, of historical interest, I cannot help wishing that a gallery could be formed exclusively for authentic likenesses of celebrated individuals, not necessarily with reference to the merits of the works of Art. I believe that an extensive gallery of portraits, with catalogues containing good and short biographical notices, would be useful in many ways, and especially as a not unimportant element of education."

After such testimony it was not necessary to say more in proof of the advantages which would accrue to Art from the establishment of such a gallery as he had suggested. But there was another mode in which, he thought, it would be valuable. It would be useful as an incitement to honourable exertion. They all remembered the exclamation ascribed to Nelson, just before the battle of the Nile—'A coronet, or Westminster Abbey.' Of a coronet he would say nothing, lest he should be supposed to desire to revive recent debates; and, with respect to a place in Westminster Abbey, it was as difficult to attain as a seat in their lordships' house. If the thought of a tomb in Westminster Abbey was so inspiring to such a mind as Nelson's, at so great a moment, would not the same effect have been produced by the thought of one day occupying a place in the collection of portraits of his country's worthies? The hope of honourable distinction served at all times as an incentive to exertion. In the emphatic words of one of the wisest and most sagacious men that ever lived, *contemptu fame contemni virtutes*. He had spoken of the advantages from such a scheme. Their lordships had a right to require, and it was his duty to show, by what particular means those advantages were to be secured. He should be sorry if the execution of the project were postponed until a new National Gallery was erected. To plan, and still more to construct, a National Gallery must be a work of time, and if the gallery were ready now, to place there the few pictures which at first could be obtained would give an appearance almost unsightly. He hoped her Majesty's Government would assign some temporary apartments, either in Marlborough House or in the Palace of Westminster for the purpose, and then the scheme could at an early period be commenced. The supply of portraits would depend on two sources—purchases and presents. It would, of course, be necessary to establish some authority which should direct purchasers and consider offers of presents. It would be of the greatest importance that anybody exercising that authority should possess sufficient discernment to make proper purchases and also a power of refusal in cases of offers of portraits, the reception of which in a national collection would not be warranted by the importance of the persons represented. Such a body actually existed in the Fine Arts Commission which was established by Sir R. Peel in the first year of his Administration, under whose direction and supervision most of the decorations of the palace in which their lordships were assembled had been executed. The marble statues which ornamented one of the halls of that house had been placed there

* To be continued.

under the authority of that commission, of which Prince Albert, distinguished for his love and patronage of Art, was chairman, and Sir C. Eastlake was secretary. The commission had first to consider upon historical grounds who should be the persons selected; next to consider upon artistic grounds what sculptors should be entrusted with the execution of the statues; and they had also generally to superintend and direct the progress of the work. He thought that commission might be safely allowed to continue its functions, and even to extend them in the direction which he proposed. Adverting to the question of expense, it would, of course, be a matter for the House of Commons to consider what should be the annual vote for such a purpose; but he was inclined to believe that a building once obtained, a very moderate sum would suffice to provide the portraits worthy of being placed in it. He thought a yearly sum of 500*l.* would be adequate, although, perhaps, for the first year, a sum of 1000*l.* might be necessary; but it must be clearly understood that, in the event of the purchases made in any one year not requiring the whole sum voted by Parliament, the balance should remain as a fund for future purchases, as opportunities might occur, works of Art not being always in constant supply. It might be necessary for him to give some grounds for his belief that much might be done, even with the very moderate sum he had mentioned; and therefore he would state a few cases of remarkable portraits sold for small sums during the last few years. He had been present when a full-length portrait of Mr. Pitt by Gainsborough, an undoubted original, was sold by auction for 100 guineas. He might also mention a portrait of Chatham, of whom only three portraits were known to exist, which was sold to Sir R. Peel for 80 guineas. About eleven years ago the portrait of Blackstone, an engraving of which appeared in all editions of the learned judge's "Commentaries," was sold for 80 guineas; and an original portrait of Mr. Percival was purchased by the late Sir R. Inglis for 40*l.* Those instances justified him in believing that with a very moderate sum of money a valuable collection of national portraits could be formed, but undoubtedly the body to whom the duty of expending that money should be intrusted ought to exercise its power with care and discernment. Another part of its duties would consist in deciding upon offers of presents which might be made. He believed from that source many valuable portraits might be expected, for since he had given notice of his motion several noble peers had told him they were willing to make presents to a national collection. When it was remembered how many of their lordships were descended from men famous in the history of this country, it was not unreasonable to expect valuable contributions from those who possessed, as many did, four or five portraits of their eminent ancestors, and the honour of having a place assigned to such portraits in a national collection would be great incentive to such liberality. There might be other cases, too, where persons possessing valuable portraits had no convenient place for them in their own houses, and who would willingly bestow them on a national collection such as he suggested. The most careful supervision, however, would be required in deciding upon the acceptance or refusal of the offers of presents which would be made to the body exercising the supreme control. He attached the greatest importance to the power of refusal, and believed the whole success of the undertaking would depend upon the proper exercise of that power, for if they admitted into a national collection portraits of those who possessed no adequate claim to such honour the inevitable consequence would be that the gallery would be deprived of all the distinction which he wished to see attached to it. The power of refusal must therefore be necessarily exercised in many cases, and should be facilitated by a rule that in no case should the portrait of any living individual be admitted into the gallery which he wished to see founded. He proposed that three-fourths of the votes of the committee of selection should be necessary for the acceptance and detention of a portrait,

so as to have it hung upon the walls of the gallery. There was another question—namely, whether the superintending body ought not to be allowed the power of parting with duplicates? Suppose a present of a portrait sent to the gallery, and that there was in the gallery at that time a portrait of the same person at the same time of life, and, in fact, a kind of counter-part, it might be then in the power of the committee to receive the present, and to dispose of the portrait which they already possessed. But these were points of detail with which it was not necessary to detain their lordships. He proposed to give a general power to the superintending body to receive presents. He felt sure that a beginning would soon be made. If only a temporary apartment were erected, and only a grant of 1000*l.* were made on the estimates of this year, he ventured to say the whole thing would be done; his opinion being, that such would be the popular favour with which this gallery would be regarded, that there would be no want of portraits, but that donations would come in in such considerable numbers, that there would be no fear of the failure of the scheme. He only desired to see the project commenced. There were two collections of portraits in this country, about which it might be expected he should say something. It was some time ago thought that they might form the foundation of a portrait gallery, such as he had described, out of the collections at Hampton Court and the British Museum, but there were obstacles to both. With regard to Hampton Court, he should be sorry to diminish the inducement to make a summer's holiday excursion to see the pictures there, especially as regarded those who were confined within the walls of London during the greater part of the year. With respect to the British Museum, there were some portraits there, some of which were curious and some valuable, but many of them were ill-placed. Some persons proposed to transfer the whole of this collection to a national gallery of portraits, but he did not think the whole of them would be worthy of a place there. It would be necessary to make a selection, and take the best and leave the worst. * * * He supposed it was unnecessary for him to state that in the proposed collection it should be a fundamental condition that none but authentic portraits should be admitted, and that there should be no such imaginary characters as they saw on the walls of Holyrood House, where there was a long line of Scottish kings, all assumed to be painted before the art of oil-painting was known in this country. All such imaginary portraits, he repeated, ought to find no place in the proposed gallery. He thought he had now gone through all the principal considerations which he had wished to suggest to their lordships, and it only remained for him to apologise for having so long detained their lordships. But he thought that these questions were interesting to a great body of persons. When they considered the great number of their countrymen who were struggling in the various walks of Art, and intent on that rugged path that led to fame, he thought that some mark of sympathy and some encouragement should be given to their exertions. Depend upon it, the time was past when, considering the education of the people of this country, they could disregard the refining influence of Art. This truth was every day becoming more widely understood and acknowledged—that the Fine Arts, under true rules and guidance, were to be ranked, not merely among the ornaments of human life, but among the appointed means for the elevation and improvement of the human mind. Believing this to be a step in the right direction, and a movement in advance, he begged to move—

"That a humble address be presented to her Majesty, that her Majesty would be graciously pleased to take into her royal consideration, in connexion with the site of the present National Gallery, the practicability and expediency of forming by degrees a gallery of original portraits, such portraits to consist as far as possible of those persons who are most honourably commemorated in British history as warriors or as statesmen, or in arts, in literature, or in science."

THE ROYAL PICTURES.

FOUNTAIN AT MADRID.

D. Roberts, R.A., Painter. J. Cousen, Engraver.
Size of the Picture, 1 ft. 2 in. by 10 in.

THIS picture, like that of the "Bridge of Toledo," by the same painter, which was engraved in an early part of this publication, is the result of a commission received from the Queen; her Majesty having selected the subject from a number of Mr. Roberts's Spanish sketches, and directed a painting to be executed from it, in oil, to be presented to the Prince Consort on his birthday. The picture has never been publicly exhibited.

Madrid has fewer attractions for such a pencil as Mr. Roberts's than most of the cities of Spain, from the fact of its being of later origin, and therefore possessing none of those remarkable architectural features introduced by the Saracens, such as are seen in Grenada, Seville, Cordova, Burgos, Toledo, and others—relics of the period which Byron laments over:

"Oh lovely Spain! renowned romantic land!
Where is that standard which Pelagio bore,
When Cava's traitor-sire first called the band
That dyed thy mountain streams with Gothic gore?
Where are those bloody banners which of yore
Waved o'er thy sons, victorious to the gate,
And drove at last the spoilers to their shore?
Red gleamed the cross, and waved the crescent pale,
While Africa's echoes thrilled with Moorish matron's wail."

Till the reign of Philip II., son of the Emperor Charles V., Madrid was little more than a hunting residence for the Spanish monarch: Philip fixed his court there, and henceforth it became the capital of his dominions. Yet the city is not without much that is interesting to an artist, though all partakes of a comparatively modern character; the two noble bridges thrown over the insignificant river of the Manzanares—so scanty a stream as to have given rise to the witty remark, "that the Kings of Spain ought to sell the bridges, and purchase water with the money;" the wide and well-planted promenades in and about the city, the magnificent churches, and imposing public buildings, are not without a certain value in the estimation of the painter. The squares add greatly to the splendour of Madrid, especially that known as Plaza Mayor, where the bull-fights are exhibited; its form is quadrilateral, and it is enclosed by three hundred houses, uniform in height, of six stories, each story having a handsome balcony, supported by columns of grey granite, which constitute a fine piazza all round. The churches and convents are numerous, but scarcely one can be pointed out as an example of a pure style of architecture. The palace is considered one of the finest royal residences in Europe: it is a large square building, which stands upon an eminence commanding a fine view of the adjacent country; the interior is decorated in a style of costly magnificence, is richly furnished, and adorned with valuable pictures. The celebrated palace of the Escorial is some few miles distant from the city.

Public promenades abound in Madrid. The most resorted to is the *Prado*, a portion of which is seen in Mr. Roberts's picture; it contains a variety of alleys lined with double rows of trees, and ornamented with beautiful fountains, of which that in the picture stands at the entrance to the *Prado*. Adjoining the promenade is the *Retiro*, a large and beautiful garden. On the east side of the *Prado* is the National Gallery, a splendid building with a noble Tuscan portico and Doric colonnades; the collection of paintings hanging here is, perhaps, unsurpassed by any in Europe for their general excellence.

The fountain at the entrance of the *Prado* forms a picturesque and striking foreground object in the picture here engraved; the edifice seen in the background is the Observatory: the groups of figures in their various characteristic costumes enliven and enrich the scene. The picture is painted almost throughout in the low, warm yellowish tints, which this artist used to employ some years back much oftener than he does now. The figures have also little positive colour, but they are brought forward with sufficient power.

The picture is in the collection at Osborne.

CHAPTER IV.

The Duties of the Gifted—Poets of the Pen and Pencil—Let her Die!—A last Appeal—The Cathedral of Catania—Fresco of the Sacerist—The Trees of Etna—Groans of the Dying—Effect on Survivors—A Legend of San Giacomo—A Team of old time—The Magician of Antioch—Cyprian, Bishop and Martyr—Santa Christina—A Studio in the New Forest—Go but deep enough!—L'Amphitryon où l'on ne dine pas—The disappointed one!—A Poacher—Grief in the Forest—Woe for our Chums and Gossips—Imperial appreciation of English Art—Street Life in Rome—The Morra—The Cripple of the Scalinata—Roman Children at their Studies—The Battle of Scarston—The Traitor Duke—Gratitude of King Canute—Inkermann—“Spring hath come!”—Song of the Turkish Poet—Lament of a Captive Queen—Dante, “Il Purgatorio”—Buonconte of Montefeltro—Spirits of Light and Darkness—The Price of a Tear.

THERE are duties imposed on you by your heaven-sent dower of genius, oh ye, the true-born sons of Art; and one of the most imperative among them is this. That ye fail not in that binding clause of your mission which constitutes you the teachers of all whose pilgrimage of life is appointed to them in a less exalted region of thought and feeling than that reserved for yourselves. It is for *you* to aid us in our efforts after a better understanding of things, and look well to it, lest we, whose hearts are ever open to the profit of such lessons as ye prepare for us, and whose eyes wait trustfully on the work of your hands, should be left still wandering in the gloom of our darkness, because ye haste not to cast around us the bright radiance of that light, which the artist, no less than the poet of the pen, has been sent on this lower earth to dispense for our behoof.

Below is a commencement already made by one of the last-named missionaries—made with head fully given to the work, and with heart well attuned to the service. Let us hope that no word of it has been lost, but do *you* cause that which has, as yet, but amended the reader, to become the effectual monitor of the thousands who do not read. And not of those alone who lack the ability to do so, but of the crowds whose butterfly days present so fair a sunshine that they cannot choose but pass the whole sum of them in fluttering amidst the beams. For even these are accessible to the monition of the painter: their idle glance is not refused to the canvas, whatever may become of the printed page. A picture! oh, by all means! it is a pleasure the more, and stand aside to let them take a fair look at it, for there may be one among them that shall profit thereby.

To them succeeds a larger, if not so bright a train of spectators; these are they who have not light enough in their dreary experience of that which—for lack of another term—they too call *life*, to let them see the beneficent words of the poet, but to you, oh painter, their eyes and hearts are still accessible: see that you do not leave them longer without appeal. Here are the pictures: they are not joyous ones, but they show truth; and what *is*—alas that it should be so! But shall these things continue to be thus? Let your part of protestation against them be done, and when you have spoken to the great heart of the public; when the voice of approval has decreed that your work is of Art's contributions to the well-being of humanity; when, by the beneficent power of the graver, your teachings have been reproduced, till brought to the knowledge of all; then, if you shall hear but of one whose downward step has been arrested by the warning they hold forth, will not your reward be a rich one, and shall not your fellow-labourer, the poet, declare you both to be largely repaid?

It is within the walls of a prison that you find your subject; that hapless girl! The moving words that follow tell you sufficiently what your part in the work must be.

“Name her not, the guilty one!
Virtue turns aside for shame
At the mention of her name:
Very evilly hath she done!
Pity is on her mis-spent;
She was born of guilty kin,
Her life's course hath guilty been;
Unto school she never went,
And what'er she learnt was sin:
Let her die!”

“She was nurtured for her fate,
Beautiful she was and vain,
Like a child of sinful Cain,
She was born a reprobate!
Lives like hers the world defile,
Plead not for her, let her die,
As the child of infamy!
Ignorant, and poor, and vile,
Plague-spot to the public eye,
Let her die.”*

“Let her die!” But at least let us hear her last appeal—the teacher of the pen has not shrunk from giving it; do not you spare to send it, trumpet-tongued, where the idiest must at least be made to know of its utterance, and cannot plead that “if such things were, they wist it not.” Listen to her, that poor wailing outcast; the mandate has gone forth; these early rays of morning—alas, that the sweet sunshine should ever seem out of place—are the last that her eyes shall behold; pass some few short hours, and the narrow cell she kneels in shall be exchanged for a yet narrower abode. But we know whither it is that her last words are ascending, and shall they not prevail?

“Let my cry of anguish reach thee,
God of love!”

Amen! and amen!
Hear beside some portion of the lesson to ourselves, which the writer has conveyed in other parts of these sad heart-moanings—thus they commence:

“I am young, alas! so young,
And the world has been my foe,
And by hardship, wrong, and woe
Hath my bleeding heart been stung.
There was none, O God! to teach me,
What was wrong and what was right.
I have sinned before thy sight.
Let my cry of anguish reach thee,
Piercing through the glooms of night,
God of love!”

“I must perish in my youth,
But, had I been better taught,
And did virtue as it ought.
* * * * *
I should not have fallen so low.
* * * * *
’Tis the wretch's dire mischance,
To be born in sin and woe.
Pity Thou my ignorance,
God of love!”†

In the sacristy of the cathedral of Catania is a fresco, preserved with scrupulous care, although by no means remarkable for its merit as a work of Art: the interest attached to the picture consists principally in the startling fidelity with which the artist has rendered the awful event depicted; this is the eruption of Etna in the year 1669, and in the fresco that fearful catastrophe is set before the spectator with a vivid reality, truly surprising.

A Sicilian artist, profoundly impressed by the terrors delineated in this work, assured the present writer that nothing short of the actual eruption could be more awfully true than the picture before us—“so far as the eye alone is concerned,” he added; “but there were sounds,” continued the speaker with a deep shudder, “there were sounds of which the pencil can of course tell you nothing, yet these gave an addition of horror such as never can be effaced from the memory of any who heard them. Nay, they are in my ears now!” exclaimed the excited Italian, and he lifted his hands to his head, as one who would shut out some fearful sound.

These words were uttered some few months after the last great eruption of Etna, to which our colloquist had been witness; he was thus a competent judge, and, among other peculiarities of the dreadful scene, he described the effect on the trees, as the resistless flood of molten lava

neared them. But this was not until the frequent intercourse of a long journey, taken in his company, had produced a sort of intimacy, the subject being one that was evidently not to be lightly approached.

His home, to which he was then returning from the study of his Art in Rome, was at the distance of some twenty miles from Catania, and he had mounted his horse, as he subsequently related, at the first rumour of an eruption, but long before he reached the foot of the mountain, the terror of the animal compelled him to dismount, and the horse was left to the care of a vine-dresser. Proceeding on foot, our informant found his progress much impeded by smoke and sulphurous fumes; the sun glared fiercely through the lurid air; dark clouds, edged with a glittering, hard, marble-like whiteness, such as he had never seen before, lent a further strangeness to the aspect of things, and the whole atmosphere was full of a sobbing, moaning sound, now rising into a sort of menace, and anon becoming little more than a fluttering sigh, as it were the last breath of a creature expiring in the agonies of torture.

Nor did this wailing seem to proceed from the mountain alone, all things appeared to sympathise with the Titan sufferer: earth, air, and sea alike sent forth the expression of grief and pain; all space was pervaded by that vast anguish, and the peasantry, familiar as they are with these phenomena, wore looks of anxiety and fear that became ever deeper as our informant drew nearer to the mountain. He had ultimately approached the rivers of lava so closely as to have his eyebrows singed off and his whole face much scorched; on our expressing surprise that he should endure so needless an infliction, he replied—“Nay, rather ask me by what influence I was restrained from standing, fixed and rooted as I was, until devoured altogether by that sea of fire; for the sights and sounds of that horrible night had exercised so strange a fascination over me that during the greater part of it I sometimes think I must have been mad.”

Then it was that our Sicilian acquaintance described the effect of the eruption on the trees: he spoke “with bated breath,” and declared that, as the lava approached them, they seemed to quiver, with the dread of creatures conscious to their fate. The groans of those inanimate objects, as the glowing destruction neared them, had made it impossible to him to remember that they were not sentient beings, and had caused him to suffer a sense of pain and grief, the effects of which he had been long in throwing off. At the last moment, and when he no longer dared to look at them but from a great distance, all their leaves turned of a livid white; they were *blanched* by the fervour of the heat, and this before the lava had touched them; nay while it was yet at considerable distance. Once *touched*, they burst into raging flame in every part; and before that fatal river of death could fully roll its annihilating waves around them, each hapless creature had fallen on the flood, a heap of ashes.

“Each hapless creature,” the speaker's own words: the idea of conscious suffering had manifestly not even yet departed from his mind; nor could he recall the scene he had witnessed without shuddering.

That there was no exaggeration in this description was obvious; and we were ourselves in a condition to vouch for a portion of its truth, from certain facts presented to our notice on Mount Vesuvius, some years earlier. By an act of culpable imprudence, partly our own, but chiefly attributable to our guide, who should have used his authority to prevent it, we were for some time in imminent danger—a circumstance that never need occur on Vesuvius; as many of our readers will know. Into the details of that day's history we do not propose to enter; but it was then that we did ourselves behold the *instant* destruction described by our Sicilian acquaintance. The effect, however, is so extraordinary, that one requires the testimony of one's eyes to believe it possible: at one moment, the object is there, in its entirety; before the succeeding second has passed, it has become a heap of white ashes; and even these—disappearing beneath the next heavily rolling

* Mary Howitt, “Lyrics of Life.”
† Ibid, “The Heart of the Outcast.”

wave of that low hissing flood, which seems to mutter anathemas on its victims,—do not leave the faintest trace to show that they have been.

A Franciscan monk, pleasing in manner, and much more highly cultivated than is usual with men of that brotherhood,* was the companion of the artist, whom he called Don Ippolito, and the colour of whose life had apparently been changed by the spectacle he had witnessed. Other circumstances of the eruption, in addition to those related above, were subsequently described by both; but for these we have not space: our business is henceforward with the portfolio of the artist, which was freely offered to our inspection during the sort of intimacy that occasionally results from the fortuitous meeting of travellers.

Legends of the saints, and subjects of similar character, predominated; they may, at some future time, be revered as altar-pieces in many a village church, among the more remote districts of the island. Here are some few of those best remembered.

The first is a legend of San Giacomo, and the saint is represented in the act of guiding a plough, to which he has harnessed a bear: beside him lie the oxen, by whom the office of drawing the plough had previously been performed; but they are dead—the bear has killed them; and it is in token of the repentance awakened in him by the exhortations of San Giacomo, that Bruin permits himself to be harnessed in their stead.

And very earnestly does he bend himself to the work: a bear can look ironically enough when he pleases, as we all know, and is at no loss to mark his sense of a joke: but no thought of jesting is in the head of this good fellow; he wears a face of the gravest, nay the most compunctious solemnity, and lifts no eye to that of the spectator, as who should say, "Is not this rare sport?" The Saint is equally intent, and the state of the ground gives evidence that their husbandry is making good progress.

A second study gives the conversion of St. Cyprian† by Santa Justina. Still wearing the robes of the Pagan magician, he stands before the beautiful Christian with a face from which the last shades of doubt have departed; his books of magic art lie neglected at his feet—soon to be given to the flames; and behind the Saint, who has converted the magician, is seen the figure of a handsome youth, departing with the action and expression of one reduced to despair. In this picture the artist has fully related the legend, which is simply as follows.

A noble of Antioch, long the suitor of Justina, has recourse to the magic art of a renowned sorcerer; but the latter, having exhausted his powers in vain, is at length reduced to inquire of Santa Justina by what means she has foiled his efforts, and ultimately caused the most powerful of his demons—whom, in his rage, he had finally cast loose on her—to declare himself worsted, and decline all further attack. The Saint informs him that she does all in the power of the Cross, and the conversion of the sorcerer is the result. Receiving the rite of baptism, he is thenceforward called Cyprian, and subsequently became Bishop of Antioch: he suffered martyrdom, together with Santa Justina herself, under the Emperor Diocletian, in the year 304.

Full of movement and spirit is the sketch that next succeeds; the legend is that of St. Egidius, who is standing before the cave which forms his hermitage. Within its shadow is the hind, which he has rescued; an arrow from the hunters, who have driven her to that refuge, still quivers in her side, whence the Saint has not had time to extract it: for the hunt is all upon him; but the dogs are restrained from entering the

cave by the power of his sanctity, and certain of the hunters are already kneeling, although others yet remain contending with the saint, whose hand is extended between them and the rescued animal. The scene of this prettily told story is eminently beautiful, and will be remembered with pleasure by more than one of our readers—being a faithful reproduction of one of the wildest and yet most lovely defiles to be found in that exquisite region, of which Vico is held to be the queen and capital.

The last of these subjects that we shall now mention, represents the preparation for one among the many torments suffered by Santa Christina, who is discovered in her dungeon filled with reptiles, which have, however, no power to harm her. The rays of light, falling into her prison from narrow clefts in the rock-like walls, serve to exhibit the flexible forms and brilliant colours of these reptiles, which do but awaken new feelings of devotion to their Creator in the heart of the saint. These it was her wont to pour forth in hymns that troubled the repose of her enemies, and to repress them, an executioner is now entering the partially opened door; he holds in his hand the instruments with which he is about to tear out her tongue, but the Saint regards him calmly, and without fear.

All these legends were evidently depicted in good faith, and as events that had veritably occurred: that men of education, one of them a person of some learning, could so accept them, is, without doubt, extraordinary: yet, thus it was; the grave simplicity with which all the details of these incidents, sought by the writer, were afforded, whether by the monk or his young friend, spoke clearly of earnest conviction. The smile of incredulity would have been deep offence; and the writer enjoyed all the more content in the examination of these studies, from the fact that no one likely to inflict such pain on their author, or his clerical guide, was partaker of the pleasure.

Among the many fair shrines where Art is most fitly worshipped, and which still reserve their almost untouched wealth for him whose genius shall supply the divining rod to their gushing fountains, is that wherein the character and habits of the "ferre nature," the masterless denizens of the wild, may be "taken in the manner," and are shown—not as man has fashioned them to artificial life, in the haunts of luxury, but as boon Nature has made them in her solitudes, and as they revel and riot amidst the joyous abodes appointed to them by that Supreme Beneficence which has created them for happiness no less than ourselves.

Not that we would seek to undervalue the home-bred favourite—by no means; he, too, is heartily welcome, whether dog or horse, and whatever his rank, so only that he be perfect in his kind: the "cleverest" of hunters and the shooting pony "worth his weight in gold;" the wolf-hound and "my lady's brach";—none shall come amiss; but let not any, or all of them, exclude the frank inhabitants of mount and forest: give us the pride of our fields, and the pet of our hearths, but let us also have the gladome dwellers by moor and stream.

It is true that we possess those glorious annals of deer-stalking, to which the world of Art owes so many a bright inspiring theme, but we want more, and in more varied sort. Not to every man is it given to range brown moor and heathery fell at will, nor can the haunt of the boar or buffalo—so well beloved of the vigorous Fleming, so devoutly worshipped by the zealous and right-worthy Roman follower of Snuyders in our own day—be as readily attained by their English brethren; but neither are the narrower limits of lone vale and shadowy woodland niggard of their inspiration for such as seek aright. Let the votary bring but a spirit attuned to the delicious harmonies ever breathing around those unsullied shrines of Nature, which are equally the true fanes of Art, and for him shall the Genius Loci, waiting to be propitiated by every altar, pour forth his fairest gifts.

Nor does any need to make a long pilgrimage;

he has but to lift his eyes, and—provided always he be not "pent" within the noisome limits of some great town—there shall ever be wealth of objects for his worship. Great beauty or striking peculiarities of character, however attractive, are not indispensable: the least promising of localities will scarcely fail to present some portion of that life and movement which are among the first demands of the painter: treasures are to be found in each devotions path of nature's own free tracing, and blossoms of loveliness hang on the lowliest bramble for him who has power to perceive them.

But say that you have the privilege of selection, and, taking of the best, have plunged into the recesses of our Hampshire woods. Go but deep enough, and you will not complain of your studio; neither shall there be any lack of company to sit for their portraits, supposing the delineation of character to be one of your objects. There are wilds, or there were such, in the happier ancient days of some ten years back, in certain parts of the New Forest (misnamed assuredly, seeing how venerable is its age), where your highest aspirations after beauty in nature shall be satisfied, while the "ferre" of the place will approve themselves to be in all respects of the purest water.

To secure these, you must, however, not content yourself with hovering on the verge of things, you must plunge boldly into the depths; press through entangling underwood, and never trouble yourself to be seeking a path, for where you go there is none. Count rather on the long thorny bramble, the sarcastic point of the fretful gorse, the lucent arms of the glittering holly, and bold Sir Blackthorn aiding them with such might as he hath; for all these shall oppose your access to that region of delights. Yea, your sweet friend the woodbine, will do her utmost to harry you thence with her delicate coils; nor shall the grave and solemn ivy spare his potent frown, to say nothing of those tendrils wherewith he has tied together a matted barrier of impervious hroom and tough, though pliant fern.

Yet keep on; hold-stout heart, and when you have beaten all down knightly, you shall—

"We shall get through, ridiculous prate-apace, and have done with it!"

Not at all! You shall do nothing of the sort: these are the mere ontlying works; the more potent defences have yet to be stormed; but all mention of their names shall be spared you. Do I not know your "genus irritabile?" There is only some few hundred of good stout furze-bushes, fifteen to eighteen feet high, at this moment impeding our passage, but as these are wholly impenetrable, we must e'en turn fairly back, and make our way as best we can to the point whence we got into this *Imbroglia*.

Take patience, nevertheless, and by no means be discouraged: at our next attempt we shall be more successful in hitting the weak point, and that accomplished, great is your reward! Keep good heart only, for at length we stand in face of the portals to be forced. Dark strong-armed bats are crossing on sullen wing, for just now we are in the region of perpetual twilight, and the horned owl is adding his harsh remonstrance, as he sits, marvelling at our intrusion, among the branches of that stunted oak.

A more open space succeeds, and sailing across it come the dusky raven, the kite, on his wide powerful wing, and the sharp-beaked hawk, with his pitiless cruelty of gaze.

Or, less imposing, but more cheerful of aspect, there steals from the copsewood an elegant-looking congener of the weazle tribe. He darts, lightning-like, across the sweet sunny glade,—which has at last repaid our toil,—amazed to find his delicious home invaded, and in haste to make the unwonted advent known.

The burley grey badger may, perchance, succeed our last hurried visitant, but for his arrival you may have to wait patiently, seeing that he does not care to enlarge the circle of his acquaintance. The fox is more accessible, or rather, being a gentleman of rambling propensities, you shall stumble on him now and then when neither of you has expected the presence of the other; and should you chance to beat up his quarters while his children are sporting

* Taking the four great divisions of the monastic orders, the Benedictines are still the most learned, as of old; but among the Dominicans, men of solid attainments are frequently met with, and the Augustinians are not without instances of learning; yet neither they nor the Franciscans are considered to maintain so much of the distinction of older times as do the sons of St. Benedict.

† Not to be confounded with Cyprian, Bishop of Carthage, whose martyrdom—also by decapitation, for which cause he has the sword as one of his attributes—took place half a century before that of Santa Justina's convert, the Bishop of Antioch.

around him, or when his lady, the vixen, has gathered the youth of their family for educational duties, you need scarcely ask a more animated group for your sketch-book than that household shall present.

And while now we seat us beside the deep dark water-course, adown whose precipitous, but happily not very high bank, we have just tumbled with so little ceremony, to scramble up on the opposite shore, and have gained this fair sweet oasis of sunbright green, you shall hear an extract from the foxite annals.

The event commemorated is of the strictest truth—when they write history they keep wholly apart from fable, those well-judging foxes—its consequences plunged two respectable families of the ancient tribe of fox, into much grief, but though trying to your sensibilities, the story must needs be related, because there is at least a little dozen of pictures therein.*

The facts are as follow, and the scene to be depicted is on this wise. A flock of wild-geese have alighted on a broad estuary, rapidly narrowing into a sedgy river; the banks on one side are high and more richly wooded than is usual within the near neighbourhood of the sea, but the opposite shore is lower, and in the distance are the grey rocks of a bold wave-beaten promontory. From the underwood steals forth a well-grown fox, and perceiving the rich argosy on the water he at once proceeds to secure what he considers in his conscience to be his own portion in its wealth. Having drawn together a sufficient mass of tangled grasses, he suffers himself to float gently down beneath the veil thus formed towards the new arrivals, and under cover of the mask he has provided, succeeds in securing a heedless bird, whom he brings to land in good sportsman-like fashion. But there are certain considerations which prevent his beginning instantly to feast on the booty obtained, and he buries it amidst the low hanging branches of an old twisted thorn: that done he departs; but soon returns with a second fox, whom he leads directly to the tree, manifestly "on hospitable cares intent."

But, "What are the hopes of man?" sings the poet—"What those of foxes?" he might have asked; for, during our poor friend's absence, a lurking, poacherly fellow—see that you give him no free-forester look, but a veritable hang-dog aspect, won from many a jail—has crept from his hiding-place, and, carrying off the deposit from its rightful owner, has caused the consternation you are here to depict.

For a moment, our first acquaintance stands bewildered and confounded; his gossip, who arrived with that modest and disclaiming, yet well-pleased and above all respectful expression, with which men and foxes alike follow "L'Amphitruon où l'on dîne," has at length begun to suspect an intentional affront! He turns fiercely on his late revered inviter, whom he now confronts with reproachful eyes; but the honour of our despoiled Reinecke is not to be questioned with impunity, a mortal combat ensues—or rather not mortal, it would hardly have come to that—they were foxes, and without doubt the reasonable creatures on the four legs would have presently thrashed each other into a better comprehension of the matter, nor suffered any grievous injury on either side: but now—and I grieve to say it—must the two-legged brute come into the picture; he holds his deadly tube—a disguised and contraband thing, without name or decent kindred, we may be sure—in the villanous left hand, which hath so manifest a tendency to hide behind his back; this he brings to bear upon the champions who contend but for their honour, and shooting the intended host through his hospitable heart, he knocks over the wonder-struck guest before he has recovered from his amazement, when he too, poor disabled innocent, becomes that pestilent jail-bird's prey.

After that, I can do nothing for the rest of our halt but bewail the unmerited fate of my hapless chums. Had they perished in fair chase, and

with the music of the pack as their appropriate dirge!—But it skills not talking, nor can weeping avail, and I dry my tears. Admirable society in the woods is your fox, and good merry companions were these two, but with them we shall hold parley no more. "Woe is me, Alhama!"

His Imperial Majesty of France does but confirm the verdict of the French critics, when expressing his admiration for the works of our countryman, M'Innes; and it is to be regretted that his majesty's wish to become the possessor of the "Love and Piety," exhibited in Paris by that artist could not be gratified. There would have been a decided gratification to the English *amour propre* in meeting that pleasant acquaintance among the gems of Louis Napoleon's private collection in our subsequent visits to his capital; but "the present proprietor was not to be prevailed on to resign it," say the Parisian *Littérateurs* in Art, and there is nothing more to be done. The "Scene from the Life of Luther," an earlier work of the same artist, has been equally appreciated by the German critics, these last considering him to be one of those among our countrymen "who are most successfully working for the future." Very high praise this from our thoughtful cousins, by the way, since they do not always give us credit for that upward tendency, and even reproach us occasionally with loving the gold that glitters to-day better than the Fame that beams from the future; nay, better than Art itself, which, in the bosom of the true votary, should be placed above even Fame.

Few things gratify the "national vanity" of the present writer more than expressions of approval from the great German authorities; their knowledge of the subject is unquestionable; they are invariably just; thinking of the work only, never of the artist, with whom they have rarely personal acquaintance; and this is not without its value, when the productions of the day are in discussion, as many of our readers doubtless know.

We hear so much of the discouraging influences by which our artists are oppressed, that methinks it may not be amiss to record some few of the "per contra," to borrow a phrase from the "Ships, Colonies, and Commerce" school. The artist we have named above, for example, is well known to have been long estimated highly in the Roman world of Art, wherein much expectation was some years since awakened by reports of a work perfectly new as to subject, and certain to arrest universal attention, once it should leave the studio of the master. It has not yet appeared, and having no authority for the allusion, we refrain from describing its theme, but having deeply shared the interest excited by the rumour, one of our first inquiries on returning home, some time after, was for the painting in question, nor have we yet abandoned all hope of its appearance. The subject, as before remarked, we do not feel authorised to describe; but there are certain designs made by a different hand at the same period, respecting which we are under no such restraint; the artist, a very youthful student, but one of much promise, being no longer in existence, and the sketches, the subjects of which were in fact suggested by the writer, being entirely at our disposal.

The first presents a scene of out-door life in Italy: it is but too familiar to the quiet-loving traveller, for who is there so fortunate as never to have had his repose interrupted by the clamours of the *Morra*? This game, said to have been invented by Germanicus, to preserve his Legionaries from the perils of inaction, is still the delight of the populace; they have its implements ever at hand, since it is played with the fingers only.

The object to be obtained is an accurate guess at the number of fingers thrown out by your adversary from the closed hand. Thus, loud cries of "Uno! Quattro! Due! Tre! Quattro! Due! Quattro! Uno!" yelled forth at the topmost strength of their triple-brass lungs, resound from many an eager pair, wherever idlers "most do congregate;" and in Italy where are they not?

Look at this group—would not a stranger believe those two men, there standing in fierce

opposition, were preparing to tear each other's eyes out? How menacing are their gestures! how eagerly do they stretch forth their discoloured fingers, each thrusting his claw-like hand into most offensive proximity with the visage of his neighbour. But they are only playing the *Morra*, or *Mora*, as it is elsewhere called; and such are the fascinations of what we should call that wearisome exercise, that few of their own class, passing within the wide-spreading limits of the echoing sounds uttered by the players, can resist the temptation to pull up and watch the result.

Fair specimens of half the vagabondage of Rome have accordingly gathered around the group depicted by our artist; but the place of honour is accorded to one whom you all know well—"The Sturdy Beggar" of the Scalinata namely, no less a personage; he, who, without any legs at all, will prove himself more than a match for both yours, if at any time you seek to distance him across the broad platforms of that winding way, the uppermost of which has long been his undisputed domain. Get ready your *bajoccho*, 'tis a poor return for his joyous "Buon giorno Eccellenza;" but as none resist that appeal, so the dowry, carried to their carefully-selected *Sposi* by the daughters of this well-known mendicant, are said to be of no contemptible quality. Here we have him, returning to his dinner as do other men of business, when the toils of the morning have ended: he is mounted on a good serviceable ass, and his attendants humbly wait his pleasure, which, at this moment, is to watch the *Morra*. The head of our crippled acquaintance is a good portrait—the features are not those most frequently found in Italy, though the man is a Roman—they are rude, irregular, and somewhat harsh, the hair is verging towards grey; the eyes, also grey, are shrewd and keen; the general expression is bold, yet scarcely frank, and the whole face, though clever, is something short of prepossessing; nether limbs, our friend has none, and to this fact does he owe the prosperity of his fortunes.

The scene of our picture is the northern bank of the Tiber, near which that distinguished *Habitué* of the Piazza di Spagna makes his abode; the Ponte Rotto is within view; the church appearing on the far left is that of Santa Maria Egiziaea, and the Temple of Vesta may be discerned in the distance. Two Jewish ancients are holding consultation before the squalid entrance of what was once a palace, and beneath that broad portal are beautiful children, shaking their rags in a sort of frenzy, as they imitate the game performed by their seniors.

We have other incidents of life in Italy, depicted by the same hand; but, for the present, we prefer to select from sketches of a different character: these we take from the early times of our own history. And first we have the "Battle of Scarston."

Edmund Ironside, a noble figure, whose fine features and candid expression instantly bespeak our sympathies, is fighting hand to hand with the less graceful and more crafty-looking Canute. Already is the Dane slightly wounded, Edmund presses him closely, and manifestly holds the victory within his grasp. This is your first picture.

But there is unhappily a second, the warrior has treason beside him—alas for that old, old story, doomed ever to be repeated and scarcely stranger even to our own *spotless* times. Exalted from a low station to be Duke of Murcia by the injudicious partiality of Ethelred, significantly named the Unready, the father and predecessor of Edmund Ironside, Edric Stræon had resolved to slay his sovereign in the confusion of the strife; but, failing in this, and now perceiving that the battle was about to be decided by the fall of Canute, the traitorous wretch struck the head from the body of Osmeor, an attendant of Edmund, and bearing a strong resemblance to his master; then, holding the head aloft on his sword, he cried aloud, "Fly, ye men of Dorset and Devon! fly and save yourselves, for here is the head of your king!"

Compelled instantly to forego his advantage over Canute, Edmund eagerly bares his brow and exposes his heated features to the gaze of all around him, exhorting them to take

* The relation that follows is true to the letter; the incident was described in its minutest details by a sportsman, who witnessed all that took place, and has distorted no feature of the occurrence.

courage, but the effort is vain, a panic has seized his warriors, they fall into disorder, and all their prince's bravery and skill can but avail to maintain the combat until night once more closes on this, the second day of the conflict.

For the artist whose "joy is in the" battle, there is here motive for at least two pictures—perhaps for more. Let us now see what becomes of the traitor.

Many changes have taken place since the battle of Scarston: other combats have been sustained by Edmund Ironside, but the hiring of Canute has found means to render even victory fruitless: what, in fact, cannot treason in high places accomplish? More; he has contrived the murder of his sovereign, while that of Edwig, brother to Edmund, is also ultimately accomplished by his agency. But this last has not been done to the satisfaction of Canute, whose part in the crime is rendered too obvious by Streon's mismanagement. The crafty usurper has secretly vowed revenge, and Edric of Murcia is doomed. Rapacious as he is faithless, the traitor has entered that rude building on the Thames, which serves as the palace of Canute, whom you perceive to occupy the chair of state; with intent to complain of broken promises, and to seek rewards too long withheld. Around the king are fierce-looking chieftains of his own land, and beside his chair is Eric of Norway; before them stands the Duke of Murcia, dark passions deform his else handsome face, and he angrily bids Canute remember that for him he had imperilled the welfare of his soul.

"Not for me," retorts the offended monarch, interrupting the stream of revelations fast pouring from the lips of the excited Edric; "not for me, but for thine own ambitious ends, hast thou defiled thy hands with murder. How traitor! thou didst compass the death of thy sovereign? Thou!—Be thine own words thy condemnation."

Canute turned towards Eric of Norway, who struck the Duke to the floor with his battle-axe. Others then fell upon him, he was strangled by their fierce hands before the eyes of the man who had bought him for his evil purposes; and the last soul had scarcely been gasped forth from his blackened corpse, before the voice of Canute rose high above the tumult. "This traitor, self-convicted, came to seek the reward of his treason," he exclaimed, "and ye have bestowed it fully." "Throw the carrion to the river," added the scornful monarch, and a moment later the dark waves rolled over the betrayer of his master.

History does not give us warrant for the introduction of any other figure that might relieve the gloomy effect produced by those iron visaged warriors who alone took part in the well-authenticated event here proposed for your study: hoy-attendants might nevertheless be permitted to give the relief of their grace and beauty to the darksome group; dogs of appropriate breed would not be out of place, and even female figures might be suffered to cross the entrance of the rude hall, or be seen in the ante-room beyond it; but the persons truly belonging to our picture, are those here mentioned only.

Talking of battles, might it not be supposed that Byron had the fearfully glorious day of Inkermann in prophetic vision before him when he wrote the lines that follow. Could any one, writing from the field, have depicted more faithfully the dark opening of that terrible drama? Its anniversary is closing as the stanza is here transcribed.* May the lives then so freely offered up, avail to save the world from the frequent recurrence of these terrible Holocausts! But does not many a name, whether of the survivors or the dead, appeal to the sympathies of the artist as he recalls that day, demanding from him the wreath of immortality which his hand—no less than that of the poet—holds the proud privilege of twining for the brow of the

* The commemorative bonfires were blazing on the distant hills when these lines were written. Future anniversaries will happily bring us less vindictive memories than those still permitted to mingle with the proud thought of our glorious "battle for the right" at Inkermann: wherefore let us hope that the November last bygone will prove to be also the last of the "Guy Fawkes" exhibitions.

victor? They do, and he will admit the claim: let us now turn to the words of the author we have cited:—

"Hark! through the silence of the dull cold night,
The hum of armies gathering rank on rank.
Lo! dusky masses steal in dubious sight
Along the leaguered wall and bristling bank.

* * * * *

No stars peer through the vapours dim and dank,
Which curl in curious wreath. How soon the smoke
Of hell shall pall them in a deeper cloak!"

"Listen to the story of the nightingale! that the vernal season has come; the Spring has formed a bower of joy in every grove, where the almond-tree sheds its silver blossoms. Be joyous therefore, he full of mirth, for the spring season passes away—it will not last.

"Again the dew glitters on the leaves of the lily, like the sparkling of a bright scimitar; the edge of the bower is filled with the light of Ahmed among the plants, the fortunate tulips represent his companions. Come, oh people of Mahomet, this is the season of enjoyment. Listen to me—listen to me! Be joyful, be full of mirth; for the fair season passes away, it will not last.

"Roses, anemones are in the garden, the time is past when the plants were sick, and the rose-hud hung her thoughtful head. Be joyful, be full of mirth—the fair season passes away, it will not last.

"The groves and hills are again adorned with all their beauties, bright and heaving are the flowers, rich and pure is the breath of their lips. Be joyful therefore, he full of mirth; the fair season passes away, it will not last." *

In remarkable contrast to this gladsome exhortation of the Turkish poet, is the "lament" of Scotland's Mary, as she too beheld the "dew glittering on the leaf of the lily," but for her the appropriate resemblance would scarcely be that of the bright scimitar: the many who would gladly have bared their weapons in her cause she knew to be powerless, and "the fair season" was far from "joyous" to her.

The "Lament" is familiarly known, yet there are few, if any memorials on canvas of the moment, one that but too often recurred in her sad history, commemorated by the verses in question.

That the lines are from her own pen adds greatly to their interest, but this circumstance is not their sole recommendation; they have a pathos, a simple beauty, not derived from any extraneous consideration, and which is due to the thought and its expression only. They were written, as most of our readers will remember, when the return of Spring had caused the royal sufferer more than ever to deplore the misfortune of her captivity. The verses are as follow:—

"Now Nature hangs her mantle green
On every blooming tree,
And spreads her sheets of daisies white,
Out o'er the grassy lea.
Now Phoebus cheers the crystal streams,
And glads the azure skies,
But nought can glad the weary wight
That fast in durance lies.

"Now laverocks wake the merry morn,
Aloft on dewy wing;
The merle in his noon-tide bower
Makes woodland echoes ring;
The mavis mild, wi' mony a note,
Sings drowsy day to rest,
In love and freedom they rejoice,
Wi' care nor thrall oppress.

"Now blooms the lily by the bank,
The primrose down the brae,
The hawthorn's budding in the glen,
And milk-white is the slae,
The meanest hind in fair Scotland
May rove their sweets among,
But I, the Queen of a' Scotland,
Maun pine in prison strong."

Touching and beautiful, these lines bring us an exquisite picture of Spring, no less than a moving tale of sorrow. The young artist who shall make them his theme can scarcely fail to produce a valuable addition to our mementos

* The joyous song of the spring-time, given above, will be found in the Turkish of Mesihî; the translation is by Sir William Jones, but the stanzas are taken by the present writer from "The Boatman of the Bosphorus," vol. i., pp. 206 and 236.

of the much-wronged queen: he will give imposing dignity to the fine figure; the delicate face, whose beauty is so familiar to us, shall wear an expression of sadness, yet redeemed from any suspicion of weakness, by the brightly intellectual cast of the lovely countenance. The landscape Mary looks on from her deep oriel window, with such other accessories as he will admit to a place in his picture, will all serve, in their various degrees, to heighten the interest of the work, but this is, of course, chiefly centered on the person of the Queen, at whose feet there is a hound sleeping; otherwise she is alone.

In the fifth canto of the "Purgatorio," and while the Florentine poet, with his Mantuan guide has not yet proceeded beyond the approaches to that place of trial, the former describes the ascent of a mountain, on whose declivities Virgil and himself are surrounded by the souls of the departed; all are advancing, like themselves, towards the "girone" where their appointed probation is to begin.

At a fair height on the mountain are the shades of those who had lived to the end of their days in a state of sin, and were finally dismissed to their account by a violent death. But "having repented at the last moment, and then forgiven their murderers, they were reconciled to God in their death," says the poet.

Among these spirits is that of Buonconte of Montefeltro, of whom Dante inquires wherefore the place of his burial had never been discovered? In reply to this question, Buonconte bids him know that "having expired on the banks of the Archiano, his body was carried into the stream by a flood, on whose waters it was borne to the Arno," where the corpse was lost amidst the depths of that river.

In the course of this relation occur some fine lines, presenting a fair study for the painter. Of the peril that may be mingled with the hope conveyed in the passage, we are not now to speak. The lines are these:—

"Arrivò io forato nella gola,
Fuggendo a piede, e sanguinando 'l piano
Quivi perdè la vista e la parola:
Nel nome di Maria fui, e quivi
Caddi e rimase la mia carne sola—
Io dirò 'l vero, e tu 'l ridi' tra i vivi:
L'Angel di Dio mi prese, e quel d'Inferno
Gridava: 'O tu dal ciel, perchè mi privi
Tu te ne porti di costui l'eterno
Per una lagrimetta, che 'l mi toglie.' *

The lone wild hank of the rushing and foaming river, with the fallen yet still darkly beautiful Spirit of Evil, vainly demanding his hoped-for prey from the radiant "Son of Heaven," within the shadow of whose glittering pinions may be dimly discerned the vaporous presentment of what once was Buonconte. All these may serve to awaken the imagination of the painter, to whom we leave them. A passage from the nineteenth canto has also very tempting elements, and I defer the transcription of the stanzas with regret, but they must, for this time, he resisted, as must likewise an eloquent description—but of somewhat different character—inviting us by the voice of Ariosto. "Not all that is deferred, proves to be lost," however, says the French proverb, and these, that we now reluctantly postpone, may find place some other day.†

* The writer would have been glad to give the translation of this passage by Cary, holding it better to take the maturely considered work of an approved author than his own crude and hasty rendering, *pro re nata*; but failing Cary—not to be obtained at the moment—the following may suffice to give the mere sense to such of our readers as shall prefer to see it in English:—

"Flying on foot, with pain I reached the shore
Of Archiano. In my throat I bore
The deadly gash, pouring a crimson rain.
That, where my faint foot passed, bedewed the plain.
Here speech and sight forsook me, but I cried,
Hopful, to Mary mother ere I died.
Then lay my corpse, all prone and lonely there.
True are my words, do thou their truth declare
To all of mortal race—God's Angel took
My soul, but o'er me hell's dark spirit shook
His dusky pinions, 'Wherefore, Son of Heaven,
Hast thou,' he cried, 'from me my conquest riven?
That soul was mine; yet to the brighter sphere
Now shall he rise, and all for one poor tear.' "

PURGATORIO, Canto Sesto.
† To be continued.

BRITISH ARTISTS: THEIR STYLE AND CHARACTER.

WITH ENGRAVED ILLUSTRATIONS.

No. XIII.—CHARLES ROBERT LESLIE, R.A.*

LESUMING our catalogue *raisonnée* of the works of Mr. Leslie, at the date where we were compelled to leave off in our last publication, we find that in 1850 he exhibited three pictures;—"Beatrice," a lovely young girl looking over a balustrade into a garden; an incident from the "History of a Foundling," "Tom Jones showing Sophia Western herself in a glass, as a security for his good behaviour;" and "Queen Katherine of Arragon giving her dying charge to Capucius," from "Henry VIII.," a composition evidencing much profound thought and tender feeling.

Of two pictures exhibited in 1851, one was a small half-length figure of a lady, entitled a "Study;" the other, "Falstaff personating the King;" the interest of this work is exclusively maintained by the figures, and in these the artist's genius in the impersonation of character has nowhere failed; the whole *dramatis persone* in the scene are admirably put on the stage; Falstaff especially is inimitable; the picture has few accessories to distract the attention of the spectator from the "players."

Mr. Leslie's solitary contribution to the Academy in 1852 was a small half-length of "Juliet" examining the draught given her by the friar; the face, on which the light falls brilliantly, is highly expressive of misgivings and anxious thought. The year 1853 brought nothing from the painter; but in 1854 we had "The Present," another half-length of a young lady (possibly intended as a *pendent* to the "Juliet") examining a locket; a portrait of a lady; and a scene from the "Rape of the Lock," Sir Plume demanding the restoration of the Lock. The remarks we made on this picture are of so recent a date, that we find it unnecessary to do more than just quote the concluding paragraph of our criticism:—"The forms and faces are graceful and beautiful; the story is admirably told;

and if we object to the picture as *weaker* than his earlier works, our objection is merely to the execution; the pure and high feeling of the artist is here as fresh as it was in the vigour of his youth. We doubt, indeed, if he ever produced a picture better than this in all the loftier essentials of Art."

Sancho Panza is one of the first names with which the pictures of this artist are identified; so is it also the last of which we have now to speak—"Sancho and Dr. Pedro Rezia," being the subject of the only painting exhibited by Mr. Leslie last year; though, as was remarked of his "Sir Plume," it is somewhat "slight in manner, it has otherwise all the clearness and precision of the best of the painter's works." There is, however, one picture by him too important to be omitted, the "Christening of the Princess Royal;" it was never exhibited; but as it must be well known from the large engraving published from it, it may be passed over without comment, though deserving of high praise.

Such is a summary—and nothing more—of the principal labours of forty years devoted to Art: they show but little in our narrative; yet who, save the artist himself, or those similarly circumstanced, would attempt to measure the study, the toil, the deep and anxious thought such labours must have cost? Mr. Leslie seems never to have considered *how many* pictures he could get ready for the "opening-day,"—at no time, if we recollect rightly, has he exhibited more than four, and rarely above three—but what those should be which he was preparing; and hence there is scarcely a single work he has produced that does not present indubitable evidence of the intelligent *mind* that wrought it. As a painter of dramatic subjects he is unrivalled; his characters all stand out with an individuality and a truth which cannot be surpassed; they are living portraits of the men as the poet or the novelist drew them, not mere artist's fancies, while at the same time he invests them with the poetry of his art. His pictures are to be read and studied; they are not meant for gewgaw ornaments on the walls of a richly-furnished drawing-room—the gold and the crimson would out-dazzle those unobtrusive canvasses that speak so quietly, yet eloquently, the language of the painter's art. "The most poetic of the painters of domestic; one of those who have attained the highest excellence without (to this day) having paid a visit to Italy—though an intelligent and catholic appreciator of the works of his predecessors in the art—his style is individual and English, and has been one of progressive excellence. . . . Competent judges pronounce him to have succeeded—in a 'modest' manner of his own—in whatever he has undertaken. His art is as refined as it is unconventional."* The highest qualities of Mr. Leslie's style are

LADY JANE GREY ENTREATED TO ACCEPT THE CROWN.

[J. & G. F. Nicholls.

character and expression; these are 'always appropriate' to the subject: his drawing is good, correct, graceful, and unmechanical; the execution, in general, very careful, and not deficient in power; as a colourist he is unequal, often rich and harmonious, occasionally cold, crude, and heavy: he seems to us to work on different principles at different times, as if he had no definite theory of his own; but this must be an impossibility to one who has so long and so successfully practised.

As we are always gratified to find our own opinions expressed or confirmed by other critics, we reprint what another writer said many years

since about the works of this painter, the truth of which all Mr. Leslie's subsequent productions amply bear out:—"In his general perception of females, Leslie always invests them with more of the mental than mere physical beauty, and gives them an air of noble and dignified deportment." This is perhaps especially conspicuous in the females introduced into his pictures of "The Duchess and Sancho." "Nor are his men deficient in all the elevated qualities of their sex; and for real humour and quaintness we have shown that in his Sancho Panza, Uncle Toby, and Tristram Shandy, he is perfectly original in their delineation; and one of Leslie's

* Continued from p. 75.

* *Men of the Time*. D. Bogue, 1856.

most admirable characteristics is, that he can most truly and graphically develop the plot and meaning of his compositions with comparatively few figures. He never has recourse for the mere sake of effect to overcrowding his compositions with a multiplicity of figures. In sentiment Leslie is truly poetical; there is no affectation of it, as if it came second-hand, but appears the pure effusion of a highly gifted mind. The graces of his females are not borrowed from the stiffened artifices of drawing-rooms, nor the dignity of his men from the skill of a tailor; they are derived from nature alone, where is to be seen the true aristocracy of mind."*

Several of Mr. Leslie's pictures have, as we have already stated, been engraved on a scale of considerable magnitude; and when the "Annals" were in full bloom, many of the best prints which ornamented them were from the productions of his pencil.

Having thus considered, however imperfectly, Mr. Leslie in his character as an artist, it remains for us to add a few words about him as a writer upon Art. It has often struck us as something remarkable in the annals of Art-literature, how very few of those whose pencils prove them

to be men of superior intelligences ever give their thoughts to the world through the medium of the pen; they either cannot, or will not, write: a large number cannot, nor is it to be expected; but very many can, and yet do not. Who ought to be so well able to enlighten others in these matters as they who have made them the study of their lives? Not to go beyond the painters of our own school, how limited is the number of authors which it includes: Reynolds, Barry, Opie, Fuseli, Phillips, published their lectures delivered in the Royal Academy, but these can scarcely be regarded as voluntary contributions to the literature of Art; while of the many living painters, we can call to mind only Sir C. Eastlake, Leslie, J. Burnet, J. D. Harding, and Pyne in the columns of the *Art-Journal*, who have taken up the pen to become teachers. In no other profession is such a dearth of writers to be found: in the church, in the army and navy, in law, in medicine, authors are numerous enough, affording abundant information to their professional brethren as well as to the public generally; so too has architecture. Painting and sculpture alone have to depend, generally, for their exposition, upon the amateur: it is a pity it should be so, but we fear there is little chance of its being otherwise.

THE RIVALS.

[J. & G. P. Nicholls.

In 1845, Mr. Leslie published a "Life of Constable," "a genuine and unaffected piece of biography," and a worthy tribute to the memory of that great landscape painter: we quoted at some length from it in our notice of Constable's works last year. In 1848 he accepted the office of Professor of Painting at the Academy, which he retained till 1851, resigning his post, chiefly, we believe, on account of the delicate state of his health, to its present occupier, Mr. S. A. Hart, R.A. The lectures delivered by Mr. Leslie to the students were published last year under the title of "A Handbook for Young Painters"†; we noticed the work when it appeared last year, but the present opportunity enables us to refer to it again.

While reading over these lectures a second time, we thought it not improbable there would be found in them something affording information on his principles of colouring, but we discover none; and it is somewhat singular that a painter who entertains so high an opinion, as Mr.

Leslie does, of the importance of colour, and who is so ardent an admirer of the school of great colourists—the Venetian, should so frequently have adopted almost the very opposite: he acknowledges the deficiency, if we may employ the term, and also the difficulty that lies in the way of any painter excelling in this quality. "It was, perhaps, very much from modesty that Reynolds placed the things he so greatly excelled in lower than I think they should be placed among the attributes of Art. It was natural that he should not think the most highly of what he found so easy; but as I have not the same reason for undervaluing colour and *chiar'-oscuro*, I will endeavour to show why I venture to dissent on those points from so high an authority. * * * It is a fatal error to believe that Colour is a matter of more easy acquirement than Form; I conceive it to be far more difficult. Form may be measured; its anatomical structure may be investigated, its lines are not changed, as tints perpetually are, by the shifting light of day or the accidents of reflexes. If the beauties of form are subtle, those of colour are evanescent; and, combined with *chiar'-oscuro*, from which, in nature, they are inseparable, they become the last refinements of the Art, as it addresses itself to the eye.

"It must be remembered that, at the present day, there are greater

* Arnold's "Magazine of the Fine Arts." 1834.

† "A Handbook for Young Painters." By C. R. Leslie, R.A. J. Murray, London, 1855.

obstacles in the way of becoming colourists than existed in the infancy of Painting. The discovery of chiar-oscuro has much increased the difficulties of colouring; and unfortunately, ever since the time of Raphael, indolence in a study so difficult has been able to shelter itself under the example of him who was indolent in nothing that belonged to the Art."

The following truthful remarks ought not to be lost on some of our young artists, whose great fault is that they are always looking at one or another of the leading men, whose style they are desirous of imitating because it has become popular.

"The minds of students are much more impressed, in the commencement of their studies, by the productions of their contemporaries, than by the works of the old masters, and these early impressions are not always wholly eradicated through the longest life. There may be seeming exceptions to this, but I believe there are very few real ones. That contemporary Art is the first to impress us may be advantageous, or otherwise, according to circumstances. Its advantages need not be dwelt upon, as such influence stands in no need of recommendation; but it may be useful to point out some of the dangers of what is an unavoidable, because an unconscious, habit of our students, the habit of resorting to our annual exhibitions as to so many schools.

"In an assemblage of the incidental productions of a year, and with which it is necessary to cover every inch of wall,* there must of necessity

be a great preponderance of the indifferent, and very much of what is positively bad; and inexperienced eyes cannot dwell often and long on this without injury. The student is apt to thank his stars that he can do better than much that he sees, and contents himself with respectable mediocrity; and the more so as it is found that mediocrity, managed with ordinary tact, may secure patronage and even fortune, while unworldly genius is often neglected. There are no topics more frequently dwelt on by writers and talkers than the faults of the age—and yet nothing so difficult to understand. But to the young artist it is of the last importance that he should see clearly what are the besetting sins of the school to which he belongs. These, it is very true, are to be seen in their fullest luxuriance in our exhibitions; but there is danger if the student resort frequently to them for instruction, that he may become hopelessly blind to the mannerism of the day; and indeed this error in self-education is the chief cause of the decline of Art in every school."

Mr. Leslie's opinions upon High Art harmonise with those we have frequently expressed:—"Englishmen," he says, "are constantly told by foreigners, and are constantly telling themselves, that High Art has never existed in England. True it is, there has been no British Michael Angelo, or Raphael, any more than there have been painters approaching to them in the modern schools of Italy, France, Germany, or Holland. But the Art of Hogarth, of Reynolds, of Gainsborough, of Wilson, of Fuseli, of

SANCHO PANZA AND THE DUCHESS.

[J. & G. F. Nicholls.

Opie, Stothard, Turner, Constable, Wilkie, and of Etty, and the Art displayed in Haydon's 'Judgment of Solomon,'—what are we to call it?—I care not what, but I will say that, out of Great Britain, nothing so *high* has been produced since the death of Watteau; whose Art, distinct from its subject, is of the highest order.

"Latterly, the term 'High' has generally been exchanged for 'Religious,' which means Art of which the subjects are from the Bible or the Legends of the Church. I should make no objection to the definition as a matter of convenience, and if understood no otherwise than of Art of which the theme is religious. But, I fear, it is too much received and intended as defining a style necessarily differing from other styles.

"It is clear to me, that had any of the early Christian painters descended to subjects of familiar life, their treatment would not, in principle or in execution, have differed from that in their religious pictures, for in that of their portraits it did not. I think, therefore, that the

attaching of more importance than they deserve to such definitions as *religious Art* and *religious painters* is calculated to blind us to many of the beauties of nature, and to lead us to suppose that because, by the early masters, some of her grandest and most charming qualities were unperceived, they are inconsistent with religious feeling; and that there must be a marked difference between religious men, women, and children, and the rest of the world; and that even skies, trees, fields, rivers, and mountains may become religious, and therefore sublime, by their unlikeness to Nature. *Severe* is a word sometimes used, and I have also heard of *heroic* landscape. Such classifications are calculated to mislead the young, while they may be easily taken advantage of by the indolent and cunning, who, with little study or thought, may at once put themselves forward as religious painters, by some mannered deviations from Nature."

Mr. Ruskin, and the pre-Raphaelite school, will scarcely share in this opinion, nor in others of a similar nature contained in the volume.

It would be a very easy matter to cull from Mr. Leslie's "Handbook" many passages similar to those extracted, either as examples of his theories of Art, or of his critical remarks upon the works of other painters: we have, however, shown enough for our purpose, and as much as our space will allow, and must therefore take our leave of him with the expression of an opinion, that both as an artist and a writer upon Art, he is one of whom the British School has full reason to be proud.

* We must take the liberty of differing from Mr. Leslie on this point; we think no such necessity really exists, and that it would in every way be far better to exclude many pictures that are hung than to admit them. In the first place they are useless where they are often hung, except, as Mr. Leslie says, to "cover the walls"; and secondly, the placing these pictures out of sight creates endless heart-burnings, which often terminate in indifference or disgust. It is our conviction that such admissions are neither profitable to the artist nor welcome to the public.

WINCHESTER COLLEGE.*

THE lives of the great and the good, of the men who made their brief sojourn in the world useful in "their day and generation," are always studied with pleasure and advantage; but how much greater and nobler is the record when devoted to the life and acts of one whose benevolence has very long outlived his age, but which still flourishes after five centuries have nearly elapsed, surviving all changes of time, creed, and manners, and blessing the present age as it has blessed the past? Such a man was William of Wykeham, and thus lasting has been his enlarged views and pious benevolence. More enduring than thrones and kingdoms, his collegiate foundations still bless our land; and while the record of conquerors becomes a schoolboy's task, he seems to live among us still, dispensing learning and charity as in his own day,

"Only the actions of the just,
Smell sweet, and blossom in the dust."

Irrespective of the gratitude which all Englishmen owe to this prelate as a national benefactor, his life presents other claims to their attention. He is a glorious example, added to the numerous others it is our boast to show, of men who by intelligence, truthfulness, and perseverance, have raised themselves from the lowest grade to the highest in the land. William of Wykeham was the son of a simple yeoman, and born in the early part of the fourteenth century, a period when the rights of the commonalty were little understood, and still less cared for; when the old feudal laws were in full operation, and the

ARMS OF WYKEHAM.

difficulties which beset the upward path of the son of poor parents infinitely greater than we can now understand. Young William doubtless soon showed the bent of his mind, and a tendency to the books of the priest rather than the barn of the labourer. His assiduity in study attracted attention in an age when it was rare, and rarer still among his own class, so that the lord of the manor of Wykeham, Sir Nicholas Uvedale, desired his services as clerk. Sir Nicholas held the offices of Lieutenant of Southampton, and Governor of Winchester Castle, and when the young man grew to be his secretary, his tact and ability in writing to the nobles and the king promoted him to the same office in the household of Bishop Edyngdon, of Winchester.

At this time Wykeham was in good reputation as an architect, and certain repairs and alterations made in Winchester Castle, then a royal residence, introduced him to the notice of King Edward III., who on his return from the taking of Calais, made a sojourn there. At this time William was but twenty-three years of age, but the king saw in him the man he needed, and henceforth his rise in the state was sure though gradual. He directed his attention still more to clerical studies, and the king conferred, two years afterwards, his first benefice upon him. In those days, when the church was all-powerful, and numbered amongst its sons all the professors of the liberal arts, the ability of Wykeham as an architect added greatly to his chances of position

among his fellows. To record his steady rise in temporal and ecclesiastical power would occupy too much of our present space. Suffice it to say, that he became one of the greatest men of his age, the chancellor of the king, and the benefactor of the poor, dying, full of years and honours, September 27, 1404, at the age of eighty years; he was buried in the cathedral of Winchester

which he had loved so well, and decorated so liberally.

It is no small privilege to be the historian of such a man; to feel called upon, after five centuries have experienced the benefit of his wisdom and charity, to narrate the rise and power he possessed, and how well he used it. With Mr. Walcott this has evidently been a labour of love,

WATER MEADS, WINCHESTER.

yet done with discriminating taste. He speaks of the great churchman justly when he says:—"With a lofty genius, capable of planning and achieving mighty things, set in high places the most seductive to the enterprising mind, the wise head and sound heart of Wykeham neither grew confused, nor yielded to temptation;"

hence he has won this due eulogium, and, our author observes, "his greatest praise is, that he will be remembered as one of the best known of Christian bishops in any age, the mild benefactor of his country."

With the innate nobility of a truly great mind, Wykeham never forgot his early days and their

LIBRARY DOOR, WINCHESTER COLLEGE.

associations, and the experience gained in his passage through life, he treasured up as hints for doing good, where good was needed to be done. With him Christianity was an active principle, not bounded by ecclesiastical routine, but spreading forth in general benevolence. His corn was not only garnered, but sent forth as

seed for abundant future crops, and the present age is now gathering the harvest he sowed. "He believed himself God's almoner," says Mr. Walcott; "he gathered only to spend for the benefit of his fellows. Selfish motives and temporary ends he cast from him; he is one whom England should look upon with a sacred love, and whose

* WILLIAM OF WYKEHAM AND HIS COLLEGES. By MACKENZIE E. C. WALCOTT, M.A. Published by D. NUTT, London and Winchester.

memory she may take home to her heart without reproach or fear."

Well might Wykeham take for his motto the expressive words, "Manners makyth Man;" without patrimony or inheritance, his own pains, fidelity, and unwearied industry, had been his only recommendation to the favour of princes; nor did he falsely feel shame to remember it. "As appears from his seals, upon his accession to the episcopate, he still used two chevrons between three roses (the chevron, or carpenter's couple, as Nicholas Upton, the herald, wrote, being 'signum per carpentarios, et domorum factores portatum'), in allusion to his knowledge of architecture, to which he owed his rise and fortune." To his unceasing efforts in designing and rebuilding his cathedral at Winchester, the architectural student owes a debt of gratitude,

WYKEHAM'S ARCHIDIACONAL SEAL.

but his great educational foundations, the colleges at Winchester and Oxford, demand here a few words.

Oxford, in the time of Wykeham, had sunk low; poverty, neglect, and pestilence had done their work; silly disputes between the academicians and friars abounded. The prelate brought an enlarged mind to bear on the reform of education. He founded New College in that city, and in such a manner that his rules show a degree of enlightenment much in advance of his age. In Winchester he founded the College of St. Mary, to act as the nursing mother of the Oxford institution, and which still subsists as flourishing as if the good bishop was yet bestowing upon it his fatherly care.

Winchester College occupies the spot where stood, in his days, a small decayed grammar-

WYKEHAM'S PRIVATE SEAL.

school, built upon the ruins of a Roman Temple to Apollo, and here, they say, our great King Alfred studied. The early associations of Wykeham were connected with the building, and he determined to found a new and more useful school there. How he did this must be told by Mr. Walcott, and to his pages would we refer for much pleasant reading thereupon. What he did still remains, and it is well worth the trouble of a journey from busy London to view

"the calm sequestered shade"

of the cloistered walks, the noble chapel, and the peaceful home good Bishop William has left for scholars. The pleasant meadows near the heights of St. Catherine, the old Hospital of St. Cross, are all happy spots in close vicinage, and the heart must be cold indeed that can stroll

around Winchester, the courtly home of our Saxon kings, without grateful feelings toward the illustrious departed!

Beneath the spot where the school-boy prayed, the honoured prelate sleeps. His effigy lies, says Mr. Walcott, "upon a raised tomb of alabaster, beneath the lofty vaulting of a chapel rich in carved work; it is the figure of a peaceful

slumberer, in his holy robes, the mitre on his head, the staff by his side, his face turned heavenward, and his hands joined in prayer across the bosom, concealed by purple folds. The lines of thought, the lineaments of high resolve and noblest courage, are imprinted on the pale countenance; good angels watch around the head; at the feet are seated children, in the

THE CLOISTERS OF WINCHESTER SCHOOL.

dress of his students, with loving faces, praising their benefactor."

One poetic custom—a tradition of old times—still exists among the scholars; it is the singing of the noble old chaunt *Dulce Domum* a few weeks before holidays. The old tradition asserts it to be the remembrance of the fate of a scholar

in the olden time, who was kept fastened to a pillar at school during the vacation, while his happier school-fellows were at their homes. Before they had returned, their unfortunate school-mate had sickened and died.

We have already said that Mr. Walcott brings due enthusiasm to his task, and the result has

VIEW FROM THE WARDEN'S GARDEN, WINCHESTER.

been a work elevated above the ordinary dry reading such books almost invariably present. The volume is elegant, also, in its "getting up," and is enriched by many excellent architectural engravings on steel, and several tasteful woodcuts, of which our present pages exhibit specimens. To Wykehamists—as our author delights

to call the students of his colleges—it must be a very acceptable volume; but it has claims on all who take interest in our educational foundations, as the true source of the intellectual greatness of the country; or who desire that noblest of instruction which all may gather from the life of a good and truly noble man.

THE HOME OF PAUL POTTER.

BY F. W. FAIRHOLT, F.S.A.

WITH ILLUSTRATIONS FROM ORIGINAL SKETCHES
BY THE AUTHOR.

THE Hague has always been considered the most aristocratic and pleasant of Dutch towns. Its old name, Gravenhaage, indicates its position as the boundary of the principality of the ancient Counts of Holland. Its pleasant and healthy position gave it an advantage over most other towns when Holland became a kingdom, and it was chosen as the residence of the court. Its close proximity to the sea, the healthy character of its location, and the fresh beauty of the wood which for ages was allowed to grow as nature pleased in its close vicinage, were all charms uncombined elsewhere, and "*les délices de la Haye*" were spoken of even at the court of Versailles. The palace of the Stadtholder was here, and the picturesque pile of building used as the town-hall was the scene of many an event and discussion vital to the interests of Holland, in an age fruitful of great events to that country, whose annals possess an interest second to those of no other modern European state. It would almost be expected in the nature of things that the marshy tract of unproductive sand which forms this country, would be left to the quiet possession of the industrious people who had with such unwearied assiduity reclaimed it from the sea. Scarcely would it be possible to mark out a place in the old maps of Europe less attractive for the foundation of a settlement, presenting greater difficulties to be overcome, and demanding more constant care to preserve when these difficulties had been conquered. It was rescued from the sea only to be reclaimed by it upon the slightest relaxation of vigilant watchfulness,—but the fear of encroachments from their natural enemy was as nothing to the native Hollanders, compared to those which had menaced for many centuries their civil and religious liberties; and the records of no country present more noble instances of unflinching patriotism and bold love of liberty than theirs do, when its sons were vindicating for its unwholesome swamps the only attractiveness they could ever possess, the consciousness that it was the country of free men.

We have already noted, in the lives of Cuyp and Rembrandt, the quietude with which their days passed amidst the din and bustle of an age of political and religious warfare. In Paul Potter we have another instance of this mental abstraction, which could allow the mind to be withdrawn from the ordinary doings of the world, to pursue a calm course of its own, achieving its own greatness by a placid energy which could not be turned aside from its goal. His life was a short one, but he employed his brief sojourn most earnestly in the study of Art through Nature. He won, and will ever hold, an undying name as its true exponent, while his works increase in value as time adds to their years, and true criticism advances our knowledge. Thus the painting which delighted at first as a simple transcript of nature, becomes, as we study it more, like nature itself—a hidden mine of poetry, awaiting the research of the earnest student who will seek to discover it.

The Hague may be considered as the "home" of Paul Potter, in the best sense of the word—that sense which makes the word convey to the mind all that is genial and lovable, and that marks the happy residence where intellect expands itself freely, and attaches itself fondly to the place of its growth. Though Amsterdam was the city of his early days, the Hague was the home of his choice, and his happiest years were passed within its boundaries; or in wandering beneath the shade of its neighbouring wood; or seeking subjects in the fertile fields of its vicinity. His desires and wants were bounded by this simple practice, and his native genius could elevate all he saw so readily and well, as to insure a place of honour on the walls of a palace to the simplest rural scene Holland might offer to his inspired pencil.

Potter was born, in the year 1625, in the town of Enkuisen, where his father practised Art, but

ranked low as a painter. His ancestors had held honourable posts in that city, and were descended from the noble house of Egmont. Soon after his birth his father went to Amsterdam as a permanent residence, and here he taught his son all that he knew of the rudiments of Art. He never had another master, nor did he seem to want one, for his own genius did for him what no master alone could effect; and at fourteen years of age his great ability as an artist was

acknowledged; but he felt the trammels of home life, and left it soon afterwards for the Hague.

Holland at this time had declared itself free from foreign yoke; the tyranny, falsehood, and cruelty of Spanish rule had been effectually opposed, even to the partial destruction of the country, and a brighter day dawned on its brave people.* Spain had become weakened in its resources, Germany was torn by religious wars,

A DUTCH SEA-PORT: 1635.

France was the ally of Holland, while England was busied with its own great civil war, in determined opposition to the encroachments on its liberties made by Charles I. Holland at last held a proud and independent position under its Stadtholder, Prince Frederick Henry. By land its arms had been successful, but at sea they were glorious; and the brilliant victory of

Van Tromp, known by the name of the battle of the Downs, from having been fought off the coast of England on the 21st of October, 1639, raised the naval reputation of Holland to the highest point. The trade of the country had steadily increased, and the distant settlements of Brazil and Batavia, as well as the enormous trade with the East and West Indies, enriched

AMSTERDAM IN 1639.

the merchantmen of the land immensely. Although taxation was enormous, and its national debt excessive, the country enjoyed great wealth and power, and the taste for pictures and the luxuries of life increased greatly.

The prospects of Potter were therefore good; and the objection made by the rich architect, Balkenende, when he asked his daughter in marriage, that he was "only an animal-painter," and ineligible for such an honour, was soon removed by the patronage so profitably enjoyed by the young artist; at the age of twenty-five,

Potter therefore married his daughter Adrienne,

* The great dykes, upon which the very existence of the country depends, were cut in many places to submerge invading armies; and at Leyden, during the memorable siege in 1575, the sea flowed up to the walls of the town, destroying above one thousand Spanish soldiers, the inhabitants sallying out in boats, and continuing an amphibious combat with others who had ascended trees. The whole country for 20 leagues around was ruined for agricultural pursuits for many years. Indeed, during these wars, it became almost reduced to its original state—a tract of waste mud, sand, and stagnant water.

a somewhat gay and flighty young lady for a Dutchwoman, and settled himself in one of the best houses of the town, which was soon frequented by the principal men of Holland, who deluged the painter with commissions, which he executed with untiring energy and comparative ease, because he had in the close vicinity of his home an abundant field of study, and his favourite flocks and herds were ever near him in infinite variety.

The rich character of the vegetation in Holland is due to the irrigation the soil so continually receives. The whole country is a network of canals, but it is in "the Polders" that the greatest fertility is seen; this is a technical term for a tract of ground which has been once a morass or lake, below the level of the sea, but which has been reclaimed by clearing away the water. The great lake of Haarlem has recently been converted into most profitable garden and pasture-land in this way. This is done by the simple process of forming a raised bank all round the lake, to prevent water from flowing into it. A series of windmills, each working water-wheels, is then erected on this dyke to pump the water upward into a canal on their own level, from whence it is drained off into the sea, or lifted into a series of higher canals by the same wind-agency. Thus we find sometimes three or four stages of canals used to lift the water to a proper level for drainage. The fertile soil which forms the bed of the Polder is laid out into a series of fields in the form of parallelograms, each separated on all sides by a deep ditch, the waters in which form the only means of communication with the fields, and render other guard over cattle unnecessary, as they cannot roam from the confined space allotted to them. The small ditches are continually kept to a proper level by the industrious water-mills, and the canals thus filled communicate with the others which intersect the country, and give water-way* for commerce of all kinds, and the supply of the markets. Thus a very large pastoral portion of Holland is artificial, and requires constant watching; the least neglect or inattention might prejudice much property, and ruin an agricultural district.† It has been well observed that "the inhabitant of the provinces bordering on the sea, or the Rhine, constantly threatened with the danger of submersion, is not more secure than he who dwells on the side of Etna, or at the foot of Vesuvius, with a volcano heaving beneath him. A stranger can have a full impression of this only when he walks at the foot of one of these vast dykes, and hears the roar of the waves on the outside, sixteen or twenty feet higher than his head."‡ In the days of Potter the system of perfect drainage now seen in Holland had not been introduced; the small streams were allowed to flow and spread lazily over the land, and the engraving we copy of a Dutch seaport, from the curious "Book of Emblems," by I. Cats, published at Dort in 1635, gives an excellent idea of this. The sluggish stream which flows from the village inundates the fields irregularly, and men are employed in marking its boggy boundaries by warning-posts. The sea-wall for the protection of the port, formed by the stems of trees, stretches far away, and makes an agreeable promenade. These ramparts are generally formed of clay, their surface sometimes being protected by wicker-work of willow-twigs, which, as they perish in the course of three or four years, require to be

* This simple and convenient mode of transit is abundantly adopted in Holland. It suits the quiet habits of the people best, to glide leisurely over the canals from town to town in the *treckschuit*, or passenger-boat; it is also a communication which improves in winter; for at that season the whole population don their skates, and travel with great rapidity over the ice, which gives continued connection all over the country. Market-women will carry their wares an incredible distance in this way.

† So short a time ago as the year 1825, the whole of Holland was in great danger from the quantity of water which rushed from the mouths of the Rhine and Meuse, and the extraordinary height of the tides. It is declared, that had the sea continued to rise but *one quarter of an hour* more, the great dykes which protect Amsterdam would have overflowed, and that city might have been ruined. As it was, it occupied more than two years of incessant labour to repair the damage done.

‡ The coat of arms of the province of Zealand fancifully alludes to the geographical position it holds, and consists of a lion half submerged in the waves, with the motto, "*Luctor, et emergo*," I struggle to keep above water.

constantly watched and renewed. The base, if not protected by piles, is generally faced with stones, or walled with hard-baked bricks, called *clinkers*, while rows of piles form breakwaters as a further protection to their solidity. Thus continuously has the Hollander to labour in the preservation of his country, and nowhere is in-

dustries so strikingly visible as among the Dutch; for it meets the eye continually, and challenges observation everywhere. The ground beneath the feet is "made earth," to use a gardener's term; sometimes brought from considerable distances, and only preserved from being washed away by the embankments just alluded to. This

TOWN HALL, THE HAGUE.

necessary attention to the state of the land produces an extremely *artificial* look over its entire surface. It seems as if the whole country had been constructed by human labour; more particularly as the Hollander scarcely allows a blade of grass to grow freely—all is trimmed and tended with care; while bushes and shrubs

are subjected to the gardener's shears, and cut into those wonderful figures of birds and beasts occasionally to be seen in quiet English villages, where Dutch taste has penetrated. Even large trees occasionally assume the form of square masses of foliage supported on naked upright stems, or else are tortured on iron frameworks

A DUTCH POLDER.

till they look as little like trees as a Chinese lady's foot resembles that of the Venus de Medicis.

In Holland the laws of nature seem to be reversed; the sea is higher than the land—the lowest ground in the country is 24 feet below high-water mark, and when the tide is driven high by the wind, 30 feet! In no other country do the keels of the ships float above the chim-

neys of the houses, and, nowhere else does the frog, croaking from among the bulrushes, look down upon the swallow on the house-top. Where rivers take their course it is not in beds of their own choosing; they are compelled to pass through canals, and are confined within fixed bounds by the stupendous mounds imposed on them by human Art, which has also

succeeded in overcoming the "everywhere-else" resistless impetuosity of the ocean. In a very extensive range of the country there is not a stone or pebble to be found in the alluvial or sandy soil; and there are no hills, save such as are raised by the winds; unless, indeed, we take into consideration those vast artificial mountains of granite which have been brought at enormous expense from Norway and Sweden, and sunk under water to serve as barriers to the sea. Excepting the eastern provinces, the parks of Haarlem and the Hague, and the avenues leading from one city to another, the land does not produce much wood; but then entire Norwegian forests have been buried beneath the mud in the shape of piles.*

It is in some degree surprising that so pure and good a school of natural Art should have been formed by its native-born painters, and still more remarkable that men thus compelled to see only conventional views of her beauties, should look upon the goddess dressed in Dutch taste, but delineate her in all the freedom of the purest innocence and simplicity. We might have expected a sort of Chinese landscape painting to have predominated, and cattle to have rivalled in pictures the productions of their own pottery at Delft; but the painters of Holland never committed this error, they seem

to have avoided with scrupulous care any other than the purest features she presented to them. To them she denied her grander traits—the rocky beauties of Switzerland, or the verdant graces of Italy. With them the all-glorious Rhine became a flat heavy stream, pouring its many mouths to the sea in a swamp of mud; yet limited as the field of native Art thus necessarily became, the Dutch artists, by their unweary study of nature, and profound and patient delineation of its most minute characteristics, founded a school at once original and excellent.

Among all their national painters, none held higher rank than Paul Potter, whose finest work, "The Young Bull," still decorates the public gallery of the Hague, the favourite residence of the painter, the scene of his studies and his triumphs, but wanting, alas! in the greatest joy of all—domestic felicity. His wife was fond of flirtations which gave the peaceful painter constant uneasiness, and to such an extreme was this at last carried, that the artist one day caught his wife listening to one of her admirers; when enraged beyond measure, he cast over them the net-work he carried on his arm; and which he had taken from his horse, who wore it to keep off the flies; then tying them together with it, he exposed them both to the laughter of

the habit of painting, and he was anxious that size should be no bar to his success. The life-sized pictures of animals he now painted, although characterised by vigour and truth of touch, lose greatly in interest and beauty by their gigantic proportions, and the celebrated bull at the Hague disappoints at first sight, while few would wish to possess it in preference to his less obtrusive works. But to whatever scale the artist worked, he was always the captivating exponent of simple nature, and gave a truth, and a life, and a poetry to his scenes, which elevate the commonplace to the classic.

An early death awaited the artist; he had not completed his twenty-ninth year when he expired of a decline; leaving behind him the wife he fondly loved, in spite of her blameable levities; and a little daughter three years old. In the great chapel at Amsterdam lie the remains of this one of the greatest artists of Holland;—the painter reposes in the very reverse of the quiet scenes he loved so well to depict. All around it is the bustle of life, the throng of commerce, the din of busy feet. The quaint and characteristic steeple peeps over tall warehouses, surrounding busy docks where produce is unladen from all quarters of the world. You cannot rest on the bridges which span the canal to reflect on the mausoleum of the painter, for the heavily-laden cart is constantly moving with merchandise, or the quaint old coach almost noiselessly sliding on its sledge in place of wheels, might too dangerously disturb your reverie. There is something incongruous in seeking the grave of the pastoral painter in such ungenial scenes; and in the very midst of "life's fitful fever" to find the grave of one who revelled in "fresh fields and pastures new"; who studied them with a poet's love, and delineated them with the highest artistic power; whose whole soul was imbued with a love of nature, and whose head should have slept where trees shadow and flowers garnish the sod; pastoral life smiling around the resting-place of its truest worshipper.

An artist like Potter is a *creator* of a style; his genius enables him not only to delineate what he sees, but to express the hidden sentiment which gives the charm to nature itself. He has gone below the surface. He has been thus contrasted with painters of his school by a modern critic: "Others have painted cows, oxen, well-drawn sheep, all well-coloured and painted. He alone has seized their expression, the physiognomy of their inner existence, of their instinct. We admire the flocks and herds of Berghem, of Van der Velde, of Karel Dujardin; we are touched by those of Paul Potter."

It should ever be remembered that it is to the artists of Holland we owe a relief from the trammels of the mere "academic" school. It is to their love of nature, and persevering study of her beauties that we are indebted for a purely natural series of pictures, which rely alone for immortality on their true reflection of her varied beauties. The world as it lay around us was long a book unstudied in the flights of fancy after the ideal. To them was given the power of discovering the gold that is hidden amid the dross; the poetry that is in humble nature; the sentiment that lurks beneath the simplest form. They created therefore a new School of Art, and a school which might successfully appeal to all, by the simplicity of its sphere of action. The minute traits of nature in their pictures resemble the charming traits of her features which delight us in the poetry of Shakespeare or of Burns. As the "lush woodbine" or the "mountain daisy" could gladden the hearts of these noble poets into song, so the changing aspects of the sky could elevate into grandeur the simplest elements of Rembrandt's pictures, and the level meads and happy cattle of Paul Potter give a sentiment of happiness to the spectator, like that felt by Goethe's "Faust," when, tired of all the artificial glories of life, he feels his loftiest emotions arise from the contemplation of the fertile fields and happy peasantry around him. Truly has the bard of Avon declared

"One touch of Nature makes the whole world kin,"

and while this cosmopolitan relationship exists the Dutch painters will find admirers.

THE GREAT CHAPEL, AMSTERDAM.

the friends in his house. So ridiculous and disgraceful an affair soon became the talk of the town, and at last grew to be so disagreeable as to oblige the painter to remove to Amsterdam.

It was in 1652 that the painter settled in that city. The Burgomaster Tulp was his great patron, and enriched his fine gallery with the principal works of the artist. Amsterdam was at this period one of the wealthiest of European cities, and its rich traders delighted in embellishing their houses with pictures, carvings, and the rarest and most costly works of India, China, and Japan—a taste which has survived to the present day; and nowhere is so much of the finest work of this kind to be seen as in Holland, while rare old china is in the dealers' shops as common as Staffordshire ware among ourselves. The noble old houses of Antwerp, constructed by the De Ruyters, the Van Tulps, and the rich burghers of old days, still stand to attest their wealth and magnificence; but if we would see the city as in the days of its greatest glory, we must turn over the pages of the chroniclers of its great public events. There is a magnificent volume devoted to a detail of the reception given by the city to Catherine de' Mediceis, embellished by the most minute and beautiful engravings by Savery, and we have selected a view on the grand canal from this rare volume, to illustrate

the Amsterdam of Potter's era.* The view comprises a group of imposing houses, intersected by smaller canals, over which miniature bridges are carried, and it gives an excellent idea of the characteristics of one of the most extraordinary cities of Europe. Some few of these noble mansions still remain in Amsterdam in all their pristine integrity, giving a stately look to its old quays as their time-honoured fronts surmount the trees which line the borders of the canals. Their architectural characteristics might be considered as "debased" in the judgment of a severe student of the Art of building; but they have an imposing effect with their rich arcades, floriated pilasters, and fanciful gabled fronts, surmounted by statues, or vases of flowers.

After the removal of Potter to Amsterdam, he enlarged the proportions of his pictures, forgetful of the important fact, that size does not constitute greatness—for the ancient artists of Greece developed their genius as grandly upon an intaglio or a coin, as they did upon the Elgin marbles. He was, in fact, betrayed into this by emulation rather than design, for he saw there, in the possession of wealthy amateurs, pictures of far larger proportions than he had been in

* It is entitled "Blyde Inkomst der Allerdoorluchtigste Koninginne Maria de' Mediceis t'Amsterdam," and was published in that city in 1639; her majesty having paid the visit on her way to England, to visit her daughter, Henrietta-Maria, wife of our Charles I.

* Murray's "Handbook for Holland."

MODERN PAINTERS.*

THE conclusion of a given term of years leaves few of us morally the same as we were at its commencement. It is we think about ten years since the first volume of "Modern Painters" awakened the Art-circles to a consciousness of their utter ignorance of Turner. It might have been hoped that the mellowing influence of such a period had dealt with the impulsive emotions of Mr. Ruskin as it operates upon the crude sensibilities of others. But in the way of improvement, ten years have been a blank to him—he has learnt nothing. The book before us, it is true, is characterised by a selfish prudence in the abstinence of its author from that reckless dealing with names and reputations which blots the pages of former volumes—but Mr. Ruskin is not chastened; this is sufficiently evidenced by his notice of the Exhibition of the Royal Academy of last year, and yet more distinctly shown by a letter addressed by him to an artist of eminence in reference to Roberts' picture—"Rome." In the pages under notice the author has abstained almost entirely from abusive reference to British artists; but this negative atonement for the past will avail but little—it will not avert the finger of scorn, or silence the laugh of contempt; he learns too late that it is as easy to sneer in dispraise as it is to vociferate in clamorous and senseless laudation: the former injures himself—he feels it, and has omitted it in this book; the latter only injures his victim—this he will never feel. All that he has written in favour of Turner will not add one shilling to the real value of the works of that artist—were it so, surely even Mr. Ruskin would be ashamed of the cause he has taken up. Nor will anything that he has set forth against those men whose works he has so ignorantly and coarsely attacked, ever depreciate their productions to the consideration of one sixpence. Had Mr. Ruskin known really anything of the principles of Art, he might in his criticisms have been in some degree dangerous—as it is he is only ridiculous. Is this to be his last volume on the subject of "Modern Painters" ("Tandem aliquando Quirites—?"); the worst of it is, that having taken him by the hand from the first, we feel bound to read and report upon all he writes; in which, while seeking reputation, he has attained only to notoriety. Years ago we sought for something about Art in his first volume, but finding nothing we dismissed it in a few lines; his third, we cannot part with on such terms, because he has now been so long before the world in particular, and is now attempting the famous stage trick known in pantomimic circles as "swallowing himself." In any three volumes upon a given subject it is impossible to find less matter relative to the subject proposed. It is doubtful whether the series could ever be made of any utility, but it might be at least less offensive if, with the assistance of some competent person, he were to cut the whole down to a volume of three hundred or three hundred and fifty pages. Mr. Ruskin's criticism consists of two extremities—violent and unreasonable censure—extravagant and groundless eulogy. Such is the character of the book before us, we find its author continually in the suburbs, but never within the province, of Art; the book professes something about everything but painting. We have poetry, music, botany, geology, anything; but as soon as he feels himself warming into Art, he adverts to the leaf of the flower in his button-hole, or we may go and gather limpets on the sea-shore. The work is an overdone and excessively ill-designed frame with a blank canvas. In his chapter on "High Art," we thought at least he would have turned to Michael Angelo, and have turned his "Fall of the Damned" inside out; he might in hardihood have attempted it. But to turn at once to this book and its contents there is some significance in the quotation on the title-page, from Wordsworth:

"..... accuse me not
Of arrogance....."

* MODERN PAINTERS. Volume III. Containing Part IV. OF MANY THINGS. By JOHN RUSKIN, M.A., &c. &c. London: SMITH, ELDER, & CO., 65, Cornhill.

If having walked with Nature,
And offered, far as frailty would allow,
My heart a daily sacrifice to truth,
I now affirm of Nature and of truth," &c.

This is a confession that the author feels in some degree the truth of the strictures he has drawn down on himself; but it cannot be expected that it will be accepted as an apology by those whom he has so deeply outraged. The writer states in his preface that the delay in the appearance of this volume was occasioned by the death of Turner. "The first and second volumes were written to check, as far as I could, the attacks upon Turner, which prevented the public from honouring his genius at the time when his power was greatest. The check was partially given (?), but too late: Turner was seized by painful illness not long after the second volume appeared: his works towards the close of the year 1845 showed a conclusive failure of power; and I saw that nothing remained for me but to write his epitaph. The critics had done their proper and appointed work;—they had embittered, more than those who did not know Turner intimately could have believed possible, the closing years of his life; and had blinded the world in general (as it appears ordained by Fate that the world always shall be blinded) to the presence of a great spirit among them, till the hour of its departure. With them, and their successful work, I had nothing more to do; the account of gain and loss, of gifts and gratitude, between Turner and his countrymen, was for ever closed." This is an entirely new feature in Turner's biography—he died a martyr to the insensibility of the public and the strictures of critics, to which he was exposed during a lengthened and prosperous period of perhaps sixty-five years! Who will believe this maudlin absurdity? Turner died full of honour, and with a fortune very much larger, perhaps, than has ever been amassed by any member of the profession. Turner as a painter was idolised by the profession, and the public rushed in crowds to see his works, and purchased them at what prices soever he chose to appreciate them.

The expiring flicker of that vivid power which had made his reputation, was seen in two Venetian subjects, exhibited in the Royal Academy about fifteen or sixteen years ago. After these, all was uncertain; perhaps the "Téméraire" was his greatest work in the interval between that period and his death. The only hope for an artist late in life is to paint with even more care than he has been accustomed to employ in his youth. But Turner abandoned himself to a course of levity and eccentricity which his warmest friends could not defend. He himself did not understand his own extravagances. Mr. Ruskin professed to expound them, but he never could assist any one else to a knowledge of them. He does not aid the reputation of his friend in making him die of a broken heart, after a career of unexampled success. The first chapter, "Touching the Grand Style," is a fine field for one who has travelled and seen so much of Art as the author of this book; but it turns rather upon a paper by Reynolds contributed to the "Rambler," without venturing independently to touch at all upon any of the many examples of the "Grand Style" which we possess in this country—a subject which alone might have filled a volume. In treating of "Greatness of Style," it is said:—"For nearly every word that Reynolds wrote was contrary to his own practice: he seems to have been born to teach all error by his precept, and all excellence by his example: he enforced with his lips generalisation and idealism, while with his pencil he was tracing the patterns of the dresses of the belles of the day: he exhorted his pupils to attend only to the invariable, while he himself was occupied in distinguishing every variation of womanly temper: and he denied the existence of the beautiful, at the same instant that he arrested it as it passed, and perpetuated it for ever."

It does not surprise us, who know precisely Mr. Ruskin's qualifications, that he should write thus; but it will much surprise every artist who may read this, and a multitude of similar passages, that he should propose himself as an authority

in matters of painting, without being acquainted with the principles of the art. Mr. Ruskin does not seem to understand that, although Reynolds was a portrait-painter, he was also President of the Academy, and in that character delivered lectures upon, not portrait but historical painting. It had been well if some friend of the author of "Modern Painters" had looked over his manuscript before he gave it forth with such glaring errors to the world. He does not know that the same principles which assist the adjustment of the most complicated works, are also applicable to a single figure. Yet in his considerations on "Greatness of Style," notwithstanding his patent deficiencies, he presumes to set forth the elements of "greatness," saying that "the habitual choice of sacred subjects—such as the Nativity, Transfiguration, Crucifixion—(if the choice be sincere) implies that the painter has a natural disposition to dwell on the highest thoughts of which humanity is capable; it constitutes him so far forth a painter of the highest order," &c. In this strain we are told that Leonardo is a painter of the highest order; Raffaele, in reference to his School of Athens, is an artist of the second order. Again: in ordinary life, Hunt holds the highest rank, and Leslie is classed in the second, and Webster and Teniers are classed together. The book extends to 339 pages; and, little as there is, either new or in anywise available about Art, the author sometimes stumbles upon a wholesome truth. If the histories of the Bible are not still *all* waiting to be painted, not a very large proportion of those that have been attempted have received that justice which will satisfy a severe critic. The monstrous anachronisms in mediæval, and even in modern Art, are most offensive to every enquiring intelligence. We are told that Moses has never been painted; Elijah never; David never; Deborah never; Gideon never; Isaiah never. We perhaps go farther than Mr. Ruskin in this: if these, however, are the few sacred characters who have not been painted, there remains, perhaps, a considerably extensive list that have. What had Turner ever to do with Religious Art? We know not: yet we are told (p. 60) that Turner's Art and the Pre-Raphaelite movement, are to form the foundation of a new and a true method of religious painting. Turner—who ever revelled in the festive sunshine—devoted to the pleasures, luxuries, and utilities of this life—pronounced a painter of sacred history! Mr. Ruskin tells us that Religious painting is the highest class of Art, and places those artists who paint ordinary subjects in the second, third, and fourth ranks; and yet Turner, who painted only Venice and a thousand less interesting localities, is a painter of the first-class—a religious artist! It took something to make Turner smile, but he would have laughed outright at this, had such an observation been made to him in his life-time. He was much astonished at reading the qualities attributed by Ruskin to his works—he never knew what it meant: but it would have been still more unintelligible to him to be ranked among the religious painters.

We are glad to squeeze our author by the hand from time to time: we must agree with him upon a second point which seems entirely new to him. He takes three pages to tell us by precept and anecdote that in all Art the beautiful may be allowed to supersede rule or principle. In this long discussion he never hits upon the word genius. Great men, we are told, never know why they do this or that; they never speak of principles. The moment a man recognises a principle, Mr. Ruskin writes him down as a person of the lowest capacity. It is perfectly true that in all Art there are accidental flats and sharps, for which the author of a passage of painting or of music will account, not according to a principle, but because they tell well in the places into which they have fallen.

As an example of the complacent egotism of the book, we need only say that at the opening of the chapter on the Grotesque we find in the first seven lines the first personal pronoun "I" occurring no less than *six times*. Hence it will not seem surprising that Mr. Ruskin should continually fall back upon himself, referring to

"what I have said" in "The Stones of Venice," or in some antecedent volume. He adopts, accordingly, from "The Stones of Venice," the three kinds of grotesque there propounded. (A). Art arising from healthful but irrational play of the imagination in times of rest. (B). Art arising from irregular and accidental contemplation of terrible things; or evil in general. (C). Art arising from the confusion of the imagination by the presence of truths which it cannot wholly grasp." Although we continually find that the earliest acceptance of words is worn out, and other significations insensibly arise, yet the word "grotesque" is one which must ever remain the same, because it describes that definite character which distinguished the ancient ornamental compositions that were discovered during the brilliant period of Italian Art. The qualities of grotesqueness will always be associated with the ludicrous, and no effort upon the part of this writer will ever raise the meaning to heroic sense. From these dull prosaic periods we look up from time to time with a doubt that we can be reading the convictions of one who professes to have dwelt so long in the courts of Art—the whole series of essays looks so like one continued satirical experiment on public credulity. This essay on the "Grotesque" absorbs the whole cycle of the Muses—Ariel is a grotesque, as is also Titania! There is the "noble" grotesque, and the "sublime" grotesque; and the writer does not hesitate to address himself to Scripture for varieties of example, of which the following is quoted as one:—"Jeremiah, what seest thou? I see a scething pot, and the face thereof is toward the north. Out of the north an evil shall break forth upon all the inhabitants of the land." The word *ἀλλογροπία* is utterly ignored, but it nevertheless will retain its significance until some better term be found. If the grotesque be allowed to be thus comprehensive, wherefore are not the sublimest effusions of Milton—the most touching utterances of Shakspeare—the deepest emotions of the heart, and the most soaring imagery of the head, all grotesque? The chapter closes with seven pages about griffins—a disquisition on true and false griffins. Who in this wide world cares one feather about the best griffin that ever went before a tail? Faces, hands, feet, personal expression, are the most pointed illustrations of the grotesque; but Mr. Ruskin shrinks from addressing himself to these. From the chapter on "Finish" we make the following extract:—"And it will become us to consider seriously why (if, indeed, it be so) we dislike this kind of finish—dislike an accumulation of truth. For assuredly all authority is against us, and no truly great man can be named in the Arts—but it is that of one who finished to his utmost. [The italics are in the text.] Take Leonardo, Michael Angelo, and Raphael, for a triad to begin with. They all completed their detail with such subtlety of touch and gradation, that in a careful drawing by any of the three, you cannot see where the pencil ceased to touch the paper; the stroke of it is so tender, that when you look close to the drawing you can see nothing; you only see the effect of it a little way back! Thus tender in execution—and so complete in detail, that Leonardo must needs draw every several vein in the little agates and pebbles of the gravel under the feet of the 'St. Anne' in the Louvre. Take a quartette after the triad—Titian, Tintoret, Bellini, and Veronese. Examine the vine-leaves of the 'Bacchus and Ariadne' (Titian's) in the National Gallery; examine the borage blossoms, painted petal by petal, though lying loose upon the table, in Titian's 'Supper at Emmaus,' in the Louvre; or the snailshells on the ground in his 'Entombment'; examine the separately-designed patterns on every drapery of Veronese, in his 'Marriage in Cana'; go to Venice, and see how Tintoret paints the strips of black bark on the birch trunk that sustains the platform in his 'Adoration of the Magi'; how Bellini fills the rents of his ruined walls with the most exquisite clusters of the Erba della Madonna. You will find them all in a tale. Take a quintett after the quartett—Francia, Angelico, Durer, Heunling, Perugino—and still the witness is one, still the same striving in all to such utmost perfection as their

knowledge and hand could reach." All this is mere trifling; not one of these is more finished than it ought to be; and the finish thus extolled by this writer is nothing in comparison with the finish put into pictures in the present day. Millais professes to paint fifteen hundred grasses in an inch square. Fifteen hundred! we really know little of the varieties of these *gramina*, but we believe the microscope has revealed this number, in Millais' picture. According to our author we may even look for the lymph circulating in the ivy in Hunt's "Light of the World;" and after this is it not absurd to speak of the works of Raffaele and Leonardo. We may perhaps have examined more extensively than even Mr. Ruskin, the collection of drawings by Michael Angelo, and Raffaele, and Correggio and Leonardo, and of a long list of other celebrities—those relics which are most carefully kept in heavy chests in the little rooms near the Venetian Room in the Palazzo Vecchio at Florence. But the whole of these are only preparatory sketches—that quality which Mr. Ruskin lauds as finish is only a certain neatness in hatching a reticulated surface, but for which the whole would be ragged and broken. If no man be great who does not finish to the extent mentioned above, how can Turner be great who never finished at all, and whose execution of late years was so execrably bad—whose drawing generally was so faulty that in many cases where his figures were to be made out by the engraver, the latter was compelled to put them into form before he could send forth a plate to the world with his name to it. The "Old Téméraire" is an admirable picture, but when it was engraved the artist was obliged to correct the drawing of the towing steamboat, in order that it might look like a steamboat. We could quote innumerable instances of this kind, but in the face of all this Turner is quoted as an instance of high finish. The addition of such instances as those above is most absurd, because no picture in the present day would be admitted into any exhibition without a higher qualification than that described. And this is all that is said about finish: its value, its effects in opposition to shaded breadth where it is lost, are not thought of. Mr. Ruskin says nothing about the loss sustained by this quality in connection with hardness—nor of what it gains in connection with softness. He might have quoted Reynolds here once more with advantage—Sir Joshua's opinion of the nice balance of the sharp and the lost lines in Teniers, the only painter who understood this valuable nicety. Is there no finish in the Dutch school worth notice? and is mere imitative surface the sole end and object of finish? These and many others which we could propose, are questions that our author has not considered. In the chapter "Of the Use of Pictures," Mr. Ruskin notices some observations of our own, on the impossibility of his reconciling his taste for Turner with his "Pre-Raphaelite" enthusiasm. Silent contempt of empiricism on the part of those who could really determine between "a true" and "a false griffin," he arrogates to himself as so much admiration. "*People of any sense, however, confined themselves to wonder.*" "I think it was only in the *Art-Journal* of Sept 1, 1854, that any writer had the meanness to charge me with insincerity." "The pictures of Turner and the works of the Pre-Raphaelites are the very antipodes of each other; it is, therefore, impossible, that one and the same individual can, with any *show of sincerity*, [Note, by the way, the Art Union has no idea that *real sincerity* is a thing existent or possible at all. All that it expects or hopes of human nature is, that it should have a *show of sincerity*,] stand forth as the thick and thin [I perceive the writer intends to teach me English as well as honesty] eulogist of both. With a certain knowledge of Art, such as may be possessed by the author of 'English Painters,' [Note, further, that the eminent critic does not so much as know the title of the book he is criticising] it is not difficult to praise any bad or mediocre that may be qualified with extravagance or mysticism. This author owes the public a heavy debt of explanation, which a lifetime spent in ingenious reconciliations would not suffice to discharge. A fervent admiration of certain pictures by Turner, and at the same

time, of some of the severest productions of the Pre-Raphaelites, presents an insuperable problem to persons whose taste in Art is regulated by definite principles." We extract the foregoing passage to show the kind of defence Mr. Ruskin sets up. What we have said with respect to sincerity we still say,—the sincerity of every man who lavishes the most exaggerated expressions of admiration on two things diametrically opposite, will always be suspected. With respect to teaching Mr. Ruskin English, we should have said nothing about his eccentricities in the vulgate, had he himself not alluded to this; but since it is so we do not even decline the task, and commence by counselling him to avoid the monstrous affectation of coining useless words, when there are better at hand to express the meaning he would convey.

And with respect to the title of his work it is very likely, not having the work at hand, that we might misquote the title, but there could be no doubt about the book to which we alluded. Mr. Ruskin is equally wrong in speaking of the "Art-Union," which is not the title of this Journal ["This eminent critic does not so much as know the title of the book he is criticising,"]—but these are trifles about which we should not think a second time. To the subject of "classical landscape," on which really there is nothing to be said, because there was no "classical landscape," a rather lengthy chapter is devoted, the result of which is that because Homer always associated some utilitarian view with his rural descriptions—the Greeks had no taste for the picturesque. We cannot believe that a people so deeply imbued with an admiration of nature in one form could be wanting in feeling for it in another. The friends of this writer have again and again deprecated his at all retouching the very painful subject of Turner—but he insists in this volume on saying something in justification of his having proclaimed an equal admiration of Turner and his own Pre-Raphaelite friends, on the assumption that the same principles of feeling and execution are common to both. Having taken Mr. Ruskin by the hand in the best sense of the phrase, we feel most anxious that he should set himself right with the world of Art. But to this end the beginning must be made by himself, he must commence his amendment by acknowledging himself a little wrong. Having thus far succeeded we shall not despair of inducing him to acknowledge that he has been *very much* wrong. But this is hopeless so long as we find him quoting from himself, underpropping his baseless fabric of bygone years. Why will he thus continue to bestow his "tediousness" on those of his patient friends and well-wishers who really are desirous of hearing, even after the eleventh hour, if he have anything reasonable to offer in self-defence. We wish he would quote somebody else whose works are read, it is irksome to be continually referred to these books to learn "what I have said" on this or that really unimportant matter. So original is this writer that nothing in the entire range of Art-literature is found in support of his own surpassing views. He quotes Reynolds to prove him wrong, and poor Fuseli disappears overwhelmed with contempt. It is quite unnecessary to say a word in defence of Reynolds, but we will say of Fuseli, notwithstanding all his pedantry and affectation, that on any page he ever wrote, we will point out truths, practical truths, which Mr. Ruskin has never been able to understand. There are few of us who turning for a little time our backs upon the future and looking down the array of years through which we may have passed, would not wish to recall something we may have said, done, or written. When Mr. Ruskin is of this way of thinking we shall slay the fatted calf—none more than ourselves would rejoice in his regeneration—we await his *veni—vidi—pœcavi*. No one winces under correction more than he, but he endures the chastening with clenched teeth. He pronounces against the works of living painters in a manner the next thing to personal invective. Wherefore is he the Pariah of all Art Societies? Neither he nor no one need ask this. There is scarcely a brilliant reputation of our school that he has not done his best to sully—scarcely a meritorious name whose bearer he has not wantonly

humiliated by an offensive and revolting show of patronage. We will not detail the long list of distinguished painters of whom he has degradingly and scurrilously written—it would be painful to such persons to see their names brought forward in reference to this: indeed, we feel it were almost an impertinence to defend them. If he be a wanderer in the outskirts of Art-society with a mark on his forehead, it is but a hearty expression of repentance from himself that can in any wise serve him. The manner in which he essays to confirm and reconcile his views of Turner and the Pre-Raphaelites is not ingenious. His position is not so good as to be called even unsafe; we cannot even say of him that he has “not a leg to stand upon;” he is not even down, we do not find him in the condition of a man that might be picked up, but we find him falling with his pedestal, which he himself has cut from beneath him. “There are,” he says, “some truths easily obtained, which give a descriptive resemblance to nature; others only to be obtained with difficulty, which give inner and deep resemblance. These two classes of truths cannot be obtained together; choice must be made between them. The bad painter gives the cheap deceptive resemblance. The good painter gives the precious non-deceptive resemblance. Constable perceives in a landscape that the grass is wet, the meadow flat, and the boughs shady; that is to say about as much as, I suppose, might in general be apprehended, between them, by an intelligent fawn and a skylark. Turner perceives at a glance the whole sum of visible truth open to human intelligence. So Berghem perceives nothing in a figure, beyond the flashes of light on the folds of its dress; but Michael Angelo perceives every flash of thought that is passing through its spirit; and Constable and Berghem may imitate windows, but Turner and Michael Angelo are nevertheless the best.” Again: “Thus far, then, though the subject is one requiring somewhat lengthy explanation, it involves no real difficulty. There is not the slightest inconsistency in the mode in which throughout this work I have desired the relative merits of painters to be judged. I have always said he who is closest to nature is best. All rules are useless, all genius is useless, all labour is useless, if you do not give facts; the more facts you give the greater you are; and there is no fact so unimportant as to be prudently despised, if it be possible to represent it. Nor, but that I have long known the truth of Herbert’s lines,

“some men are
Full of themselves, and answer their own notion,”

would it have been without intense surprise that I heard querulous readers asking, “How it was possible” that I could praise Pre-Raphaelitism and Turner also? For from the beginning of this book to this page of it, I have never praised Turner highly for any other cause than that he gave facts more delicately, more Pre-Raphaelitically, than other men. Careless readers, who dashed at the descriptions and mixed the arguments, took up their own conceptions of the cause of my liking Turner, and said to themselves—“Turner cannot draw, Turner is generalising, vague, visionary; and the Pre-Raphaelites are hard and distinct. How can any one like both?” But I never said that he was vague or visionary. What I said was, that nobody had ever drawn so well; that nobody was so certain, so unvisionary; that nobody had ever given so many hard and downright facts.” Now the preceding effort at justification involves the usual fallacies, absurdities, and contradictions which characterize all Mr. Ruskin’s writings. We are neither at a fair nor at a horse-race, and yet this writer proposes to us a game—the name of which shall not sully our pages—wherein the only novelty in his method of play is, that he employs only two thimbles instead of three—these he calls “the cheap deceptive resemblance,” and “the precious non-deceptive resemblance.” But Mr. Ruskin is a novice at this game, for we very often find Turner under the wrong thimble. It will at once be understood what is meant by these terms—a picture affording “the cheap deceptive resemblance” is a passage of Art representing nature as we usually see it, a work

proposing the “precious non-deceptive resemblance” is a picture open to any interpretation which a playful imagination may put upon it. Nothing is easier than rhapsodical criticism. Constable is bitterly ridiculed because he succeeded in representing wet grass, the meadows flat as they were, and the boughs shady. Turner is extravagantly praised for succeeding (according to Mr. Ruskin) in representing a piece of the trunk of a tree so minutely as to require a microscope to discern its elaboration—an infinitely less difficult thing to do than that in which Constable succeeded. Again and again must we ask, how any one can express a taste for work of this kind, and in the same breath praise, as meriting equal encomiums, such a work as Turner’s “Napoleon?” and yet Mr. Ruskin does this. Constable painted what he saw, as also do the Pre-Raphaelites, yet Constable is coarsely censured.*

PICTURE SALES.

THE picture sales of the season commenced on the 27th of February; Messrs. Foster & Son having on that and the following day offered a portion of the collection of Mr. Birch of Birmingham to public competition; it consisted of forty-six drawings and twelve oil-paintings. Mr. Birch’s pictures were well known to amateurs, and the prices they realised are not only evidence of their excellence, but show likewise that the state of the money-market as regards Art is in a healthy and flourishing condition. The dealers mustered numerous in the rooms of the auctioneers and bid so freely there was no chance of any mere amateur securing a bargain: the principal lots fell to the bidding of these gentlemen; whether they bought on their own account, or on commission for others we know not; but, any how, we have an idea that some “paid dearly for their whistles,” however meritorious the works of the artists are in reality. One thing is evident from this sale; our painters need not at present begin to despond, nor fear to be driven out of the field by the progress of photography, or any other of the many *graphies* which our age has produced; the painter’s star is yet in the ascendant.

The first day’s sale included the drawings; of these there were thirteen little gems by our old favourite DAVID COX, most of them of his best time; they all sold well, one, ‘Figures, with Cattle at a Watering-place,’ from the Bernal Collection, realised 23*l.* 12*s.* 6*d.*; and another, ‘The Hop Gatherers,’ 28*l.* 7*s.*; two by S. AUSTIN, an artist who has been dead several years, and whose works we used much to admire in the gallery of the Old Water-Colour Society, sold for 9*l.* 19*s.* 6*d.*, and eight guineas respectively; ‘Macbeth and the Murderers,’ and another by G. CATTERMOLE, sold for 37*l.* 16*s.* and 28*l.* 7*s.* respectively; ‘Venice,’ by the same artist, and the ‘Dance,’ also by him, 50 guineas and 43 guineas; ‘Ullswater,’ by DEWINT, 20 guineas; ‘Richmond Bridge,’ DEWINT, 29 guineas; the ‘Spring Garland,’ WALTER GOODALL, 33 guineas; the ‘Lacemaker,’ by the same, 17 guineas. The drawings of W. HUNT sustained the popularity of this inimitable artist, as the following prices indicate, ‘Plums,’ 24 guineas; ‘Hyacinth, and other Flowers, on a bed of Moss,’ 29 guineas; ‘Pine-apple and Grapes,’ 31 guineas; ‘Grapes and a Pear,’ 26½ guineas; the ‘Fortune-teller,’ 53 guineas; the ‘Cricketer,’ from the Bernal Collection, 81 guineas; the ‘Cold Morning,’ also from the Bernal Collection, 49 guineas. ‘French Peasants,’ a small drawing by J. J. JENKINS, was knocked down for 10½ guineas; and a larger, and very charming work by the same artist, ‘Scene on the Danube,’ 48 guineas; ‘Cow and Sheep,’ a very small work, by T. S. COOPER, A.R.A., 18½ guineas; ‘A Spanish Lady,’ J. LEWIS, 12½ guineas; ‘Pandy,’ by the late W. MULLER, 11 guineas; ‘La Fille mal gardée,’ a small highly-finished drawing, by MACLISE, dated 1853, sold for 41 guineas; a beautiful specimen of the

water-colour painting of F. P. POOLE, A.R.A., ‘Village-Girls and Child at a Spring,’ was purchased by Mr. Wallis for 60 guineas; ‘A Naval Engagement,’ by C. STANFIELD, R.A., 9 in. by 6 in., 21 guineas; ‘Highland Drovers ascending the Mountain,’ by F. TAYLER and BARRETT, 27½ guineas; ‘On the Nile,’ by J. M. W. TURNER, 11 in. by 9 in., 60 guineas, bought by Mr. Holmes; and ‘Calais Lighthouse,’ also by TURNER, and of the same size as the other, was bought by Lord St. Leonards for 55 guineas. The twelve oil-paintings from Mr. Birch’s collection reached the following prices—‘River Scene,’ BONINGTON, 40 guineas; ‘Whitchurch, Haymaking,’ W. MULLER, 140 guineas, bought by Mr. Holmes; ‘Welch Mountain Road,’ J. LINNELL, 241*l.* 10*s.*, knocked down to Mr. Wallis; ‘A Nursery Scene,’ by PLASSAN, a modern French painter, 88*l.* 4*s.*; ‘The Advent of Spring,’ F. DANBY, A.R.A., bought by Mr. Holmes for 273*l.*; ‘Gillingham, Kent,’ by LINNELL, by Messrs. Colnaghi, for 546*l.*; ‘Canterbury on the Stour,’ T. S. COOPER, A.R.A., by Messrs. Graves, for 194*l.* 5*s.*; the ‘Golden Age,’ ETTY, bought in at 850*l.* 10*s.*; ‘Sir Thomas More and his Daughter,’ J. R. HERBERT, R.A., a repetition of the same subject in the Vernon Gallery, and engraved in the *Art-Journal*, bought by Messrs. Lloyd, Brothers, for 160 guineas; ‘the Windmill,’ J. LINNELL, by Mr. Wallis for 546*l.*; ‘The Approach to Venice,’ TURNER, by Mr. Wallis for 882*l.*; ‘The Baron’s Hall,’ by MACLISE, bought in at 1050*l.*

Immediately after the conclusion of the sale of Mr. Birch’s pictures, Messrs. Foster proceeded to dispose of about thirty-three paintings, the owner of which was not announced. The principal among them were ‘The Smuggler’s Cottage,’ T. WEBSTER, R.A., 210*l.*; ‘The Entrance to the Zuyder Zee,’ C. STANFIELD, R.A., bought by Mr. Agnew for 493*l.* 15*s.*; ‘The Barge,’ J. CONSTABLE, by Mr. Holmes for 367*l.* 10*s.*; ‘The Contest for the Golden Girdle of Florimel,’ F. R. PICKERSGILL, A.R.A., 100 guineas; ‘Furs and Furze,’ J. T. LINNELL, 110 guineas; ‘Scene from the Bourgeois Gentilhomme,’ W. P. FITCH, R.A., 493*l.* 10*s.*, knocked down to Mr. Agnew; ‘The Basiful Lover and Maiden Coy,’ F. STONE, A.R.A., 131*l.* 5*s.*; ‘The Homestead,’ the engraved picture, J. F. HERRING, 231*l.*; ‘Scene in Wales,’ J. B. PYNE, 70 guineas; ‘Lake Como,’ C. STANFIELD, R.A., bought by Mr. Pemberton Leigh for 252*l.*; ‘Timber in a Landscape,’ F. R. LEE, R.A., 70 guineas; ‘Venus and Cupid,’ 8 in. by 6 in. only, W. E. FROST, A.R.A., 42 guineas; ‘Cow and Sheep,’ T. S. COOPER, A.R.A., 100 guineas; ‘Ruins near Athens,’ 20 in. by 16 in., D. ROBERTS, R.A., 64 guineas; ‘A Gitana,’ 17 in. by 14 in., J. PHILLIP, 75 guineas; ‘The East,’ F. STONE, A.R.A., 32 guineas; ‘Scene in Sherwood Forest,’ T. CRESWICK, R.A., and R. ANSDALL, 123*l.* 18*s.*; ‘Master Heriot and Margaret Ramsay,’ 16 in. by 12 in., A. L. EGG, 62 guineas; ‘The Smithy,’ 14 in. by 12 in., F. GOODALL, A.R.A., 45 guineas; ‘The Rose of Seville,’ C. BAXTER, 130 guineas, bought by Mr. Rought; ‘Dark Eyes,’ J. SANT, 102 guineas, bought by Mr. Wheen; ‘The Rival’s Marriage,’ W. ANTHONY, 100 guineas; ‘Robinson Crusoe reading his Bible,’ 19 in. by 15 in., C. R. LESLIE, R.A., 126 guineas; ‘Arming the Knight,’ J. CATTERMOLE, 27 guineas; ‘Andromeda,’ 20 in. by 13 in., W. E. FROST, A.R.A., 98 guineas; ‘Christ Walking on the Water,’ R. S. LAUDER, R.S.A., 50 guineas; ‘On the Scheldt,’ E. W. COOKE, A.R.A., 125 guineas; ‘Cologne,’ C. STANFIELD, 420*l.*, bought by Messrs. Graves; ‘The Flight into Egypt,’ attributed to J. DANBY, A.R.A., 40 guineas; ‘View near Sydenham,’ P. NASMYTH, 155 guineas, bought by Mr. Ravenshill; ‘The Vicar of Wakefield,’ 162*l.* 15*s.*, bought by Mr. Agnew; ‘Cordova,’ E. A. GOODALL, 26 guineas.

On the 7th of March, Messrs. Christie & Manson offered for sale a portion of the pictures and articles of *virtu* collected by Mr. W. Wethered, of Regent’s Park. Of the paintings, this collection was richest in the works of ETTY, but if our recollection serves us aright, several of the best examples of this master were not included in the sale, and of those which were disposed of, many were only studies and sketches. We subjoin a list of those which realised the highest prices:—‘Eurydice,’ 64*l.* 1*s.*; ‘Three

* To be continued.

Nymphs in a Landscape,' a fine specimen of the painter, 169*l.* 1*s.*; 'A Pheasant and a Group of Fruit and Flowers,' small and very rich in colour, 78*l.* 15*s.*; 'An Israelite indeed,' 57*l.* 15*s.*; 'The Forest Family,' 201*l.* 12*s.*; 'Norman Peasants at a Fountain,' 96*l.* 12*s.*; 'The Three Sisters,' 63*l.*; 'A Bacchante lying on a Panther's Skin,' 109*l.* 4*s.*; 'The Syrens, from "Comus," with Cupids in the lunettes,' a fresco, 117*l.* 12*s.*; 'The Young Scribe,' 136*l.* 10*s.*; 'A Nymph reclining,' 154*l.* 7*s.*; 'The Green Wood Shade,' painted expressly for Mr. Wethered, a work of the highest quality as an example of Etty, 201*l.* 12*s.*; 'The Daughters of Hesperus dancing round the Golden Tree, from "Comus,"' a fresco designed for Buckingham Palace, the merits of which we certainly failed to discover, 105*l.*; another fresco of the same subject, 94*l.* 10*s.*; 'Zephyr and Aurora,' truly designated in the catalogue as "one of the artist's most beautiful poetical compositions," 745*l.* 10*s.* The large picture of 'Joan of Arc finding the Sword' was bought in.

The other pictures belonging to Mr. Wethered sold at the same time were, generally, small in dimensions, but they sold well:—'Three Cows in a Landscape,' T. S. COOPER, A.R.A., 89*l.* 5*s.*; 'An Italian Coast Scene,' C. STANFIELD, R.A., 136*l.* 10*s.*; 'Interior, with Cattle,' T. S. COOPER, A.R.A., 126*l.*; 'Leith Hill, Surrey,' very small, J. LINNELL, 127*l.* 1*s.*; 'A Roman Mother and Child,' C. R. LESLIE, R.A., 68*l.* 5*s.*; 'A Fresh Breeze,' C. R. STANFIELD, R.A., 143*l.* 17*s.*; 'A Boar Hunt,' J. LINNELL, 91*l.* 7*s.*; 'Brigands in the Apennines,' C. STANFIELD, R.A., 68*l.* 5*s.*; 'Turkish Merchants fording the River Mangerelii, in Asia Minor, by Torchlight,' W. MULLER, 99*l.* 15*s.*; a pair of small landscapes, by F. R. LEE, R.A., with cattle by T. S. COOPER, A.R.A., 105*l.*; 'The Siege of San Sebastian,' C. STANFIELD, R.A., the sketch for the larger picture, we think, 106*l.*; 'Interior of St. Stephen's, Vienna,' a small duplicate of the large painting exhibited two or three years since, 284*l.* 11*s.*

The priced catalogues of two sales of pictures that have recently taken place in Edinburgh have been forwarded to us by a correspondent there. The one purports to be that of "the cabinets of the late Earl of Caithness, and of a gentleman of taste, recently deceased, together with the select collection of a gentleman removed in the country." The other collection was announced as "the property of Signor Galli, who, in consequence of declining health, has resolved upon retiring from business, comprising choice examples selected from Continental and British galleries during a period of forty years." We annex the prices which a few of the pictures of Signor Galli realised, as examples of the two collections:—'The Death of Lneretia,' GUIDO, 11 guineas; 'Christ carrying the Cross,' OLD FRANKS, 10*s.*; 'A powerfully painted Head,' CORREGGIO, 14*s.*; 'Head of a Saint,' SEBASTIAN DEL PIOMBO, 10*s.*; 'View in Venice, with Gondolas and Figures,' J. M. W. TURNER, one of the best finished pictures of this great landscape painter, 4*l.* 10*s.*; 'A Music Party of Six Cavaliers and Ladies, under the porch of a palace in Italy,' a gallery picture of great importance, by PAUL VERONESE, 6½ guineas; 'A Grand Gallery Picture, representing Diana and her Nymphs Bathing,' splendid in colour, and in the finest state of preservation, from the collection of Lord de Tabley, by PAUL BRILL and A. CARRACCI, 14 guineas; 'The Magdalen,' GUIDO, 3*l.* 5*s.*; 'The Angel appearing to Mary,' GIULIO ROMANO, a fine cabinet example of this master, 4*l.* 15*s.*; 'Christ bearing the Cross,' MURILLO, 2*l.* 2*s.*; 'Christ brought before Pilate,' RUBENS, 2*l.* 7*s.*; 'Italian Landscape, with Figures,' POUSSIN, 4 guineas; 'Portrait of Albert Cuypp,' REMBRANDT, 45 guineas. We have no doubt the purchasers of the whole of the pictures are satisfied with their bargains, and as little that they have ample reason for being so; the paintings seem to have realised their full value, including the frames, and nothing more, and we dare say will make very good "furniture pictures." This is as it should be, and we have no further comment to make on the sales. But would such results have happened ten years ago, before the *Art-Journal* had taken these matters under its notice? We guess not.

HAGAR AND ISHMAEL.

ENGRAVED BY J. H. BAKER, FROM THE BAS-RELIEF BY E. S. BARTHOLOMEW.

IN a very recent number of the *Art-Journal* we remarked, as, indeed, we have done on several previous occasions when writing of Sculpture, how wide a field lies open in the pages of Scripture for the operation of the sculptor's art, and how little absolute necessity there is for an everlasting occurrence to heathen fable or heathen history for subjects. Nay, we will venture to hazard an opinion, that were the works of the sculptor more in accordance with the tastes and habits of the age—prejudices, some would, perhaps, call them, whether rightly or wrongly we do not now care to enquire—he would have less occasion to complain of want of patronage than he has good reason for doing. People will not purchase what is repugnant to their feelings, or opposed to their tastes, however excellent it may be as a work of Art.

The Bible absolutely teems with passages—we could point out a hundred—eminently suggestive of subjects for sculpture: many have already been adopted, others are waiting the selection of the artist, and he will not, we are sure, search long without finding what he wants, whether it be of the poetical, the dramatic, the heroic, or of any other kind. We have no recollection of seeing any previous representation in sculpture of the subject of which Mr. Bartholomew has made so very pleasing a group. Mr. Bartholomew is an American, a native of Colchester, in the state of Connecticut, and although in that comparative remote locality he was far removed from everything pertaining to the fine arts, he very early exhibited a decided taste for sculpture. His parents removed to Hartford, the capital of Connecticut, when he was fifteen years of age, when he at once commenced the study of the art, in the face of the many difficulties existing in a new country where but little art exists, and amid the opposition of his parents and the discouragement of friends. He persevered, nevertheless, till he had reached his twenty-eighth year, when he determined to realise his long bright dream of Italy, and, accordingly set sail for that country, and arrived in Rome in January 1851. After passing a year there, studying the antique, and especially bas-relief sculpture, he undertook a trip to Athens, for the express purpose of seeing the friezes of the Parthenon, returning, after an absence of four months, with many proofs of his knowledge and appreciation of the beauties of the Greek sculptures.

In one of the papers entitled "A Walk through the Studios of Rome," published in the *Art-Journal* last year, reference was made to a statue by this sculptor, who still resides in Rome; the subject is "Eve repentant," the figure is considered by competent judges, we are given to understand, as the best female statue ever executed by an American, it has only just now been finished in marble. A correspondent writing to us from Rome, speaks thus of Mr. Bartholomew. "I know of no one who has encountered so many discouragements, or overcome more obstacles. His only care and desire seem to be to arrive at great excellence in his profession."

The two figures in this bas-relief are not circumstanced according to the description recorded by Moses, but the treatment of the narrative is sufficiently expressed. Hagar is "lifting up her voice" for her child, whom famine and thirst threaten to destroy in the wilderness of Beer sheba. The attitude of the mother is one of earnest supplication, that of Ishmael one of helpless dependence; the heads of both are remarkably expressive, and the figures group well in the composition, all the lines seeming to flow naturally yet picturesquely; we should, however, have preferred to see greater breadth given to the drapery below the loins on the right, by less redundancy of folds. The bas-relief is three feet eight inches in height, by two feet two inches in width: it still remains unsold in the atelier of the sculptor, though many of his inferior works have found purchasers.

CREATION OF A MUSEUM OF MANUFACTURED STUFFS AT LYONS.

THOSE of our readers, who feel an interest in that most important subject, the development and practical success of our Industrial Schools of Design, will, we doubt it not, be struck with the following communication, which we find contributed to the *Revue des Beaux Arts* by a member of the French Legislative Assembly.

"In this fair land of France, where artistic aspirations are all-pervading—where, as it was emphatically affirmed, a few years since, *they love Art for Art's sake*—every one has a theory respecting painting, drawing, sculpture, &c., while but few carry those theories into practical application. Many seem to fancy that artistic composition has no other aim or object than to represent eyes, noses, ears, and historic incidents. That is surely an obvious error. Design is, and ever should be, intimately connected with works of industry. It is indispensable in furniture, in drapery, in the whole range of upholstery.

"Nevertheless, let us now ask, where amongst us are the schools of Industrial Art? What is their number? Is the necessity for their existence truly appreciated?

"England, that *Alma Patens* of modern industry, has learned to feel, since the occurrence of her Great Universal Exhibition, the error which, in this regard, she, like us, had committed, and she has hastened to repair it, in organising three hundred schools of design—a great number of connected museums, three hundred professorships, and an inspector for each of her counties. The very detailed Report recently prepared by her official department of the Fine Arts, as to the result of this operation, has returned 55,000 as the number of young students, who, in the year 1853, availed themselves of the new schools. We know further, that this number has in 1854 been advanced to 62,000, and to 70,000 in 1855.* The movement so begun cannot but be accelerated. Where will it stop?

"The erection of these schools, and the foundation of these museums in England should awaken the attention of our industrial classes, and of our Government. The enlightened efforts of our rivals—the sacrifices to which they subject themselves, in order to perfect the tastes of their workmen and industrial artists are, we may feel assured, but the prelude to persevering efforts, which British pertinacity will carry out to its extreme conclusion, to diminish gradually our superiority, and bring the productions of the United Kingdom to a level with the excellence of those of France.

"Hence it is that, with all our heart, we applaud the good and great project, which has, for so long a period, been entertained by Monsieur the Senator Vaisse, the administrator of the Department of the Rhone, and which he has succeeded in realising through the vote of the Chamber of Commerce of Lyons, to create in this city a Museum for Woven Fabrics, where the students in Industrial Design may, by studied comparison of texture and pattern, recognise the beauties and the errors by which they may be illustrated or injured.

"At present how happens it with the young man who, leaving the school of St. Pierre at Lyons, or even the Industrial School directed by M. Chantre, enters into a great establishment or manufactory of stuff? The designs which he produces and offers may be linearly irreproachable as representing either foliage or vegetable form; but he knows not what result may be arrived at when his work has been subjected to the operation of the loom. He hesitates, he proceeds with uncertainty, and he fails.

"If, on the contrary, he has previously studied the various structure of woven fabrics, and can clearly account, in his own mind, for the effects of harmonic contrasts which they exhibit, he then not only produces a good design, but one which the weaving operations will easily realise, and which will redound to his honour.

* The writer, it will be observed, has greatly exaggerated.

HAGAR AND ISHMAEL.

ENGRAVED BY J. H. BAKER, FROM THE BAS-RELIEF BY L. S. BARTHOLOMEW.

"Here in Lyons he will now find those means of practical investigation of which he has hitherto felt the want. The Museum of Woven Fabrics will not only furnish him with examples of effects for his compositions, but will present him with a history of his Art. The great houses of Meynier, Mathevon, Bouvard, Ymeniz, Cuiet, Soidelquerck and Lewire, those leading agents of the industry of Lyons, will hasten to open, for the use of the new museum, their archives of manufacture with examples carried back even to the sixteenth century. The amateurs of antiquities will present to it ecclesiastical stuffs old as the middle ages—as the ninth century—some covers of immemorial manuscripts will yield up needlework of the old world. In a word, in a few years from the present time Lyons will have enriched herself, and at a very little expense, with a collection of the kind in question, which we doubt not will be unequalled in the world.

"What is requisite to effect this? But a little good-will and energy on the part of a philanthropic administrator.

"The question is now before the Municipal Court of Lyons, where Monsieur Vaisse has carried a vote approving of the principle of the Museum. The Chamber of Commerce has done as much. Monsieur Rouler, the minister of public works, is its warm partisan, and only waits for the practical movement to lend it all his aid. We trust that the Municipality of Lyons will thoroughly associate itself with the zeal and hopes now indulged on all sides, and that this chosen body of citizens will endow its native city with a new, and most useful element of study and progressive improvement.—ACHILLE JUBINAL, Member of the Legislative Council."

ANOTHER CONVERSAZIONE AT THE PAVILION AT BRIGHTON.

WE have had another pleasant soirée at the Pavilion. The number of guests was about eleven hundred, and it is but doing justice to the honorary secretaries of the Brighton Literary and Scientific Institution to say that the arrangements for the evening's entertainment appeared to give general satisfaction.

The whole suite of state-rooms, five in number, and also the old picture gallery, were thrown open upon the occasion, and the different objects of Art and entertainment were so equally divided and arranged in the different apartments, that, with the exception of the music room, and the picture gallery, which are always crowded, no inconvenience was experienced by the pressure of the large assemblage in any of the apartments.

Commencing our examination with the Banqueting Room, we observed a beautiful and numerous collection of birds of the most brilliant plumage, and many cases of foreign butterflies and moths, among the latter of which were some of enormous size. These were exhibited by Mr. Swaysland, whose skill in preserving natural history specimens is well known.

At the end of the room were several models of vessels and steamers. The railway company also contributed, among other articles, a series of models, on a small scale, of the carriages in actual use on the line. Less useful, but more curious, was a model of a locomotive engine seven inches in length, and complete in all its parts, made by Mr. D. Dixon, an engine-driver on the Brighton line, who had employed in constructing this diminutive model the leisure hours of four years and a half. It was pleasant to see the air of gratified pride which beamed on the countenance of the happy and skilful mechanic as he listened to the expressions of admiration elicited from the spectators while examining the diminutive object which had occupied his thoughts and his hands for so long a period. He seemed to look upon his engine with the same affection that a sailor entertains for his ship.

Turning from the machinists, the next object

which claimed our attention was a new invention of Mr. Wildman Whitehouse, the same gentleman to whom the sum of 5000*l.* was recently awarded for improvements in the electric telegraph. The new invention is an instrument called the Electric Harmoniograph. It is designed to afford facilities for composition to those who possess a musical ear and taste, but who, not having made music their profession, have neither the time, nor probably the aptitude required, for attempting written composition. It will also be found useful to professors for recording their fugitive thoughts for future reference. A galvanic battery is connected by wires with the keys of the instrument upon which the performer is playing; and, as each note is struck, the electric apparatus records it with proper emphasis on lines produced by the same agency, upon a strip of calico prepared to receive the impression. The notes are indicated by dark-blue lines instead of dots—the length of the lines marking the relative value of the notes. The naturals record themselves on the lines and in the centre of the spaces; the semi-tones occupy a position midway between them—the sharp above, the flat below its corresponding natural. The division into bars can be effected at the time, if necessary, by the mere beat of the foot; it is, however, thought better to calculate the bars afterwards by reference to the notes in accordance with their known value. An improvement is, we are told, contemplated, by which the division into bars will be produced by the same action as the notes. The system may be termed a stenographic or short-hand system of musical notation, the correctness of which, when fully understood, is unavoidable, and a copyist would be able to transcribe any composition with perfect ease, after ascertaining the key and the time intended to be used. The Harmoniograph was, we are informed, exhibited to her Majesty the Queen and Prince Albert by Mr. Whitehouse, the inventor, assisted by Mr. F. Wright, on the occasion of the royal visit to the Polytechnic Institution. At the conversation Mr. F. Wright again kindly gave his assistance, and afforded explanations to the numbers who crowded round the apparatus. We had the pleasure of receiving, as a specimen of the work, the air of "God Save the Queen."

A Russian swivel gun, capable of carrying two miles, and which was taken at Balaklava, occupied the centre of the room, and was an object of interest to many persons; while some of the younger guests found amusement in watching the activity of the shrimps, as they darted rapidly through the water and among the seaweeds of the aquarium, or the awkward movements of the hermit crab which was restlessly thrusting forth its claws from its new lodging in a whelk shell.

Near the door, a collection of phrenological casts attracted some attention, and some of the guests suffered their heads to be manipulated by the gentleman who presided over this department. At a later period of the evening, Mr. Collier exhibited the electric light, which astonished by its brilliancy, while it dazzled the eye by its fitful flashes.

The yellow drawing-room was devoted to the exhibition of works of Art. A few paintings lent by different gentlemen were placed on easels around the room. Groups of French paper flowers, made by Miss Crowhurst, of East-street, and collections of shells and sea-weeds, exhibited by Mr. Pike, occupied the end of the room.

One of the most interesting tables was that at which Mr. M. Penley presided. Here we noticed a pair of Cellini cups, a pair of Sèvres Tazze, and several shell cups lent by Mr. Bright; a silver cup of Indian workmanship, exquisitely chased, and of elaborate and elegant pattern, especially the stem and foot, which displayed that happy adaptation of the design to the form of the object for which Indian artists are so remarkable. The effect of the design on the body of the vase, extremely graceful in itself, would have been more striking had it been less elaborate. This beautiful cup was lent for exhibition by Mrs. Graham. In a glass case near the cup were some Indian ornaments in

filigree silver, and some exquisite embroidery in gold from Benares. A case of miniature portraits of the Sikh princes by native artists, were more interesting as studies of Sikh physiognomy than as works of Art, and the beauty of Dhuleep Singh was no less conspicuous than the coarse brutality visible in the countenances of some of the other chiefs. A Sikh knife, without ornament, and of remarkably neat workmanship, lay, with its sheath, by the side of the case containing the miniatures of the Sikh princes and warriors, while an Indian shield of stout leather, ornamented with enamelled bosses, was placed on a chair near the other Indian articles.

On the same table was a book containing very interesting illuminations from a MS. missal, attributed to Albert Dürer. The subjects are executed on vellum with body colours; the hair, and many other parts of the figures, are gilded. The subjects are treated with the quaint elaborateness of the period, but some of the figures, especially one of the Saviour, are full of grace and dignity. It would occupy too much space were we to mention all the objects of Art-manufacture and the curiosities which attracted our attention. We noticed a small equestrian statuette of Napoleon in silver, from the Great Exhibition; and in a glass case near it, an "assignat" of the French republic.

We must not omit to notice an ingenious model belonging to Mr. Penley, of Carisbrook Castle, or the smallest lever watch in the world, made by Mr. G. Funnell of this town.

The photographs were good, but not numerous; some views of Hampstead Heath, and trees under their wintry aspect, pleased us exceedingly. Two views of the sea from the shore would have been admirable studies of the waves, had not the motion of the water rendered them slightly indistinct.

One of the tables was occupied by botanical specimens; among these we remarked an interesting collection of flowering plants from the stoves of the Rev. Mr. Roper, and many varieties of graceful ferns, as well plants as fronds.

In the centre drawing-room, stereoscopes and microscopes divided the attention of the visitor, while, in the further drawing-room, were displayed the collection of minerals belonging to Mr. Turrell, and the fine and valuable fossils of the chalk, lent by Mr. Henry Catt. The collection of sponges was particularly interesting, and many of them very beautiful. Some vertebrae of a whale, and the molar teeth of a fossil elephant, both found in the neighbourhood of Brighton, excited astonishment from their enormous bulk.

During the evening, the company were entertained with music. A concert, in two parts, with an interval of an hour and a half between them, took place in the music room. Herr Kuhe played two solos, while between the parts Mr. Thomas Wright played a grand fantasia on the harp in the banqueting room, and Mr. Sleight afterwards explained and illustrated his mode of educating the deaf and dumb.

A great addition to the pleasures of the evening was the view of the beautiful water-colour drawings from pictures in the private galleries of her Majesty the Queen and Prince Albert. These were the copies made for the purpose of being engraved in the Royal Gallery of Art, and *Art-Journal*; many of the subjects are, therefore, familiar to the readers of this Journal. By the kindness of Mr. S. C. Hall, these pictures were lent for exhibition to the Brighton Society of Arts, and this society liberally threw open the exhibition to the guests assembled on this occasion at the Pavilion. We regret, however, to remark, that while musical talent commands almost any price in Brighton, the number of those who will pay a shilling for the pleasure of seeing pictures is extremely limited. It is saying but little for the taste of a wealthy town, containing nearly 70,000 inhabitants, to express a doubt as to the success of an annual exhibition of paintings; we will therefore hope that our fears are without foundation, and that one of the most luxurious towns of the empire will show at least as much encouragement to the imitative arts as the commercial towns of equal size and equal wealth.

M. M.

THE STEREOSCOPE.

THE Stereoscope is now seen in every street, it is found in almost every drawing-room ;

philosophers talk learnedly upon it, ladies are delighted with its magic representations, and children play with it. Notwithstanding this, we find a very general ignorance prevailing of the principles upon

there are not many men or women who have paused a moment to consider—Why, having two eyes, they do not always see all things double? The stereoscope, to a certain extent, answers the question ; it is, therefore, important—and it cannot be without interest—that we should endeavour to explain, as popularly as possible, this instrument, which enables us to see things as they are in nature.

We derive the term stereoscope from two Greek words—*στερεος*, *solid*, which we commonly employ in *stereotype*, signifying *solid type* ; and *σκοπεω*, *to see*, used also in *telescope* and *microscope*. The word therefore means, *solid to see*, the instrument converting images drawn upon a plane surface into apparent solids, or images possessing three dimensions—*length*, *breadth*, and *thickness*. If we first describe the construction of the stereoscope, the subsequent explanation of its principles and its phenomena will be rendered more intelligible. The accompanying figure represents one of these instruments, mounted in the manner now adopted by the *London Stereoscopic Company*.

The refracting or lenticular stereoscope—as this form of the instrument is called, to distinguish it from the reflecting stereoscope, which we have already described (*Art-Journal*, 1852)—consists of two eye-pieces at *e*, adjusted as in an opera-glass ; an oblong box, with a door on one side, to allow the light to fall in upon pictures on opaque tablets ; and a flap, *d*, which can be adjusted at any angle by the adjusting pulley, *c*, the object of this opening being to render visible pictures upon transparent surfaces. This stereoscope is mounted upon brass pillars, which can be fixed to any height convenient to the observer by the screw, *a*, while the instrument can be placed at any angle by means of the joint at *b*. By these simple methods the stereoscope is rendered perfectly convenient for all kinds of pictures, and under all circumstances for observation. The brass eye-pieces, *e*, in which the optical arrangements are placed, are capable of adjustment to meet the differences in the width between the two eyes which are found occasionally, and the varia-

which this instrument is constructed, and still greater want of knowledge of the philosophy which it involves.

We are so little in the habit of asking ourselves questions about *common things*—to employ a very hacknied phrase—that

THE GLEN OF MEIRINGEN, SWITZERLAND.

tions in focal distance to meet the conditions of sight.

Such is the external structure of the instrument. The pictures which we place in

it for observation may be geometric drawings made according to a fixed rule, photo-

graphic pictures upon daguerreotype plates, or positive copies on paper or glass from collodion negatives or collodion positives. Two pictures of the same object, or set of objects, are mounted side by side on the slide, as in the accompanying landscape, "The Glen of Meiringen, Switzerland," and this being placed at the base of the

stereoscope, and looked at through the eye-pieces, resolves itself into one image of perfect solidity—a miniature realisation of the picturesque scene itself.

The lenses of this instrument are but parts of lenses; this we must explain. The above figure, *a*, is a section of a double

convex lens, the inner lines being intended to indicate the fact that such a lens is virtually two prisms placed together at their bases. Such a lens is cut into halves or quarters, and these are placed in the instrument with their edges opposite each other, as *b b*.

The rays of light passing through the air

and then traversing a denser medium are bent from their straight path, or refracted, and the degree of refraction depends upon the density and thickness of the medium

the edges of two prisms, we observe two images, properly constructed, and continue onward the lines of sight, we shall find the two pictures will resolve themselves into one image.

To explain this, let us suppose a skeleton stereoscope—engraved on the former column. Two geometrical figures, *a*, *b*, the lines forming a square pyramid, are on the tablet, and these are viewed through the prismatic

lenses, *c*, *d*, the rays proceed from the objects along the straight lines *e f* and *e' f'*, but those rays entering the lenses are bent, and enter the eye along the lines *g h* and *g' h'*. Now, if those lines are continued to *i*, it will be seen that the two images will be superposed, and form one; so that, under those circumstances, one image only

would be visible, namely, the image at *i*, and by throwing the pictures in the stereoscope slightly out of adjustment, this may be rendered very evident by the appearance in the instrument of parts of three pictures.

The reader will necessarily now inquire how it is that a solid image, a figure having three dimensions, results from combining

ST. PETER'S, ROME.

two dissimilar pictures. We must endeavour to explain this.

Draw a circle upon paper, and a line as its diameter; place a thin straight object

upright exactly in the centre, and so that the line and the rod are both in a vertical plane passing between the two eyes. Bring the eyes near this arrangement, close the

right eye; you will see the line to the left hand of the upright; open the right and close the left eye, the line will now appear on the right hand of the rod. The image seen by

each eye is proceeding in an opposite direction, as the arrow in the woodcut on the preceding page. With a very little practice these two images may be *squinted* into one. The result will then be the same as that produced in the stereoscope, a solid arrow proceeding directly towards the eye.

Again, place a cube upon some books arranged as a flight of steps. Place the hand as a screen a short distance in front of the nose, and, shutting first one and then the other eye, make a drawing of the arrangement under each condition. The result will be what we have represented, but these will resolve themselves into a system of solids when observed in the stereoscope.

Stereoscopic pictures are, indeed, the pictures of objects as viewed with the right and the left eye respectively. We are not—until reminded of the fact—aware that we must (seeing that the pupils of our eyes are about three inches apart) view every object under a slightly different angle. Without going into the question of vision, or examining with minute accuracy the structure of the eye, it will be sufficient for our present purpose to mention the main facts.* We see, because the rays of light which fall upon any body are radiated from the surface of that body with differing degrees of intensity, these varying with the colour, condition, and contour of the surface. These surface radiations passing through the pupil of the eye, suffer refraction by the crystalline lens, and a picture is formed on the retina of each eye. By taking the eye of a recently killed animal, and cutting an opening in the upper part, through which we may look in upon the reticulated membrane, we can see the picture as in a camera-obscura. The *retina* is an extension of the optic nerve, consisting of an infinite number of the most delicate fibres, piercing through a peculiar dark-coloured pigment at the bottom of the eye. The arm and its great nerves, divide in the hand into the fingers and smaller and more delicate nerves, and with these we feel objects. Now the optic nerve, when it reaches the eye, is divided into a thousand optical fingers, which *feel* the slightest variation in the quantities or the intensities of the light-rays falling upon their extremities, and the *sensation felt* by the delicate members of the eye is communicated to the brain, and this constitutes vision, the sense of sight, the effect of a luminous cause. The pictures drawn upon the eye vary as much as is the difference of the angle due to the two passages through which the rays pass—the pupil of each eye—to the optical arrangement within, which is so exquisitely delicate and refined. Each two corresponding points of the two pictures are *seen* at the converging of the optic axes, the eyes uniting each pair of points in succession, and conveying to the mind the impression of a solid.

It is difficult, if not impossible, with the knowledge which we have of solid bodies, to ascertain the effect upon a single eye, without the interference of the mind. We immediately adjust according to our preconceived knowledge; and hence, even with one eye, men see, under nearly all circumstances, objects of three dimensions. Yet we

may prove some of the advantages of two eyes, in giving us a correct notion of solidity.

My moderator lamp is burning on the table before me. I rest my head on my right hand, and closing my right eye, mark carefully how much of the circular form I can make out, and the arrangement of light and shadow on its ornaments; without moving my head, I open the right eye and close the left. When the left eye is open I see further round on the left hand of the lamp than when it is closed; and so of the right hand side when the right eye is opened. Now, if I open both eyes, I see round on either side better than I did with one eye; I have a more distinct perception that the cistern of the lamp is round.

Now the stereoscopic pictures are the pictures of the same building, statue, landscape, or of any group of objects, as seen respectively with the right and the left eye. We have these pictures on a plane surface—mere lines and light and shadow, as we see in the woodcut, representing the Church of St. Peter's, Rome, on the preceding page.

These pictures, as previously described, are by the prismatic lenses resolved into one. Our space forbids us from entering more into detail than we have done; we feel that our descriptions are necessarily imperfect from the conciseness to which we have been compelled; we would refer those who desire to know more of the stereoscope to the prize essay on this instrument recently published by the London Stereoscopic Company,* and we would recommend the student or the amateur to visit their establishments, and examine their collection of stereoscopic views from almost every quarter of the globe.† It would be almost impossible for the most accomplished artist to draw two such pictures with sufficient correctness to produce the solid image in the stereoscope. The photographic camera, and the sensitive photographic processes which we now employ comes to our aid. A single camera obscura may be employed to take the pictures from slightly different points of view; or two cameras with lenses of the same focal length may be adjusted at the required angle.

If the object is 100 feet from the cameras, their lenses should be placed 4 feet apart; if 150 feet distant, 6 feet apart; and so on, varying the distance of the cameras, or of the points at which we place our single camera, with the nearness or remoteness of the object. By carefully examining the views of Meiringen, in Switzerland, and of St. Peter's, at Rome, which have been engraved with much precision from the immense stock of the London Stereoscopic Company, it will be seen that, as we have stated, the pictures are not identical in either case. They are, in fact, in this, as in all other examples, a pair of pictures of the same scene, and the same temple, as seen with either eye. There are various modifications of Sir David Brewster's instrument,

one of which, that by Mr. Knight, we desire specially to notice; we shall do so probably in our next.

By the extreme sensibility of the photographic processes, we are now enabled to obtain pictures of objects in remarkably short spaces of time. The moving clouds and the restless sea can equally be fixed upon our sensitive tablets, and these, viewed in the stereoscope, become so real as to cheat the senses. Under every aspect of light and shadow we can copy nature in her wildest as in tranquil moods. The humid valley, with the sinuous river, reflecting back the sun's rays more lovely than he sent them; the forest with its mazy windings, and the fitful straggles of light to pierce its leafy recesses, are brought out in the stereoscope with a magical reality. The gigantic vegetation of tropical climes, the stunted growth of arctic regions, are realised here in a way which defies the most skilful painter, and thus the stereoscope may be made the medium of conveying the best possible lessons in natural history, and by calling into play the powers of observation, greatly advance the education of the people.

By means of the stereoscope and photography, the Bible student may examine the rocks of Ararat and the plains of Mamre; the desolation which marks the submerged Cities of the Plain, and the endurance of man's work in the pyramids of the desert; the homes of the idolatrous Assyrian, and the temples of Darius the Persian. The student of profane history may wander over Marathon, and grow patriotic at the view of Thermopylae. The works of the intellectual Grecian, who breathed the breath of poetry into marble, and the efforts of the sterner Romans, who had more of the genius of war than of love in all their efforts after the beautiful, may be studied in a modern drawing-room and in the labourer's cottage.

We have heard the stereoscope called a toy; to some it may appear to be so: but, even if its charming productions are viewed in sport, there must still be drawn from it an earnest philosophy, for it must teach man to love the beautiful in nature, and to appreciate the efforts of mind in the productions of Art.

ROBERT HUNT.

[The establishment to which in this article we have directed especial attention is at 54, Cheap-side, with a branch establishment at 313, Oxford Street. Both have been studiously and very judiciously fitted up, with a view to the proper appreciation of effects, and in order that selections of subjects may be made under the best circumstances. As we have intimated, the purchaser has an enormous collection from which his choice is to be made, and varying in prices from those of a highly finished order to the plain and cheap photographs; and, as we have explained, they consist of almost every conceivable variety. To convey an idea of the immense extent of subjects would require large space; but this is not needed, as the Company have printed a somewhat extensive list. Upon the enjoyment to be derived from this new source of happiness it is needless to dilate. It is pure Art teaching all classes and orders; gratifying the best informed, and delighting the least instructed. By this means nothing is learned that must afterwards be unlearned; taste is never impaired, because nature is never misrepresented; there are a hundred ways in which we can hence derive instruction, but not one by which we can sustain injury: in short, the Stereoscope is a silent Teacher, from which only good can be obtained. In a word, the loveliest scenes of nature, and the grandest monuments of human genius, are, by the magical power of this little instrument, brought in all their reality and beauty, to our own homes and firesides. Its sources of gratification are inexhaustible, and administer equally to our delight in society and solitude.—ED. A. J.]

* Those who are desirous of examining the best authorities on the phenomena of vision, may consult the following authors:—Young's "Lectures on the Mechanism of the Eye," *Philosophical Transactions*, vol. xci.; Brewster, *Edinburgh Philosophical Journal*, vol. i.; Wollaston, "On the Semi-Decussation of the Optic Nerve," *Philosophical Transactions*, 1824; Wardrop, "On Blindness," *Philosophical Transactions*, 1836; Dr. George Wilson, "On the Extent to which the received Theory of Vision requires us to regard the Eye as a Camera Obscura," *Transactions of the Royal Society of Edinburgh*, vol. xxi.; Ditto, "Researches on Colour Blindness," *Sutherland and Knox, Edinburgh*, 1855.

* The prize offered by the London Stereoscopic Company for the best essay on the stereoscope was awarded, by Sir David Brewster (to whom the duty was confided by the Company), to W. O. Lonie, Esq., Professor of Mathematics at Madras College, St. Andrew's—one of the candidates for the chair of Natural Philosophy at the Marischal College, Aberdeen. This essay we shall bring under review in our next.

† These views, of all classes and orders, are many thousands in number; they comprise several hundred views of the Crystal Palace at Sydenham, and of the late French Exhibition; scenery in great abundance, English and foreign; historic buildings, &c. &c.; passages of great interest taken at Herculaneum and Pompeii; and views in Africa, Portugal, France, Rome, the Rhine, Venice, Florence, Padua, Pisa, Milan, Verona, Genoa, Nice, Heidelberg, Como, &c., consisting of cathedrals, statues, monuments, &c., collected with taste and care. In these are comprised the ruins of the great buildings of Rome, its forum, temples, triumphal arches, castles, &c. &c.

THE NATIONAL INSTITUTION.

EXHIBITION, 1856.

AMONG the five hundred and eighty works of Art constituting this exhibition, there is a remarkable lack of figure-subjects. What we mean by figure-subjects is, historical, poetic, didactic, or romantic narrative, carefully elaborated, but without the pedantry of Art. Who is not weary of simpering rusticity? What foreigner, on seeing our eminently rustic bias, does not at once pronounce us descended of a race purely pastoral and bucolical? Scarcely can we call rustic impersonation figure-pictures; they are brought forward without narrative past or prospective, positive or allusive. Surely the world of human incident is wide enough; it is a current that would flow on for ever with features that might be made ever new in Art. The very seductions of landscape Art lead to perfection in it; but book-lore seems repugnant to painters, hence so little advance in figure-narrative. A visitor, seeing many of the landscapes on this occasion for the first time must pronounce them of very high class; but he would hesitate to do so if he knew that the subjects and the treatment had been identical in others, which for a series of years had preceded them. They are still of high class, but the monotony is not creditable to the genius of the painters. There is in the very best of exhibitions always, necessarily, a proportion of indifferent productions, and here, of course, we find a considerable alloy. It is much to be regretted that there is so little variety with such an amount of labour; were it otherwise, this exhibition in its landscape section would be attractive beyond all the other oil-picture collections.

No. 3. 'Bretou Cardplayers,' A. PROVIS. The picture presents the interior of a French cottage, which is rendered, as to detail, with a minute truthfulness fatal to good effect; that is, too much is made of passages which had been better subdued. We need not say that the work evinces power and knowledge.

No. 11. 'Caernarvon Castle, North Wales,' JAMES DANBY. This is the well-known view, presenting the magnificent ruin laterally, and occupying the right section of the composition. It is brought forward under an evening aspect, with a flood of red and amber light, such as is often repeated by this artist. The general treatment is touchingly elegiac—but the sentiment is materially injured by the introduction of an episode of every-day life.

No. 18. 'Outskirts of a Forest,' J. STARK. There is a powerfully natural charm in the manner in which this artist defines his groups of trees—the masses of foliage are palpably distinct, and this is seconded by the chiaro-scuro alternations beneath and beyond the trees. The foliage is less fresh than that of other recent pictures. Gurth, the swineherd, might still find here ample feed for his squeaking porkers.

No. 31. 'Feeding Time,' A. WIVELL. Two children feeding chickens in a cottage. The subject is of a very ordinary kind, but it evinces independence of feeling, and is treated with a Dutch earnestness as to effect and realisation.

No. 32. 'At Rotterdam,' A. MONTAGUE. Groups of venerable and decrepit houses, all that can be desired pictorially, but, save us from the experiment of living in them. The Dutch are a clean people, but the neglected exterior of these dwellings suggests a conviction which we have been compelled, how reluctantly soever, to admit, viz., that dirtiness is more picturesque than cleanliness.

No. 35. 'Night, Moonrise—Hastings,' E. C. WILLIAMS. With respect to identity of locale, this might be anywhere on the coast. It is simply an effect according to the title—early in a summer or autumn evening; the coast material, boats, sails, figures, &c., opposed to the light sky. The picture is well cared for in every part, and as to refinement and allusive narrative, it is the best work we have ever seen under this name.

No. 38. 'A Storm Gathering on Cader-Idris, North Wales,' S. R. PERCY. In this work the solemn menace of the heavens is rendered in

most impressive terms. The mountain is already mantled in the blackest draperies of the sky, the yet unveiled portion of which will soon be shrouded by the careering clouds, the movement of which is forcibly felt. Below, the landscape is sullenly awaiting the deluge and the whirlwind. The description had been entirely sublime but for the hay-cart and its accompaniments below.

No. 44. 'Sunset—Winter,' G. A. WILLIAMS. A class of subject to which this artist generally does ample justice. We feel the intense and piercing truth of this example.

No. 47. 'The Housekeeper's Daughter,' W. DUFFIELD. The scene is the larder, the figure is therefore consistently surrounded with varieties of game, fish, and vegetables—the whole brought forward in a favourite Dutch form: that is, as it were, at a window. The tapestry is a most successful study.

No. 48. 'Nut Gathering,' F. POWELL. Two little figures, backed by a hazel brake, the leafage of which has been very studiously worked out.

No. 64. 'Cimon and Iphigenia,' F. UNDERHILL. Burlesque titles are very rarely happy. The Iphigenia of this composition is a girl sleeping at a stile, overcome by the fatigue of her day's labours in the gleaming-field. The Cimon is an uncouth peasant boy, whose broad features expand into a smile. The work is firm, vigorous, and well coloured; but we submit it had been better were Cimon absent.

No. 67. '*** * * * *,' C. ROSSITER. The subject is from a popular song,—Dame Margery sitting "in her own still room," ruffled like the wife of a Dutch Burgomaster of the time of "that Antonio Vandyke," so famous for ruffs and ruffles. The effect of the picture is injured by the overpowering quantity of white in it.

No. 69. 'Swaledale,' J. PEEL. There is much less of manner in this than in antecedent productions of the same artist; and it is throughout distinguished by an unflinching assertion of local colour, very skilfully modified by an almost palpable atmospheric medium. It is the best picture the artist has as yet produced.

No. 73. 'Evening Thoughts,' J. A. HOUSTON. Like a miniature—if it be so, it is a fair example of miniature in oil.

No. 76. 'The Burnie Side,' BELL SMITH. A study of a girl standing by the brink of a rivulet. The figure is relieved by a wild and rocky background, with the very best results.

No. 81. 'Left in Charge,' W. HEMSLEY. Two cottage children "left in charge" of an infant sleeping in its cradle. The figures and the whole of the incidents are made out with the nicest finish.

No. 85. 'Medora,' J. G. MIDDLETON. She is presented in profile; and circumstanced as if mourning the absence of Conrad. The sentiment is appropriate, and successfully worked out.

No. 88. 'The Morning Rest, in Ploughing Time—a Scene in Sussex, near Newhaven,' H. B. WILLIS. The subject is a team of oxen brought forward in a landscape, flat and unbroken; thus giving principal importance to the animals, which are really equal to anything we have ever seen in this department of Art. It is impossible that the heads of oxen could be more faithfully drawn; and the successive tones of their coats are so skilfully managed with respect to perspective gradation, that each remoter animal clearly holds a position farther from the eye. It is a work of the highest excellence of its class.

No. 90. 'Salmon with Otter,' H. L. ROLFE. "Otter with Salmon," we think should have been the title here; inasmuch as the unfortunate fish plays only a secondary and a most reluctant part. Of the salmon we need not speak: the sinister look and the predatory character of the amphibious felon are described with much truth.

No. 92. 'A Portrait,' BELL SMITH. A well-coloured and most faithful resemblance of the painter.

No. 93. 'A Derbyshire Mill—Showery Weather,' J. WRIGHT OAKES. The sky and other parts of this work are unexceptionable; the principal components lose, perhaps, importance, by the precedence given to the near foliage.

No. 97. 'Going Out,' S. E. HODGSON. A small study of a young lady tying on her bonnet at a glass. It is very carefully painted.

No. 101. 'The Falconer,' MONS. E. WAGREZ. An example of a foreign school; showing in feeling and manner the result of the study of pictures rather than of nature.

No. 112. 'A Welsh Valley,' F. W. HOLME. The haunt of the dainty kingfisher: a stream reduced to its summer limits, forcing its way over a stony bed shaded by trees; such is the nearest section of the composition; the more remote being rocky and well-wooded acclivities. The serious and earnest tone of the picture presents that simple and every-day phase of nature, which is most difficult to paint.

No. 116. 'A Bright Day on the Thames,' J. DEARLE. A section of river scenery, in which the trees and meadows are brought forward with a feeling of indisputable truth. The pale sky is reflected perhaps too vividly in the water, and there is a woolliness in the clouds which is not natural. The simplicity of the picture is its highest commendation.

No. 120. 'An English Farm-Yard,' A. F. ROLFE and J. FREDERICKS. All the material of this composition is admirably painted, especially the horses; but the manner and feeling prevalent throughout the whole are so like that of a well-known animal painter, that we had some doubt of the accuracy of the catalogue with respect to the names of the painters.

No. 124. 'Fluelieu compelling Pistol to eat the Leek,' C. ROSSITER. The Pistol of this composition is similar to that of a small picture exhibited last year. Two more figures are now added. There is a difference between this work and those previously executed by this artist; it is harder, and consequently less agreeable.

No. 127. 'An Autumnal Evening, North Wales,' J. DEARLE. We feel here that the artist has painted exactly what he saw, and no more. Composition would have supplied what composition feels to be deficient. If the woolliness of the near stones be intended to reduce their importance, the artist will find such a principle of working to be erroneous.

No. 135. 'The Heavy Burden,' J. SURTEES. A girl resting with a creel full of peat: the head is a highly successful performance.

No. 141. 'Thames Tow Barge, Shipplake, Berks,' W. S. ROSE. This picture contains much that is highly creditable: but wherefore should that which is immediately under the eye be less definite than that which is remote from it? The near masses representing herbage are almost destitute of significance for want of a few sharp touches.

No. 143. 'A Tributary of the Clyde,' W. PARROTT. An extremely picturesque subject, brought forward with such confidence of manipulation as could only be acquired by very close study on the spot.

In this room there are three screens, containing numerous small works, of which the greater proportion are in water-colour. We find among those worthy of mention—'Going to Market,' A. H. TAYLOR; 'The Crypt, Wells Cathedral,' S. RAYNER; 'Scene from the Legend of Lady Griseld Baillie,' KARL HARTMANN; 'The Principal Street in Toledo,' T. R. MACQUOID; 'The Oratory,' S. RAYNER; 'Entrance to the Fore Walk, Wotton, Surrey,' G. BARNARD; 'Flowers,' Mrs. W. DUFFIELD; 'Viola,' A. H. TAYLOR; 'Group of Wild Flowers,' Mrs. WITHERS; 'Hop Pickers,' (a very graceful composition, well considered and charmingly painted), Miss S. F. HEWITT; 'Spring Shower, Vale of Arden, Warwickshire,' CHARLES MARSHALL; 'Scene in Caernarvonshire,' A. O. DEACON; 'Strong Breeze—Scene on the Scheldt,' T. S. ROBINS; 'A Peep into a Cottage Garden,' J. D. WATSON; 'Ariel, a Sketch,' F. M. MILLER; 'Lane near Weald, Essex,' J. E. MEADOWS; 'The Coming Storm,' FRED. S. BRIDELL.

MIDDLE ROOM.

No. 299. 'In the Marsbes—Morning,' G. A. WILLIAMS. A broad and effective picture, showing the whole of the lower section with all its material in shaded opposition to the sky.

No. 303. 'One of the Ancient Rows still

remaining in Chester,' S. D. SWARBECK. A curious and unique subject, made out with the nicest attention to drawing and perspective.

No. 317. 'In the Highlands,' A. GILBERT. A large and broad composition, descriptive of the rising of the moon over lake and mountain. An expanse of water occupies the nearer breadths of the view, which is closed by high mountain ridges cutting the light sky. It is a production of much solemn grandeur.

No. 324. '*****' BELL SMITH. The story is the consultation of the flower, in order to learn the state of a beloved object's affections. It is, of course, a girl who appeals to the oracle by plucking the flower to pieces leaf by leaf. It is, we think, the most graceful picture the artist has ever produced.

No. 332. 'In the New Forest,' SIDNEY R. PERCY. In this picture the painter has withstood the temptations of *ad captandum* effect. The composition consists of a small patch of herbage cleared of timber, immediately closed in by a dense screen of ancient trees, which again are supported by remoter groups. This mere simplicity of statement is, after all, the most difficult to deal with.

No. 334. 'A Portrait,' R. S. LAUDER, R.S.A. This, like the few portraits which this artist exhibits, is endowed with that kind of intelligence which should always be, but is so rarely, a qualification of portraiture.

No. 335. 'J. Watt and the Steam-Engine—the Dawn of the Nineteenth Century,' J. E. LAUDER, R.S.A. The subject is undoubtedly of much interest; the artist has felt this, and has presented Watt a life-sized figure. He is occupied with the construction of working drawings, and leans back from the table at which he sits to watch the progress of a small steam-apparatus that is in operation near him. The picture pronounces at once its own title.

No. 344. 'Approaching Storm,' ALFRED W. WILLIAMS. A highly meritorious production, so accurately balanced both in material and chiar-oscuro, that no item of the one or passage of the other could be withdrawn without the loss being felt. It is characterised by an elevated conception beyond what we have seen in this painter's series. The cows are really worthy of a professed cattle painter.

No. 347. 'Aberdour Castle,' R. S. LAUDER, R.S.A. The subject of this picture may be simply described as a portion of a rocky acclivity overhanging the stream below. It has the appearance of having been painted on the spot, and has been realised with such surprising truth that no pebble, no blade of grass, has been overlooked. The gradual retirement of the upper portions of the ascent is most successfully represented. It is sufficiently minute to have been wrought from a photograph, but there is a mellowness about the execution that indicates rather a careful transcript from the veritable.

No. 353. 'View of the Lover's-Leap, Buxton, Derbyshire,' J. A. HAMMERSLEY. An attractive subject, very conscientiously elaborated.

No. 356. 'The Swale, above Richmond, Yorkshire, looking across the Vale of Mowbray,' JAMES PEEL. The expression of graduated distance here is at once felt as an impressive truth. The subject, it is true, is of the most captivating kind, and thus contemplated under a summer sky could inspire only poetic sentiment. The gradual melting of colour into air is most happily realised. The subject, we repeat, is really a fine one, and it has received ample justice at the hands of the painter.

No. 359. 'The Attendant at the Old Hall,' DANIEL PASMORE. An agreeable piece of composition, worked out with more care than we have before observed in the works exhibited under this name.

No. 360. 'The Sea Nymph's Repose,' J. G. NAISH. A miniature in oil, containing three nude figures: it is charming in colour; but in composition it might have been brought better together.

No. 364. 'Summer-time, and the Last Magazine,' W. M. HAY. We discover here a young lady reclining within the shade of trees, intent upon a book. The feeling of the little picture and its amount of success had been better supported by a higher degree of finish.

No. 366. 'Psyche steering the Bark of Love,' J. G. NAISH. This same barque is a shell, evidently a very bad sea-boat, in tow of the sign Pisces—two fish very like grey mullet. It is very clear that Psyche has never been accustomed to handle the tiller. It is a pleasant phantasy; but why is the tempestuous sea only indicated? "The course of true love," &c.

No. 380. 'A Breeze down the River,' E. C. WILLIAMS. There is much more dash about this work than in any other we have ever seen by the same hand. It is broad and firm: the water and the sky leave nothing to be desired.

THE THIRD ROOM.

No. 404. 'Waterfall on the Long Strath, Stonesthwaite, Borodale, Cumberland.—Painted on the Spot,' HENRY MOORE. This is an example of the severest method of truth-telling. We see from time to time works executed closely from nature, with all the parts charmingly brought together, and as much as is desirable of the *suaviter in modo*. The picture is timidly painted; but study of this kind must bear fruit.

No. 408. 'Rouen,' A. MONTAGUE. We are here looking down the river, and see at some distance the two well-known towers. The picture is slight and sketchy.

No. 412. 'Castle of Lourdes, Pyrenees, France,' A. F. ROLFE. The castle is a fortress of some historical importance, having been ceded to the English as part of the ransom of the French King John. The site, surrounded as it is by lofty mountains, is one of the most picturesque imaginable: these reasons are sufficient to render the picture interesting.

No. 428. 'Hôtel de Ville and Petite Place, Arras,' L. J. WOOD. The Hôtel de Ville, which is partially in shade, is really most conscientiously detailed. The gaunt *alignement* of gables on the opposite side is described with great truth.

No. 429. 'Evening,' H. BRITTON WILLIS. We are here introduced to a *riposo*, an evening picnic of milky mothers that have settled for the night on a small peninsula of herbage, past which flows a wide and deep river. We could scarcely have believed that a small society of cows could interest us so much. It is the best cow picture we have of late seen. Many of our best friends will go to grass for many a summer before they will paint in this way.

No. 430. 'Homestead,' A. R. ROLFE and J. FREDERICK. The subject is a farm-yard and buildings, over which rises a screen of stately elms. The life of the composition is constituted of horses, fowls, and pigs, all of which are carefully drawn.

No. 432. 'Moel Siabod from near Bryntyrch, North Wales,' F. W. HULME. The whole of the near section of this composition is a water surface—a broad current flowing down to the frame. This is closed by rocks and trees, which retire in various forms, until the eye is led to the peak of the mountain, over which is passing an array of dark and yet darker clouds. So masterly is every passage of this work, that we cannot commend it too highly.

No. 444. 'On the Coast near Edinburgh,' EDWARD HARGITT. A study of a small section of sea-side scenery, very pleasing in colour, but in a desire to express breadth definition of parts has been lost sight of.

No. 446. 'Fruit,' W. DUFFIELD. A composition containing the usual varieties. The white grapes, especially, are deliciously painted.

No. 448. 'View of the Undercliff, near Bonchurch, Isle of Wight—Sandown Bay and Culver Cliffs in Distance,' painted from nature, J. E. MEADOWS. This is a faithful description of the character of the Undercliff, and a great merit of the picture is the successful expression of distance, with the maintenance of local colour.

No. 461. 'Dutch Vessels entering the Port of Lillo, on the Scheldt,' T. S. ROBINS. We are at once sensible of the breeze which here sweeps the sky and the surface of the water. It has been the desire of the painter to sustain this throughout, and the result is most successful.

No. 466. 'Place Cordelier, Dinant, Brittany,' L. J. WOOD. This artist really makes a great deal of these studies of ancient architecture.

They are admirably drawn, and although every stone is individualised, the most perfect breadth is preserved.

No. 472. 'The Angler's Haunt,' H. B. GRAY. The trees in this composition are less open to exception than the other principal parts. The bridge is unduly hard and sharp, and the water is opaque.

No. 475. 'Abbeville,' A. MONTAGUE. The cathedral of Abbeville can never be mistaken; the groups of houses want definition.

No. 478. 'Au Orange Girl,' JAMES COLLINSON. This picture is marked "unfinished," but certainly it cannot be the brick wall in front of which the girl stands, for every brick has received ample justice. The figure is very earnestly painted, but it ought to have been brought out from the wall.

No. 484. 'The Beeches, Winter Morning,' H. H. HORSLEY. Two beeches are the principal feature of this wintry landscape, they have been worked with the most exemplary patience.

No. 490. 'The Evening Walk, Malvern,' CHARLES COUZENS. A small, full-length figure, evidently a portrait; it is severe in taste, but distinguished by much graceful simplicity.

No. 495. 'The Dell, Derbyshire,' J. A. HAMMERSLEY. A study closely imitative of nature; the weedy foreground is the most striking passage of the composition.

No. 499. 'Coming Events cast their Shadows before,' H. L. ROLFE. The coming event here is a stealthy cat, which we know to be approaching the larder, because the animal's shadow is on the wall. Grimalkin will have two courses—enough to satisfy any moderate cat. The salmon and the birds—especially the former—are painted with the truth which characterises all the artist's works.

No. 502. 'The Grave-digger's Riddle—Hamlet, act v. scene 1,' H. STACY MARKS. These two figures are extremely hard in execution—a disqualification which deprives finish of all its value. The church is rendered exactly, with all its mortar and minute flints—a passage of the picture which entirely supersedes the figures.

No. 509. 'Evangeline,' H. BARNARD. The figure is erect, in a contemplative pose; the drapery wants breadth, but there is in the work the feeling of a good picture.

No. 512. 'The Barmouth Valley, North Wales,' SIDNEY R. PERCY. A large canvas, showing a romantic section of lake and mountain scenery. The rough and broken foreground, with its rank grass, repeats a feature which in the series of this painter has always been remarkable.

No. 516. 'Interior of a Welsh Cottage,' C. OAKES. Somewhat more freely painted than others that have preceded it. The life of the composition is the cottager's wife contemplating her child on the ground as she sits at her wheel.

No. 521. 'Avenue from Nature,' EDWARD HARGITT. As to careful manipulation, the work is unobjectionable; but the hue of the foliage is too crude and metallic for the young green of trees; the masses also require separation and variety of disposition. The artist succeeds better in landscape breadths.

No. 528. 'The Terrace, Old Manor House—Warlaxton, Lincolnshire,' DANIEL PASMORE. A very pleasing composition, much in the feeling of the French school. It is what it professes to be—a representation of an ancient mansion, on the terrace and in the gardens before which, are strolling numerous groups of figures, attired in the costume of a period in which the mansion may be supposed to have been in its palmy state.

No. 541. 'Grassmere, Westmoreland,' Mrs. W. OLIVER. A small round picture, gracefully composed, having a mass of near trees and underwood, which very effectively assists the distances.

No. 543. 'The Bullfinch's Throne,' BENJAMIN WILLIAMS. The bullfinch is perched on a spray of apple blossom, of which every leaf has been scrupulously studied from nature. The bird is well drawn, and the idea is pretty and original.

No. 551. 'Commoners,' W. H. HOPKINS. These are two donkeys, the property of a neighbouring

encampment of gipsies. The animals look too well-conditioned to be the property of this vagrant race.

No. 552. 'River Seene, North Wales,' P. WEST ELEN. The water-course winds downward, occupying the nearest breadth of the canvas. The work presents the distinctive character of the best passages of Welsh scenery. The view is closed by mountainous ridges, to which the eye is skilfully led by intermediate gradation.

No. 562. 'Near Goatfell, Arran,' EDWARD HARGITT. In this picture the proposed distances are painted so substantially, that they do not retire sufficiently. It is a wild and very attractive subject, rendered with appropriate feeling, and in a manner original and independent; but the distances almost vie for precedence with the foreground.

No. 563. 'El Bucks on the Lodder,' R. BRANDARD. This has very strongly the impress of nature—but it is rather cold in colour.

No. 567. 'Autolykus as the Pedlar,' H. STACY MARKS. It is much to be regretted that the result of a determination to finish should so frequently end in mere hardness. The whole of the picture is very minutely manipulated; but the lines are unusually severe.

No. 573. 'The Nest,' ELIAH WATTOW. It is that of a hedge-sparrow, surrounded by flowers of white and pink May; but the flowers are too large—they rival the eggs in size, whereas they should be much smaller; but the whole is worked out with the most conscientious exactitude as to detail.

The sculptural productions are only five in number. 'Paolo e Francesca di Rimini,' a group in plaster by ALFRED MUNRO, two small figures in the act of interchanging those endearments which consigned them to that circle of the Inferno in which they were found by Virgil and Dante. 'The Spirit of Nature,' a small female figure in plaster, broad, and essentially modern in taste, also by ALFRED MUNRO. 'The Sea-Nymphs discovering the body of Lycidas,' 'The Brothers in Comus,' and 'The contest between Good and Evil,' three bas-reliefs by F. M. MILLER, characterised by infinite elegance and refined feeling.

As we have already said, the prevailing feature of this exhibition is its landscape, in which, notwithstanding the identity of which we have complained, there is a great amount of excellence: the number of exhibitors' works is increased, but the proportion of striking figure-compositions is not proportionably augmented.

THE CRIMEAN EXHIBITION.

SUCH is the name given to a collection of pictures and drawings, exhibited at 121 Pall Mall, having especial reference to the late campaign in the Crimea. The drawings by Mr. SIMPSON amount to ninety-one; affording views of every point of interest connected with the recent operations. The pictures are only three in number; a full-length portrait of the Queen, painted by Mr. CATTERSON SMITH for the Corporation of Dublin; and two large pictures, 'The Battle of Inkermann,' and 'The Battle of Balaklava,' by Mr. E. ARMITAGE. For the portrait by Mr. SMITH, the Queen condescended to give fourteen sittings. The composition is extremely simple, as the accessories are few and unobtrusive. Her Majesty is standing on a dais, with the head turned slightly to the right, and wears a dress of plain white satin. We think it one of the best portraits of the Sovereign we have yet seen. 'The Battle of Inkermann' is represented as at near the close of that dire and sanguinary conflict, the time being about ten o'clock, when the Zouaves are just coming into the action, which had been sustained already for hours by our troops. We are placed near the sand-bag battery; and the immediate ground is occupied by the Grenadier Guards, who seem to be engaged with the enemy while yet in column. If this be not the disposition, it should not seem so: we are certainly not at the

head of the column, because the columns which are before us are with the centre companies. It is true that in this, the "soldiers' victory," there was nothing of the military pedantry of a Hyde Park Review; and, in the fearful pressure of these few awful hours, it is impossible to say into what anomalies of formation a battalion may have fallen. We think the artist conveys an imperfect conception of the battle, in one of the main principles on which he has worked. It is historically true that our troops were opposed to, and beat an overwhelming force of the enemy; but the vast disproportion does not appear in the pictures. We can perfectly understand the predilection of the painter for large figures; but, perhaps, with all the facilities which he has enjoyed, it might have been better to have shown more of the field, and more of the dispositions of the enemy: this would by no means have enfeebled his description of any one of the incidents he has introduced. On the high ground, which, from this view of the field, closes the composition at a little distance from the foreground, is seen the Duke of Cambridge with Major Macdonald; and in the *mêlée* before us, is Colonel Liudsay cheering on his men; also Captain Peel of the navy, followed by a midly—volunteers on this occasion. A great many of the men, Russians as well as English, are portraits; and, if the representatives here be according to natural truth, which we believe must be the case, from the opportunities which the artist has had of arriving at facts—the Russians in anything like equality of force can have no chance in front of our stalwart grenadiers, or even of our line regiments, of which so many are essentially grenadiers. The morning of that memorable fifth of November was rainy and dark, the aspect of the sky is therefore clouded, and the general appearance of the field excessively dreary. The men on both sides are fighting in their great coats: the Russians wearing flat-topped cloth caps, and our own people, of course, their bearskins. Throughout the picture there is an entire suppression of colour—this, consistently with truth, could not be otherwise; but where colour might with propriety have occurred, as, for instance, in the standard, it is even then reduced, in order that there may be no relief to the impression which, it is at once felt, is intended to be conveyed. In the Cavalry charge at Balaklava, the troops immediately engaged are the Scots Greys, and the 6th Dragoons, led by General Scarlett, who is himself penetrating the enemy's lines. Major Clarke, of the Scots Greys, is also a prominent figure. The troops with whom these regiments are engaged are Russian Light Cavalry, in grey or light blue uniforms, who, neither men nor horses, can make any stand against such force of bone and muscle as our troops bring against them. As in the other picture, the figures are large, only a very small section, therefore, of the battle can be shown. The figures are many of them portraits, and the ground is most accurately painted. Mr. Simpson's sketches are very interesting; there is not a spot associated in anywise with the history of the Crimean campaign that is not commemorated. A few of the sketches describing certain of the most remarkable localities may be mentioned, as—'The Interior of the Malakoff,' 'Interior of Fort Nicholas,' 'Ditch of the Bastion du Mât,' 'The Interior of the Redan,' 'Attack on the Malakoff,' 'The Battle of the Tchernaya,' 'The Interior of the Mamelon Vert,' 'Charge of the Light Cavalry Brigade,' 'Charge of the Heavy Cavalry Brigade,' 'The Docks, &c.,' 'Entrance to Excavation, at Inkermann,' 'Admiral Lyons and Staff,' 'The Valley of the Tchernaya,' 'Camp of the Light Division,' 'The Town Batteries, or Interior fortifications of Sebastopol,' 'Funeral Cortège of Lord Raglan leaving Headquarters,' 'Prince Woronzoff's Palace,' 'Sebastopol from the Sea,' and a large and highly-finished drawing showing the retreat of the Russians to the North-side, with Sebastopol blazing like one vast furnace in their rear. These engravings are executed on tinted paper, the lights being put in with white; they are unexceptionable in execution, and of their truthfulness there can be no question.

ART IN CONTINENTAL STATES.

PARIS.—The splendid stained glass windows, formerly removed from the church of Notre Dame, because they obstructed the light, are to be replaced; this is a proof of good taste, as they are magnificent specimens of a former age.—The Tour St. Jacques de la Boucherie is nearly completed; stained glass windows are being placed, and the square round the tower planted with trees; the whole has a fine effect.—A splendid cradle is being constructed for the imperial infant; the body is in the form of a ship (the arms of Paris) richly ornamented with sculpture and enamel. The artists employed on this unique "domestic" object are Messrs. Baltard, Simart, Jacquemart, Gallois, Grohé, and Froment-Meurice.—An Art-exhibition is projected at Vienna; the paintings, by Winterhalter, of the Empress Eugénie, exhibited in Paris last year, are to be, by special request, forwarded to that town.—Lotteries are quite the fashion here; the various articles presented to the nation by artists and manufacturers after the close of the Grand Exhibition, will be put up as prizes in a lottery; the proceeds are for the widows and orphans of the army of the Crimea.—A shield in bronze has been presented to the Baron C. Dupin (chief commissioner at the London Exhibition, 1851); it is executed by Lienard, Froment-Meurice, and H. Plon.—M. Préault has just finished a statue of Le Notre for the government.—The bust of Leopold Robert has been placed in the Louvre; it is by Adam Salomon.—The "Death of Patroclus," by Gérard, has been sent to the Museum at Tarbes.—The cross taken at Sebastopol by the French, in the church of St. Vladimir, has been placed in the Musée de Cluny.—Horace Vernet is busy painting the "Battle of Alma."—The whole ornamental part of the Louvre has been reproduced in photography, by order of M. A. Fould.—It is said that the Emperor has demanded from the civic authorities of the Hotel de Ville all the ancient plans for the embellishment of Paris; if this be true, the whole of old Paris is to be pulled down, and a new city built. The works are to be undertaken by three companies, and the estimate of the cost is at least 800 millions of francs.—At a sale of pictures belonging to M. Barollet, the opera singer at Paris, a few days ago, some Watteaus were disposed of at high prices—namely, one, representing "The Alliance of Music and Comedy," at 160*l.*; another a portrait of "Mme. Julien" in mythological costume, at 158*l.*; a third, "Clytie Adoring the Sun," at 158*l.*; and "Le Glorieux," at 36*l.* At the same sale a "Triumph of Venus," by Boucher, fetched 120*l.*; "The Mountebanks," by Callot, 158*l.*; "The Silver Goblet," by Chardin, 80*l.*; a portrait of "Louis XVI.," by Greuze, 94*l.*; "The Pied de Boeuf," by Lancret, 158*l.*; "The Unfortunate Author," by Prudhon, 118*l.*; "A Charge of Cuirassiers," by Charlet, 38*l.*; "Maternal Care," by Frayonard, 29*l.*; and "The Caravan," by Marrithal, 55*l.*—At another recent sale in Paris, twenty-eight small landscapes, by Breughel, were sold for 440*l.*; "An Interior of a Church," by Peter Neuss, 18*l.*; "An Interior of a Cathedral," by the same, 19*l.*; "Politicians in the Garden of the Tuileries," by Bailly, 19*l.*; "Flowers on Porcelain," by Prêtre, 30*l.*; "The Chamber of Jesus," by C. Dolce, 16*l.*; "A Holy Family," by Maratti, 25*l.*; "The Marriage of St. Catherine," by Beschey, 16*l.* 10*s.*; and "The Adoration of the Magi," by Tiepolo, 17*l.* At the same sale some works in ivory were disposed of, and amongst them were an "Ascension of Christ," 38*l.*; an "Adoration of the Shepherds," 19*l.* 10*s.*; "Birth of Christ," 35*l.* 10*s.*; a small "Christ," 34*l.*; and a "Calvary," 27*l.* 10*s.*

CARLSRUHE.—We hear, says the *Literary Gazette*, that a work of Art, just arrived from Rome, is creating much attention there. It is a statue of a young violin player, executed in Carrara marble by Herr Steinhäuser. The subject would seem most unsuited to sculpture; but it would appear that the artist has completely conquered the difficulties in his work. The statue, placed on a pedestal of red marble, represents a youth of the size of life, draped in a cloak cast over the left shoulder, which envelops the body, and descends to the knee. The attitude of the head, and expression of the face, denote the moment of rapt inspiration as he is about to sound his instrument. The bow and strings of the violin are of bronze. The statue is the property of the Prince Regent, who does everything in his limited power to further Art in his states.

COLOGNE.—The provincial government of Cologne, we learn from the *Builder*, have ordered M. Hohe, professor of drawing, to copy and trace the old mural paintings of St. Gereon's Church. They

belong to the thirteenth century, and are conspicuous for correct design and brilliant colouring, and represent figures of saints, above life size; containing also the apocalyptic signs of the evangelists, who stand in the niches of the chapel. The surrounding ornaments are in the Romanic character, passing somewhat into the Gothic.

ART IN THE PROVINCES.

WARRINGTON.—The council of the Warrington School of Art report that the prospects of the school at the close of the first year of its perfectly independent existence are most gratifying in every respect. The school has now fully overcome the difficulties that beset such an institution at its outset, has won general confidence, has enlarged the sphere of its labours, and now really promises a future of stability and permanent usefulness. The year has been an eventful one; and though sometimes difficulties have gathered, the very efforts that have been necessary to overcome them have done much to spread a knowledge of the advantages of the institution, and to enlist public sympathy in its behalf. The attendance of students at the central school during the year has been as follows:—Special Class, males, 16; females, 26. Public Day Class, males, 25; females, 11. Public Evening Class, males, 45; females, 2. The entire number of students who have attended the school during the year is—Males, 86; Females, 39. Total 125. The relative merit of the works of the pupils has been impartially tested by examiners appointed by the Board of Trade in the three public exhibitions of students' works which have been held in London since the date of the last report of the school. Medals were awarded in those exhibitions to thirty-four works of the Warrington students, a number greater than that awarded to any school of the same age, even in large towns, and exceeding in some cases the number granted to the old-established schools.

PLYMOUTH.—The school of Art in this town progresses so satisfactorily that the accommodation at present provided does not meet its necessities, so that the committee have been compelled to refuse a considerable number of applicants for admission.

BATH.—The committee who manage the agreeable *réunions* at Bath exert themselves most laudably for the advantage of their visitors. The third conversazione of the season, which took place on the 11th of March, attracted much interest from the large number of excellent paintings and drawings lent for exhibition; the most valuable of these were contributed by Mr. Wallis, who sent Macise's "Veiled Prophet" and "Spirit of Chivalry," Ary Scheffer's "Francesca di Rimini," Rankley's "Dream of Hope," F. Goodall's "Raising the Maypole," a small *replica*, with some slight variations, of the larger work; Linnell's "Windmill," Wilkie's "Alfred in the Neatherd's Cottage," drawings by Austin, Turner, Stanfield, Muller, Chambers, W. Goodall, Hall, Hunt, Rayner, D. Cox, sen., T. S. Cooper, Bright, Salmon, Lewis. Among other works deserving of especial notice were "The Halt of a Party after a Day's Sport in the Highlands," by J. F. Herring; "Sunset at Sea" and "Isola del Pescatori," by G. E. Herring; "Sea Coast" and "Stepping Stones," by T. Danby; "Roses," by Miss A. Muttie; "The Gardener's Store-room," G. Lance; "The Mill" and a "Landscape," by Bright; two "Views in North Devon," W. Muller; "The Mill-tail," G. Frupp; "Coast Scene," T. B. Aylmer; "Child mourning over a dead Bird," Sant; "The Deer-Leap," and others, by H. B. Willis; some interiors by Helmsley and J. and D. Hardy respectively; water-colour drawings in frames by Collingwood Smith; and in portfolios by Bennett, McKewan, Soper, Jntsum, Stephanoff, &c. &c.

TRURO.—The ladies of the morning class of the School of Art have presented to the master, Mr. G. R. Gill, a silver-mounted dressing-case, as a mark of their esteem for his manner of conducting their studies. The progress of the class it refers to affords much satisfaction, we are told, to the promoters of the school.

CLIFTON.—The first conversazione for the season of the Bristol and Clifton Graphic Society took place on Tuesday evening, the 4th of March, at the Victoria Rooms, Clifton, and was well attended.

WORCESTER.—The Society of Arts of this city gave a *soirée* on the 26th of February. The great feature of attraction were the pictures selected by the Art-Union of Glasgow. M. De Poix Durieux during the evening read a paper on Art, which was listened to with much attention.

THE ROYAL PICTURES.

GENEVIÈVE OF BRABANT.

G. Wappers, Painter. J. C. Armytage, Engraver.
Size of the Picture, 2 ft. by 1 ft. 5½ in.

BARON GUSTAVUS WAPPERS, an artist whose merits have procured him from his sovereign an honourable title, was, till recently, President of the Academy of Arts of Antwerp, in which city he was born in 1803. He was a pupil in the school of which he afterwards became the head. In 1821 and 1823, he contended, but on both occasions unsuccessfully, for the prize which would have sent him to study at Rome: being frustrated in his desire to become acquainted with the great masters of Italy, as they are seen in their own country, he applied himself assiduously, under the direction of M. Herreyns, to the study of those works which were within his immediate reach—the pictures of the Flemish painters, especially those by Rubens and Vandyke. Subsequently he went into Holland to look at Rembrandt, and to Paris for the purpose of seeing the Italian pictures in the Louvre. But the style of this artist inclines far more to the Dutch and Italian schools than to that of Italy.

In 1833 he exhibited at Antwerp a large picture, painted for the church of St. Michael at Louvain. The subject is "The Entombment." The composition of this work is fine, but the colouring is somewhat over-done, a fault pardonable in a young artist whose enthusiasm was not yet tempered by judgment. An incident in the last Belgian Revolution, "The Populace tearing down the Proclamation of Prince Frederick in the grand square of Brussels," gave him, in 1835, a subject of another large work, which, in all the essentials of good painting, showed a marked superiority over the preceding picture: while his exhibited production of the following year, "Charles I. taking leave of his Family," manifested a striking advance in the powers of the artist. "M. Wappers," wrote a foreign critic some years back, "has in this picture really shown himself a great poet: it is impossible to be more poetical, more profound, more noble, and more truthful at the same time. The canvas is a complete poem,—it is full of thoughts finely rendered."

We may mention among his other historical pictures, as especially entitled to honourable mention, his "Anne Boleyn;" "Charles IX. on the Eve of St. Bartholomew;" "The Massacre of the Protestants;" "Charles VII. and Agnes Sorel;" "Heloise and Abelard;" "Peter the Great at Saardam;" "Louis XI. witnessing a Fête-Champêtre;" "The Temptation of St. Anthony;" "The Defence of Rhodes against the Saracens by the Chevalier Faulques de Villaret," painted in 1848, by order of Louis Philippe, for the Palace of Versailles; &c. &c. The portraits by Baron Wappers are not unworthy of the great master whom he has most studied to follow in this branch of Art—namely, Vandyke.

This picture of "Geneviève of Brabant," painted in 1845, was, we have heard, a gift from the painter to Prince Albert, as a birthday present to her Majesty. The subject is taken from an old Flemish legend, as popular in that country as the "Babes in the Wood," or any other, is in our own. Geneviève, driven from her home, through a false accusation, while her husband, the Count of Brabant, is engaged in the Crusades, is forced to take refuge, with her infant, in a cavern, where a hind daily ministers to their sustenance. She is represented in the picture at the entrance of the grotto, which opens towards a forest; the child is resting in her lap, the hind at her feet. The cavern is illumined by the brightness of day, and the painter, in a happy mood, has concentrated the rays of light chiefly upon the child's face. By this his idea is sufficiently illustrated. Though Geneviève's head is shaded, she does not look up painfully, nor does she appear as suffering from mental disquietude: her thoughts are with her child, who, blessed with health and infantine beauty, is her comfort and joy in these dark hours of her history.

The picture is in the collection at Windsor.

EXETER HALL

ON THE ELEVENTH OF MARCH.

THE great London world knows that, on the evening of the eleventh of March, Mr. and Madame Goldschmidt gave a concert at Exeter Hall, devoting the whole of the *receipts* to the NIGHTINGALE FUND. Some months have elapsed since this was determined on, and the manner of the "doing" has been worthy of the doers, and of the cause: the public saw the effect; but only those who were so fortunate as to be "behind the scenes" can thoroughly appreciate the sacrifice, the earnestness of purpose, the care and pains bestowed in "getting up" the concert. Indeed, the rehearsals were as well worth hearing as the concert itself—in some instances better: for Madame Goldschmidt did not hesitate to sing over and over again, not only passages but pages, when the accompaniments wanted perfecting; these repetitions were given with as much strength and expression as if the "public" were present; hour after hour passed away, but Mr. and Madame Goldschmidt remained with Mr. Benedict, labouring for the completeness of the whole.

The evening concert was also distinguished by another mark of this desire for perfection: not only did it present the mingled attractions of Beethoven, Mozart, Mendelssohn, Rossini, Weber, and Meyerbeer, but Mr. Goldschmidt had reserved the first performance of what may be called a miniature Oratorio of his own composition for the occasion; thus adding a decided novelty to the attractions of "the world's favourites."

Mr. Goldschmidt's reputation as a *pianist* has increased with every performance; the selection of his subjects is evidence of his school, and of his taste: but to thoroughly appreciate the tenderness and delicacy of this *artiste's* piano-forte playing, he should be heard in a less spacious concert-room; for though his finger is sufficiently eloquent and powerful to fill Exeter Hall in the stronger parts, yet the hall is ill adapted for the conveyance of those delicate phrases—those soft and exquisite passages—which Otto Goldschmidt renders with such perfect sentiment—such marvellous depth and tenderness of feeling and expression.

Taking the 130th Psalm as his text, Mr. Goldschmidt's introduction was prayerful and fervent: the preface to a pleading and pathetic melody, "From the deep I cry unto thee, O Lord," which was exquisitely and truthfully rendered by Madame Goldschmidt; this was followed by a chorus, founded on Martin Luther's *Chorale*; then came a short interlude, preceding a delicious chorus of female voices:—

"See all the lilies clad in glory,
They labour not;
See all the birds that fly before thee,
They gather not;
Yet the Lord maintaineth them,
His mighty hand sustaineth them;
Say, art thou not more than the flowers he unfoldeth,
And more than the birds he upholdeth?"

The effect of this chorus was all that could be desired; and the applause was only partially subdued, despite the "time-honoured" custom of not applauding sacred music.

The duet between Madame Goldschmidt and Mr. Swift, which immediately followed, sustained the character of the composition; while the chorus for male voices that burst forth at its conclusion, freely expressed the hope and mercy which the words conveyed.

The *Arioso*, sung by Madame Goldschmidt, with obligato accompaniment on the clarinet by Mr. Lazarus, relieved the chorus, and was exquisitely given; we could have wished it prolonged; but the composer revels in multitudes of voices and instruments, perfectly acquainted with the power and extent of those he calls into action: all is commanded by a master's skill; each plays its own part towards the perfecting of the whole; and, if we felt the first chorus drag a little before its conclusion, the last left us positively nothing to desire but its repetition.

Without being professedly critical in things musical, we can hear ample testimony to the poetic conception and fulfilment of this varied

GENEVIEVE OF BRABANT.

FROM THE PICTURE IN THE ROYAL COLLECTION

and beautiful composition; giving sound and voice first to the earnest prayer, then to the evidences of Almighty goodness; and, lastly, to the exulting triumph, springing from faith, in the "Great Shepherd." We have reason to rejoice that Mr. Goldschmidt has contributed so effectively to our store of sacred music; and to thank him for the graceful homage rendered to Miss Nightingale, by producing what was in itself so pure and holy for such an occasion.

Nothing could be more rich and varied than the first part of this unrivalled performance. The test of the musical standing of an audience is in their appreciation of instrumental music; "a song" hushes even the least initiated into silence; but it is only an educated and comprehending audience that are "hushed as the grave," when Beethoven and his compeers speak; England is still in its noviciate as a musical nation. Paying for a thing and appreciating it are two distinct matters; but the more we advance, the more thoroughly shall we comprehend the rendering of the compositions of the old masters, by the hands of such conscientious and faithful musicians as Mr. Otto Goldschmidt.

The second part of this deeply interesting concert was hailed by the most vigorous applause—the audience, freed from the restraint of custom, indulged their enthusiasm; all could wonder at and admire the miraculous vocalisation of Madame Goldschmidt in "Squallida veste e bruna;" it was a concert in itself, giving ample proof that while her voice has not lost a shadow of its eloquence and beauty, it has gained in strength, and even in extent. Her singing in the trio for a soprano and two flutes, has achieved popularity throughout Europe and America; and the concert wound up gloriously by the world-famous solo quartette and chorus "Alziam gli evviva," from Weber's "Euryanthe."

Charming as was all—perfect of its kind—a leader of rare and varied accomplishments, unsurpassed artists and orchestra, a well-trained chorus, and a brilliant audience—there was a purpose about this concert more grand in its simplicity than anything that has hitherto been felt or known in England. A country gentlewoman, moved by the spirit of Samaritan Christianity to devote herself, while in the bloom of womanhood, to the alleviation of suffering and the amelioration of the necessities of the poor, trains her accomplished mind to the duties of a nurse. She seeks abroad the information which, to our shame be it spoken, she could not find at home, by the power of a mind which, seeing that its attributes are purely feminine, it would be an offence to call "masculine." She saw, combined, considered—and, freighted with her slowly but surely developed purpose, she returned, not to the ease and luxury of her beautiful home, to visit the sick in "silken sheen," and talk over her "experience" in "county families," but to alleviate the sufferings of the "poor gentlewoman," in an asylum which she undertook to superintend, reorganise, and assist to support. This was all done without sound or parade—none had then heard the name which has since been hailed as the one unsullied glory of our war: there she watched and waited, not as a lady, but as a woman; never perhaps thinking of the gifts which were working out a destiny, the most glorious that ever fell to woman's lot. When the time of her country's struggle arrived, the path she considered duty lay wide and broad before her. Many devoted women desired to combine with her, and others followed in their wake. Mr. Sidney Herbert saw the bane and antidote,—to him we are indebted for appreciating Florence Nightingale when her name was hardly known in her new calling, beyond the refuge where she succoured and saved—he knew her purpose, knew her strength, knew that England could trust her. And she went with one or two friends, and a band of women—all prepared to devote themselves for the honour of their country and the good of mankind!

But all words concerning this admirable woman are now needless; the world feels, appreciates, and acknowledges the debt the world owes her; to the thousands who have derived health and life from her labours may be added

—in the prospect—the hundreds of thousands of the hereafter. It is a glory to have aided the future of such a woman, while recording homage and gratitude for the past.

But in the matter to which we now more immediately refer, there is something inexpressibly gratifying: Mr. and Madame Goldschmidt are foreigners; they cannot, either indirectly or directly, derive comfort or advantage from the Institution Miss Nightingale is to form—except in their large love of humanity, and their abounding desire to do good. Yet see what they have done for the Nightingale Fund! The concert realised a sum of no less than 1,872*l.* 6*s.*, that is to say, such was the sum paid by the attendance, for Mr. and Madame Goldschmidt would permit no deduction on account of the necessary expenses: these expenses they paid themselves, and they exceeded in amount 560*l.* Had they contributed only this 560*l.*, it would have been a noble contribution! As it is, it is without parallel: so grand and graceful a gift of homage from one woman to another has never been recorded.* Surely this great example must spread: surely there will not be a woman in the British dominions who will not—as far as her means permit her—"do likewise!"

A. M. H.

THE ARTISTS' GENERAL BENEVOLENT FUND.

THIS very valuable society had its anniversary festival on March 15. We have so often directed attention to its claims and merits, that our duty may now be discharged by simply recording its progress. Since its institution—so far back as the year 1814—it has relieved a large amount of suffering; and although it is, very properly, a principle not to publish the names of those who are relieved or assisted, we speak within our own knowledge when we say that among the "cases" are many of a deeply touching and highly interesting character. Our readers are aware that this society differs from "The Artists' Benevolent Fund," inasmuch as it is open to all applicants—artists, their widows and orphans, who are in difficulties or distress; while "The Artists' Fund"—an admirable institution—does not, and cannot, afford relief to any who are not of its subscribers. The dinner on the 11th was well attended; the President and eight or ten members of the Royal Academy being among the guests. Lord Stanley discharged the duties of chairman with remarkable felicity, and with considerable eloquence; he was ably supported by the Earl Stanhope, who made the very gratifying announcement that the sum acquired by the forthcoming "Life of Sir Robert Peel"—the production of which from the great and good statesman's papers had been entrusted to him and Mr. Cardwell—was by his directions to

* We print with much pleasure the following "acknowledgment," which has been circulated by the Committee:—

"THE NIGHTINGALE FUND.—5, Parliament Street, March 17, 1856.—The Committee of the Nightingale Fund have the gratification to announce, that they have received from Mr. and Madame Goldschmidt the munificent contribution of 1,872*l.* 6*s.*, being the proceeds of the concert given by them at Exeter Hall, on Tuesday, the 11th of March.

"This amount is free of all deduction on account of the expenses of the concert, which have been entirely defrayed by Mr. and Madame Goldschmidt.

"The contribution is presented by Mr. and Madame Goldschmidt as a testimony of their warm interest in the purposes to which the fund is destined, and of their sympathy and admiration towards the lady whose name it bears.

"The Committee feel that any observations would be superfluous, but they cannot issue this announcement without expressing their belief that this act of Christian sympathy on the part of an accomplished foreign lady, marking her appreciation of the services of one of her own sex, and of the benevolent and useful purposes to which the fund is appropriated, cannot fail to call forth new and increased exertions on the part of all the countrywomen of Florence Nightingale.

"MOSTEAGLE, Chairman.
"SIDNEY HERBERT, } Hon.
"S. C. HALL, } Secs."

be divided among several charitable institutions—of which the first hundred pounds was then and there presented to "The Artists' General Benevolent Fund." A scarcely less gratifying announcement was made in the Hall: two very beautiful engravings have been given to the society by Lord Yarborough; one of these, the far-famed "Wreck of the Minotaur," was exhibited in the room. This most liberal and valuable aid to the society was communicated by his lordship in a letter to the President of the Royal Academy, of which we are permitted to print a copy:—

MANBY HALL,
BRIGG, Nov. 3, 1855.

DEAR SIR CHARLES,—

Some three years ago I presented to Mr. Charles Agar, of Manchester, the copyright of "The Wreck of the Minotaur," which he undertook to have engraved for general distribution.

Since then, circumstances have occurred which have induced me to make arrangements with him for the purchase of the engraved plate. In consideration of the benevolent object for which it is my intention to apply it, he kindly resigned any pecuniary advantage to be derived therefrom.

The position you occupy as President of the Artists' General Benevolent Institution, induces me to address you, to ask your assistance in enabling me to carry out to the fullest extent a scheme I have in view—viz., to assist deserving but distinguished artists, their widows and orphans.

With this object I propose to present to the Artists' General Benevolent Institution the copyright and two engraved steel plates from pictures in my own possession. The one, "The Wreck of the Minotaur," on the point of completion by Mr. T. O. Barlow: the other, "The Opening of the Vintage of Mâcon," which engraving the same gentleman has engaged to complete by the 19th of September, 1857. Both these pictures, as you are doubtless aware, were painted by the late J. M. W. Turner, R.A., and under the following circumstances.

My grandfather, with two other noblemen, subscribed a sum of money to enable Mr. Turner to travel, and take advantage of the opportunities then offered to artists to study the works of old masters. Whilst so travelling—I think about the beginning of this century—he painted the latter picture, styled "The Opening of the Vintage of Mâcon," of which a relative of mine wrote to me in 1851:—"Turner's own description, some thirty or forty years ago, was 'Between Chalons and Mâcon;' at that time it caused a great sensation." I believe that picture was painted about 1807, and then purchased by my grandfather. The other picture, "The Wreck of the Minotaur," was painted for my father, I believe, about the year 1811.

In the *Naval Chronicle*, at vol. xxv, page 56, a description of the wreck is given.

I therefore present to the above-named Institution the copyright and engraved steel-plates of these valued works of Art, to induce other proprietors of valuable pictures to follow my example, by which I am inclined to hope substantial means of affording relief to distressed artists may be forthcoming, and at the same time an encouragement given to artists to produce works of sufficient importance to secure their being handed down to posterity; and, let me observe, that whilst the proprietors of such pictures may be supplying themselves with another work of Art in the shape of an engraving, those prized pictures may at the same time encourage a charity in every way deserving of support.

I must ask you to be so good as to frame, with the assistance of the council, the most desirable mode of securing to the Institution the largest amount of money, which the possession of these plates may enable them to add to its funds.

You will, perhaps, allow me to observe, when I consider the circumstance of the late Mr. Turner having been a zealous and anxious supporter of your Institution, the possession of these plates by it is rendered very appropriate.

Believe me,
Dear Sir Charles Eastlake,
Yours faithfully,
YARBOROUGH.

MINOR TOPICS OF THE MONTH.

THE MODELS FOR SIX NEW STATUES to illustrate the creations of the poets of Great Britain, have been selected by the London City authorities, and the six commissions finally given. Mr. Baily undertakes another Miltonic figure, "The Spirit of the Woods;" Mr. Wyon a statue of "Britomart," from Spenser's "Faery Queen;" Mr. Theed, a figure of Gray's "Bard;" Mr. Durham, a statue of Hermione, in the "Winter's Tale;" Mr. Weekes, a figure of Sardanapalus, from Byron's tragedy; and Mr. Foley, a statue of Caractacus. These works are to be executed in marble; and for each the City is to pay the sum of 700*l*. The height of each is to be six feet. We have repeatedly expressed the exceeding satisfaction the public will feel at this encouragement of Art, on the part of the magnates of "Great London." We are not quite sure that wisdom has been exercised in permitting to the sculptors the choice of subject: they are, as will be seen, so varied in style and character, that all harmony is sacrificed. This may not be a disadvantage if they are to be placed in separate and distinct apartments; but it will be a serious evil if they are all to occupy the Egyptian Hall.

THE NATIONAL GALLERY.—Mr. Coningham, we fear, will never rest satisfied with any acquisition the National Gallery receives till he is consulted previously to its purchase: it is a great pity the trustees do not remove Sir Charles Eastlake, and substitute Mr. Coningham in his room; they will then, probably, be permitted to hold office in quietude. This gentleman has recently addressed a letter to the *Times*, asserting that the new purchase, "The Adoration of the Magi," by Paul Veronese, is absolutely worth nothing! We dare say if it fell into the hands of one of the itinerant picture-dealers who traverse the country, something would be made of it; at least, a few years ago this would have certainly been done. We are not prepared to say the picture is worth 2000*l*., about the sum which, it is stated, was paid for it; but surely the President of the Royal Academy, who is also Director of the National Gallery, and Mr. Wornum, the Secretary, who also, we presume, had a voice in the purchase, are as capable of forming an opinion on the originality and the value of a picture by an old master as Mr. Coningham: for ourselves, we have far less confidence in his judgment, even were he of less querulous disposition, than in that of the Director and the Secretary.

COPYRIGHT IN PICTURES.—The Royal Academy, it would seem, is about to stir itself in the long-vexed question of Copyright in Pictures, a meeting of the Council having been held on the evening of March 14th, to consider the best method of procedure. Such a movement it is right should emanate from such a body, and if properly managed, as there is every reason to believe it will be, must result in a manner satisfactory to the artists and the public. At present neither the one nor the other know what are their rightful claims.

COVENT GARDEN THEATRE.—The destruction by fire of this fine edifice on the morning of the 4th of March must be a matter of sincere regret to every lover of dramatic and lyric art, and scarcely less to the admirers of what more strictly belongs to the Fine Arts. In the almost universal conflagration, the magnificent scenery painted by Messrs. Grieve & Telbin during a course of many years for the various operas, pantomimes, and dramatic representations which were performed within its walls, is involved: of this description of Art-work it is not too much to say that they have never been surpassed in this or any other country, the talents of these artists having brought scene-painting to the highest point of excellence. The four pictures by Hogarth, representing the "Seasons," which hung upon the walls in the private room of the lessee, are also destroyed, besides an immense quantity of fine ancient armour, costumes of infinite variety, and "properties" of every kind, all of which served to make up the living pictures that have proved sources of rational enjoyment to thousands. But the ruins make a pic-

torial "subject" which would be worth looking at by some of our architectural painters; standing among them, one may, without any vast stretch of imagination, fancy himself among the relics of some old Roman edifice. The building itself was not without considerable attractions as an architectural work: it was erected, in 1809, from the design of Sir Robert Smirke, R.A., and the portico, which formed the principal feature externally, was always greatly admired; the sculptured bas-reliefs, and the statues of "Tragedy" and "Comedy" which also decorated the front, were executed by Flaxman. The theatre had frequently been used for purposes unworthy of its original object, and of the names—the Siddons and the Kembles—so long associated with its glories; and we cannot help lamenting it has fallen a victim to one of the most senseless and demoralising exhibitions that was ever contrived to pass away hours devoted to relaxation: we have often wondered that a sober-minded people, like the English, could tolerate the absurdities—to add nothing more—of a *bal masqué*.

THE ROYAL INSTITUTE OF ARCHITECTS.—The *Builder* announces that at a special general meeting of the Institute, held on Monday evening, February 18th, the Royal Gold Medal was unanimously awarded, subject to her Majesty's gracious approval, to Wm. Tite, Fellow, F.R.S., M.P. The Soane Medallion was awarded to Mr. Leonard R. Roberts, of Sackville Street, Piccadilly, for his design for a town mansion. A Medal of Merit was awarded to Mr. Thomas C. Sorby, of Guildford Street, Russell Square, for his design for Law Courts. A Medal of Merit to Mr. James Blake, of Handsworth, Birmingham, for his design for a town mansion. And the Silver Medal of the Institute to Mr. T. A. Britton, of Camden Town, for an essay on "The Timber-Growing Countries of Europe and America."

THE PROPOSED NEW NATIONAL GALLERY.—There seems to be some movement afoot relative to a new National Gallery, for Prince Albert, attended by Sir W. Cubitt and Mr. Edgar Bowring, recently paid a visit to the ground at Kensington Gore, purchased some time since by the Royal Commission: we shall wait anxiously to know what is contemplated.

TURNER'S BEQUEST: TRIMMER v. DANBY.—This case, which has been adjourned from time to time, to settle the terms of compromise between the Crown and the next of kin and heir-at-law of the testator, has at last been brought to a termination by the sanction of the Vice-Chancellor. The result, so far as the public is concerned, is that all pictures, finished and unfinished, sketches and drawings (except engravings), are to go to the Trustees of the National Gallery—that is, all works by the hand of Mr. Turner, the selection to be committed to Sir C. L. Eastlake, President of the Academy, and Mr. Knight, R.A., the Secretary. The engravings and other drawings (we do not quite understand what these "other drawings" can be) to be delivered to the next of kin: the trustees of the Royal Academy to be entitled to 20,000*l*., free of legacy duty. There thus seems to be no chance of the "Artists' Almshouse."

MADemoiselle ROSA BONHEUR's fine picture of "The Horse Fair," engraving for Mr. Gamhart, is at present being exhibited at the Royal Institution, Manchester, under the care of Messrs. Agnew & Son. Mr. Thomas Landseer is working most assiduously on the plate, which he hopes to have completed by the end of the year; it is of large dimensions. We have had an opportunity of examining an etching proof; it is, certainly, the work of a master; Mr. Landseer has caught the true spirit of the artist in the drawing and character of the animals, and if the plate is finished as it has been commenced, of which there is no doubt, it will, we expect, be the *chef d'œuvre* of the engraver.

GREENWICH HOSPITAL.—A stained glass window of large dimensions, about twenty-five feet in height, has recently been placed in the eastern end of the Painted Hall of Greenwich Hospital. It was executed from the designs, and under the superintendence, of Mr. Burchett, headmaster of the School of the Department of Science and Art, at Marlborough House. The principal decorations consist of our national

armorial bearings, surrounded by naval emblems and other ornaments: the whole has a rich effect, adding materially to the beauty of this noble apartment.

PICTURES AT THE CRYSTAL PALACE.—It is announced that a collection of paintings will be exhibited at the Crystal Palace during the summer, such pictures to be gathered not only from England, but from the various countries of the continent. Such a scheme might possibly have succeeded a year or two ago, but it cannot be concealed that the palace at Sydenham has lost its *prestige*, and it is not likely that artists of rank and merit will be disposed to place their pictures there—even if they have them to place, which is improbable. The project is to exhibit them "for sale," and this may tempt dealers to consider the Crystal Palace a convenient store-house; further than this we do not expect it to be; but while we view the affair with doubt approaching suspicion, it will be our duty to aid if we find the performance better than the promise.

THE PEACE CONFERENCES.—Mr. Gambart, the publisher, of Berners Street, has, it is said, given a commission to M. Dubufe, to paint a picture of the plenipotentiaries assembled in Paris to settle the question of peace: how the artist is to make his sketch "from the life" we know not, if the apartment in which the conferences are held is so hermetically sealed up against spectators and hearers as it is reported to be. M. Duhufe is a pupil of Paul Delaroché, and is to have 1200*l*. for his picture, which will be brought to England to be engraved.

THE OLD CRYPT under the Guildhall of London is, we hear, about to be converted into a kitchen! where turtle and venison will be dished up for future civic entertainments: Mr. Bunning has been requested to procure estimates for the necessary cooking apparatus. Is there so little reverence for antiquities among the civic authorities that this crypt, one of the finest specimens of early English architecture that the city can boast, must be sacrificed at the shrines of Mrs. Glass, Mrs. Dalgairns, and M. Soyer?

THE HAMPSHIRE CONVERSATION held a meeting on the 11th of March; the members and their friends assembling in considerable force. The principal Art-contributions were a large number of landscape sketches in oil, by Mr. J. W. Oakes, and in water-colour by Mr. W. L. Leitch; of churches by Mr. H. J. Johnson; Mr. E. Armitage's original sketches of the "Battle of Inkermann," and the "Charge at Balaklava," for the two large pictures now exhibiting in Pall Mall; sketches in the Crimea, by Mr. M. Halliday, an amateur artist; Mr. Cockerell, R.A., sent his ingenious and clever drawing of the "Professor's Dream," a comparative view of all the great buildings of the world; and his son, Mr. F. P. Cockerell, contributed several architectural drawings, chiefly of churches in Paris, Rome, &c. Other objects were collected in the apartment to aid in the evening's amusement; china, majolica ware, and weapons of war taken in the Crimean campaign.

PANORAMA OF SEBASTOPOL.—From the time of the elder Barker to the present, the wars in which England has been engaged have formed many of the most interesting and popular exhibitions in the building so long devoted to panoramic representations in Leicester Square; this is not to be wondered at if we recollect how wide an interest is created by the stern realities of war, even though we know them only through the aid of the artist's pencil. Mr. Burford, the worthy successor of the younger Barker, has recently opened to the public a "View of the City of Sebastopol, the Assaults on the Malakhoff and the Redan, the Retreat of the Russians to the North Side of the Harbour," &c., the whole constituting a most perfect and truthful representation of the final terrible struggle for this stronghold of Russian power in the Crimea. The panorama is painted from sketches taken by Captain Verschoyle, of the Grenadier Guards, aided by photographic views, which give to the work a truthfulness it would have been quite impossible to reach by any other means. The whole scene lies stretched out before the eye of the spectator—who is presumed to be standing on one of the outworks of the Malakhoff—in all its terrible vividness: we see the brilliant and

successful attacks of the French on this almost impregnable position, our own not less gallant but unfortunate attempt to storm the Redan, the long lines of trenches intersecting the surrounding country like a net-work, the town of Sebastopol riven and shattered by the long-continued and heavy fire of the besiegers, the suburb of the Karabelnaia, a perfect scene of ruin and desolation—everything, in fact, not only painted with the skill of a true artist, but, as was remarked by a visitor who had been present throughout the whole campaign, with “marvellous fidelity.” We trust the day is very far distant when such another subject—one in its vastness, its terrific and awful grandeur, can scarcely, however, occur again—will engage the pencil of Mr. Burford and his able assistant, Mr. Selous. We scarcely need to recommend a visit to it, but we can heartily do so. By the way, would it not be possible to open the exhibition in the evening? There are thousands who would gladly avail themselves of such an opportunity, whose occupations afford them no other; we throw out the hint for Mr. Burford's consideration.

STUMPS FOR CRAYON DRAWING.—We have received from Messrs. Houghton & Co. specimens of stumps applicable to crayon drawings of every kind; they seem to possess qualities as good as the stumps which are supplied to this country by manufacturers of France, who have hitherto enjoyed almost a monopoly in England of this useful article. The leather stump of Messrs. Houghton is very solid, and shows none of the interstices which so much annoy artists by producing double lines in ridges, and it possesses that great desideratum, a firm and solid point. The paper stump manufactured by them is made of the best white blotting-paper, which, by the aid of machinery, is rolled into a solid and correct form, pleasant to work with. The pulpy nature of the material gives to it a beautiful softness of surface unattainable by the hard paper in general use. There is also a stump which the makers call the “Cartoon Stump;” it will be found very useful from the peculiarity of its shape; the flat end being adapted for rubbing in foregrounds, and for model-drawing. These stumps may be procured from any of the principal artists' colourmen in London.

EVANS'S HOTEL.—Artistic improvements in our places of public resort are of so uncommon a kind, that we feel bound to devote a few words to a supper-room recently constructed at the back of Evans's Hotel, Covent Garden, and which may be considered one of the most elegant rooms in London; its proportions are magnificent, and its style of decoration sufficiently classic, without that sombre look it too frequently assumes. Its architect is Mr. Finch Hill, and he has judiciously availed himself of hidden lights above the architrave to give lightness to his ceiling; while it aids the uses to which the room is devoted. A very few years ago it would have been impossible to have alluded to this improvement at all; but to the present proprietor, Mr. Green, is due the honour of having elevated the moral tone of its amusements, and made them unobjectionable. This is no small honour, where profit was gained by the reverse nightly; and it required some moral courage to abandon the course altogether, as well as courage of another kind to hazard so much in the construction of this really beautiful room. It is a wholesome proof, however, of improved public taste, to find increased patronage rewarding both.

THE PORTRAIT OF THE DUKE OF RUTLAND, painted by Mr. F. Grant, R.A., has just been presented to his Grace, by a deputation of his tenants, at whose cost it was executed. The Duke is represented in a sitting position; the likeness is pronounced excellent.

THE BRITISH MUSEUM.—Mr. Panizzi has been appointed Principal Librarian to the British Museum, in the place of Sir Henry Ellis, who has recently resigned the post, after occupying it for more than half a century.

THE GRAPHIC SOCIETY had another meeting on the 12th of last month: what was to be seen on the occasion we know only from hearsay, and do not choose to report on second-hand authority.

REVIEWS.

THE FIRST-BORN. Engraved by T. VERNON, from the picture by C. W. COPE, R.A. **THE VILLA FOUNTAIN.** Engraved by W. FORREST, from the picture by W. L. LEITCH. Published by the Art-Union of Glasgow.

These two charming prints are intended for the subscribers, of the present year, to the Art-Union of Glasgow, and a more acceptable presentation they could scarcely desire to receive. In lieu of giving an engraving of very large dimensions, such as the “Return from Deer Stalking,” and “Coming of Age,” of former years, the committee have this year determined upon issuing two of a smaller size, yet of sufficient importance to hang on a wall: in this we think they have acted most judiciously, as in many instances the cost of framing large prints is a matter of consideration, and where it is not it is always convenient and agreeable to have variety, both of size and subject. But, we believe the principal reason of this departure from the usual course is, to avoid any unnecessary delay in the delivery of the prints—a delay that the working of a large plate would unavoidably have entailed. Mr. Cope's picture is one of his works exhibited at the Royal Academy within the last two or three years; it represents a young wife and her husband, most picturesquely grouped and attired, bending over the couch of their “first-born,” who lies sleeping, and in a state of half-nudity, its round fleshy limbs giving strong evidence of health and vigour: the boy will make a stalwart man if his life is preserved, and a handsome one, too. This, the lower part of the picture, as Mr. Vernon has translated it, deserves especial commendation: the whole is very good, but there is a delicacy and softness in the flesh of the child, and in the coverlid of the couch, we have rarely or never seen excelled; the lines show a masterly power of cutting, united with great tenderness. Mr. Vernon, whose engravings must be well known to our readers, will certainly add greatly to his reputation by this work. The upper half of the composition, which takes in the parents and the heavy foldings of a curtain, contrasts somewhat unfavourably with the lightness and elegance of the lower part; it is almost entirely in shadow, the weight of which well-nigh overpowers the rest; we think this might have been obviated by throwing a little more reflected light on the face of the mother, and on the right arm and shoulder of the male figure; although the light in the picture falls the other way, such a liberty, with the artist's treatment, might have been taken without injury to his composition, while it would certainly have much improved the engraving, by leading the eye gradually from the highest lights to the deepest shadows, and preserving a more equitable balance between the two. Yet as the work now stands it is a print to be coveted.

The “Villa Fountain” is from a very beautiful landscape composition by Mr. Leitch, whose imaginary Italian scenes are most poetically conceived and artistically painted: this picture shows pre-eminently his skill in designing and arranging Roman architecture in the midst of the most delicious landscape. We have in the picture before us, temple and palace, gateway, and bridges on lofty arches, not quite as they might be supposed to have been left by the original builders, but more or less spoiled by the hand of time; shrubs partially hide, and noble trees overshadow, the beautiful remains of Roman grandeur. In the foreground is a terrace, on which are numerous female figures engaged in fetching water from the “fountain” flowing through a kind of gateway below: the middle distance is occupied by a pile of buildings leading from a bridge that spans a narrow stream, which is seen winding its way through a long tract of country interspersed with villas and half-ruined edifices. It is saying Mr. Leitch no higher compliment than he deserves, to say his picture forcibly reminds us of some of Turner's best compositions of similar materials. The engraver, Mr. Forrest, has ably done his part to make the print popular; he appears to have caught the painter's feeling throughout, and to have translated the work with great ability: there is a richness and a fulness in his style that tell most effectively, while at the same time he has not lost sight of the delicacy of handling which marks the highly-finished engraving. There is, however, one passage in the work to which we should have drawn his attention had we seen a proof before printing. The aqueduct in the middle distance, and the masses of trees immediately below should have been a little lighter—as they now stand they come too forward, and give an appearance of heaviness to that portion of the engraving: the printer might have obviated this by careful “wiping out.”

WHAT IS PRE-RAPHAELITISM? By JOHN BALLANTYNE, A.R.S.A. Published by W. BLACKWOOD & SONS, Edinburgh and London.

After reading this pamphlet through very attentively, we do not seem to have arrived at any satisfactory solution of the question indicated in the title: Mr. Ballantyne writes sensibly upon certain characteristics of Art, but he has not answered his own query; we object only to the title given to his work, for he rather explains what Pre-Raphaelitism is not, than what it is. Assuming Mr. Ruskin's definition to be correct, that it is “the close study and imitation of nature,” Mr. Ballantyne would class Wilkie, Mulready, and others with the Pre-Raphaelites, except for the absence of those peculiarities in which the latter indulge; and he is perfectly right in doing so. There is no doubt that the painters anterior to Raphael studied nature closely, but their ignorance of the other essentials of a true and graceful representation of what is natural, renders their pictures the very reverse of agreeable, and far more of what is beautiful: they wanted, in fact, the science of Art to aid them to interpret aright what nature revealed to them. We may well doubt whether Cimabue, Giotto, Masaccio, Francia, Perugino, and other predecessors of Raphael would have painted as they did, if they had been born after the great master instead of before him; they would have been the first to recognise and imitate his truth, elegance, and beauty. Mr. Ballantyne has a thrust, a very gentle one, however, at Mr. Ruskin, for his advocacy of the claims of their modern followers, who, we are glad to find, are fast turning from the errors of their ways into a more rational and living style. Mr. Ballantyne's pamphlet is worth perusal, as a dissertation upon true and false styles.

THE LANGUAGE OF THE EYE: THE IMPORTANCE AND DIGNITY OF THE EYE AS INDICATIVE OF GENERAL CHARACTER, FEMALE BEAUTY, AND MANLY GENIUS. By JOSEPH TURNLEY. With Illustrations by GILBERT, ANELAY, &c. Published by PARTRIDGE & Co., London.

We have always regarded the loss of sight the greatest calamity that can befall an individual, next to the loss of reason; not only because the deprivation of this sense shuts out from him the enjoyment of all that is beautiful to the eye, and to the mind through that organ, but because he himself appears to all the world as one whose lamp of intelligence is extinguished, and he walks among his fellows a man on whom a very heavy portion of the primeval curse has fallen, in that he has lost the light of life. How often, when regarding such an object, have we desired the godlike power—

“From the thick film to purge the visual ray,
And on the sightless eyeball pour the day.”

True is it that the loss of sight has mercifully been supplied, in some degree, by extraordinary acuteness of perception in the use of other faculties; and the face of the blind is often expressive of the highest mental qualities belonging to our nature; yet, in every such case, there is still wanting that radiance which is necessary to illumine outwardly the understanding, just as we require the beams of the sun to light up, in all their beauty and infinite variety, the tints and colours of the landscape and the flower.

The language of the eye! what poet has not sung, who among all living creatures has not felt, its power, and its eloquence—more stirring than any words uttered by the lips of man? The eye, says Mr. Turnley, speaking of it as the inlet of thought to the brain, “is, of all the senses, the most reflective and powerful: by its rapid agencies man principally acts and thinks; and through its channels pass influences more numerous than the sands of the sea-shore,—influences which are as sparks of eternal light amidst kindred glories. By the aid of this acute sense, man is enabled to act amidst the social throng with order and excellence; through its agencies, his imagination is captivated, his affections secured, and an irresistible and seductive influence consummated over his will, his judgment, and every attribute of his nature.” And while the eye acts so as to assist materially in forming the character of the man, it is also a medium of developing that character to his associates, as well as the feelings by which he is at all times influenced: love, anger, joy, grief, pity, contempt, all the good and all the evil passions of his heart, shine through that mysterious organ, and proclaim what is passing within him as clearly as if the words were written on his forehead with a pen of fire.

Mr. Turnley is happy in the subject he has selected for a book, and he has treated it happily, handling it scientifically and philosophically, as

well as poetically. He has divided it into chapters, the first half of which speaks of the subject generally, the last half of particular characteristics—Genius, Hope, Innocence, &c. &c. His style of writing is good, except where now and then it becomes a little inflated—an offence that one may readily pardon, considering the topics to which his subject necessarily leads him at times. We have read his volume with much pleasure, but wish the whole of the illustrations, from the frontispiece to the last, were away: the former evidences bad taste in a living author, the rest are neither ornamental to the book, nor aids to the understanding of its contents.

CHOICE FRUIT, after the Picture by G. LANCE: PARIS FROM THE PONT ROYAL, after the Picture by T. S. BOYS. Printed in colours, and published by M. & N. HANHART, London.

A noble melon, grapes of prodigious size and quality, as it would seem, bunches of red currants, plums, &c., a bit of matting—Mr. Lance's matting is imperishable, it never wears out—are the materials of this chromo-lithographic picture: it is a large print, all the fruit being of its natural size, and it comes as near to the original as, we think, any colour-printing of such a subject can approach: the tints are rich and glowing, and the painter's touches are well copied; but we miss the transparency Mr. Lance gives to his fruit; this, in the grapes and currants, is especially lacking, nor do we think the art of Mr. Hanhart, or any other printer, can produce it; and, therefore, pictures of this nature are not so well adapted to exhibit the merits of chromo-lithography as are landscapes and figures.

The view of Paris is almost all that can be desired. The picture has evidently been painted in a low tone, but it is very life-like: we object, however, to the strong shadow thrown over the terminating end of the Louvre; it is far too heavy, and looks a blot on the print. In nature, a shadow so cast could only be accidental, and, therefore, would not be so intense, particularly at such a distance from the point of sight: had it fallen from any object in close proximity to the building, it would still be too dark: we presume the fault here rests with the painter rather than the copyist.

PHOTOGRAPHS TAKEN, UNDER THE PATRONAGE OF HER MAJESTY, BY ROGER FENTON, ESQ. Published by AGNEW & SONS, Manchester.

The large number of photographic pictures taken by Mr. Fenton in the Crimea last year, formed for some months one of the most attractive exhibitions in the metropolis; these photographs were taken expressly for publication, and the first part has now appeared, containing two subjects from each of the several divisions, portraits, incidents, and landscapes. A work of this character is almost beyond the criticism of the reviewer; he has not to comment upon the art of the painter nor the skill of the engraver; nature, aided by the scientific talents of the photographer, does the work of both, and in this case the work has been done well. It seems almost unnecessary to recommend a publication to which so universal an interest is attached, for there is little doubt of its finding the patronage to which it is entitled, both as regards the nature of the subject and the beauty of the sun-pictures.

THE DISTURBER DETECTED. Engraved by W. T. DAVEY, from the Picture by G. CRUIKSHANK. Published by T. MACLEAN, London.

From Mr. Cruikshank's pencil we always expect to see something diverting, or some lesson of sound morality, and we are rarely disappointed. The "Disturber Detected" is of the former class, and, if we are not mistaken, is the first engraving from any oil-picture by this artist. The scene is the interior of a country church: seated in the front of the squire's pew is the beadle—of the veritable Bumble species—at whose right hand is a group of village children, one of whom, an ill-favoured looking boy in a round frock, has let fall on the stone flooring a peg-top, to the disturbance of the whole congregation: the beadle is horrified, the squire casts a side-glance over the corner of his pew at the offender, the squire's family are all on the *qui vive*, the quiet pew-opener, whose head appears above the back of the pew, is shocked; the culprit is looking at the beadle as if anticipating the application of his official stick, while the companions of the boy regard him with various expressions, according to the ideas they entertain of the flagrancy or fun of the disturbance. There is one lad quite a study; a "good" boy, whose eyes are

fixed on the preacher, and who would have him believe that he never brought a top to church in his life. The engraving makes little pretensions to a work of Art, strictly so called, but it has in it an abundance of amusing character, and, as a cheap print, will find many desirous of possessing it.

THE ART OF PAINTING AND DRAWING IN COLOURED CRAYONS. By HENRY MURRAY. Published by WINSOR & NEWTON, London.

Messrs. Winsor & Newton have published a number of Handbooks, including almost every subject that comes within the domain of the Fine Arts, but the series would not be completed had they omitted to furnish a guide to the art of crayon painting, or pastel-painting, as it is now more generally called. This very pleasing method of producing pictures has been brought to great perfection by Mr. Bright, the landscape-painter; in figures, however, it has been but little practised in this country, though to a considerable extent in France. Mr. Murray's little treatise explains the best method of working the crayons, and preparing the various materials necessary for practising the art; the directions are concise but intelligible, and, we should think, amply sufficient for the purpose of the learner. An art so comparatively easy of execution, and producing such pleasing results in the hands of a moderate proficient, ought to find many desirous of practising it; to such we would strongly recommend Mr. Murray's little book.

THE ART OF FLOWER-PAINTING. By MRS. WILLIAM DUFFIELD. With Twelve Illustrations on Wood, engraved by DALZIEL. Published by WINSOR & NEWTON.

Another of Messrs. Winsor & Newton's Handbooks. Mrs. Duffield takes rank among our most accomplished flower-painters, and therefore may be regarded as an authority when she inculcates precepts having reference to an art which she practises so successfully. Her book professes to be nothing more than an elementary treatise in which instructions are submitted to the learner for painting a few flowers singly, with some general remarks as to grouping. So far as teaching without the aid of a master can be made effectual, the remarks of Mrs. Duffield will answer their proposed end.

PHOTOGRAPHIC VIEWS OF SEBASTOPOL, TAKEN IMMEDIATELY AFTER THE RETREAT OF THE RUSSIANS, SEPT. 8, 1855. By G. SHAW LEFEVRE. Published by J. HOGARTH, London.

Mr. Shaw Lefevre is an amateur photographer, who paid a visit to the Crimea in the autumn of last year, and has now published, at his own expense, a series of twelve photographic views; the profits arising from the sale of the work he purposes most appropriately to devote to the "Nightingale Fund." The series of pictures includes many of the most interesting points in Sebastopol and its immediate vicinity:—"The Glacis of the Redan from the Curtain of the Malakoff," "View of the Redan, looking towards the Great Ravine," "Carronade Battery—Sappers looking for Electric Wires," "View of the Russian Batteries behind the Redan," "The General's Bunk in the Redan," "Street in the Karabelnia," "Interior of the White Tower in the Malakoff," "The 'Leander' at the entrance of Balaklava Harbour," &c. &c. The whole of these views are given with much clearness, and must afford a very faithful idea of the devastation and the bustle entailed by war. The name of the artist is deservedly honoured—near and far; and the younger branch of a renowned family upholds its high repute: there is something peculiarly gratifying in his thus giving to the world the results of his adventurous travel: and dedicating the fruits to the most interesting and important purpose that modern times have developed for the benefit of the age.

"I'M A-THINKING." Engraved by F. BACON from a Drawing by F. W. TOPHAM. Published by ACKERMANN & Co., London.

The subject of this pretty little print is, we should "think," a study from nature: a child, with a remarkably intelligent and pleasing face, has let the book she is reading drop on her lap, and, with her finger to her lip, seems meditating on something she has found in the volume she cannot quite understand. It is just one of those subjects which will enforce popularity from its simplicity, truth, and agreeable expression. The engraving, in a mixed style of line and mezzotint, is carefully executed by Mr. Bacon.

MISCELLANEA GRAPHICA: A COLLECTION OF ANCIENT MEDIEVAL AND RENAISSANCE REMAINS, IN THE POSSESSION OF THE LORD LONDENBOROUGH. Illustrated by F. W. FAIRHOLT, F.S.A. Part VIII. Published by CHAPMAN & HALL, London.

This very beautiful—and, to certain classes of Art-manufacturers, very useful—work, continues to make its appearance at intervals consistent with the careful execution of the plates. The first sheet in Part VIII. contains coloured fac-similes of Merovingian brooches, all of them of gold, or silver-gilt, inlaid with precious stones, and, in one or two instances, enriched with filigree ornaments. The second plate contains an engraving, very highly finished, of the miraculous bell of St. Muran, which, according to the Irish legend, is said to have descended from heaven, ringing loudly; "but as it approached the concourse of persons who had assembled at the miraculous warning, the tongue detached itself, and returned towards the skies; hence it was concluded that the bell was never to be profaned by sounding on earth, but was to be kept for purposes more holy and beneficial. This is said to have happened on the spot where once stood the famous Abbey of Fohan, near Innishowen, County Donegal, founded in the seventh century by St. Muran, or Muranus, during the reign of Aodh Slaine." The bell was for several centuries in the Abbey, and was used as a depository of various objects, held in especial veneration by the people: it ultimately fell into the possession of a poor peasant, residing in Innishowen, who sold it to Mr. Brown, of Beaumaris, from whom it was purchased by Lord Londesborough, in 1855, for 80*l*. Its form is quadrangular, standing about six inches high. It is of bronze, ornamented with a tracery of Runic knots; over the surface plates of silver had been laid, at a subsequent period, as Mr. Fairholt thinks; these plates are embossed "in the style known to have prevailed in the eleventh century. The centre is adorned with a large crystal, and smaller gems have once been set in other vacant sockets round it; only one of amber now remains." The entire ornamentation of this antique relic is very similar to that which is found on the old Irish crosses.

The next plate contains five representations of ancient fire-locks, all of them richly chased and carved; one of these weapons, a "wheel-lock gun," was originally the property of Charles IX. of France; "it is traditionally reported to have been the gun he used in firing on his Huguenot subjects during the Massacre of St. Bartholomew." The last plate introduces some Roman bronzes, one of which, an archer, was found, by Mr. Chaffers, F.S.A., in Queen Street, Cheapside, in July, 1842, while some excavations were being carried on there. The Roman plough is a singular example of Art-manufacture, and the Lamp is very elegant; the latter bears the Christian monogram on its side.

ECCLESIASTES, OR THE PREACHER. By the Rev. A. A. MORGAN, M.A. Published by T. BOWWORTH, London.

We can best describe the nature of this handsomely "got up" volume, by quoting its lengthy title:—"The Book of Solomon, called Ecclesiastes, or the Preacher, metrically paraphrased, and accompanied with an Analysis of the Argument: being a Translation of the Original Hebrew, according to the Interpretation of the Rabbinic Commentary of Mendelssohn, the Criticisms of Preston, and other Annotators. The subject newly arranged, with analytical headings to the sections." As an illustrated book, embellished with large woodcuts from some charming drawings by Mr. George Thomas, it calls for our notice rather than as an attempt to verify the "sayings of the Wise Man." As we hope, however, to introduce specimens of these illustrations into a future number, we reserve what we have to say, both as to text and the engravings.

A DICTIONARY OF GREEK AND ROMAN GEOGRAPHY. Edited by WM. SMITH, LL.D. Part XIII. Published by WALTON & MABERLY, London.

Dr. Smith's unwearied labours for many years in the cause of classical science are too well known and too highly appreciated to need any enforcement here. The dictionaries he has already completed are among the few books produced in our own day of flimsy literature that take rank with those which have received the award of scholars in past time. Sound as authorities, and scrupulously laborious as compilations, embracing the fruits of the latest researches in scholarship, this new addition will be welcomed beside its fellows. It is intended to be completed this year; and will be an indispensable guide to the student of classical topography.

THE ART-JOURNAL.

LONDON, MAY 1, 1856.

THE
MINSTRELS OF THE MIDDLE AGES.

BY THE REV. EDWARD L. CUTTS, B.A.

It would be exceedingly interesting, but it would carry us too far a-field, to give a sketch of the early music of the principal nations of antiquity, such as might easily be deduced from the monuments of Egypt and Nineveh and Greece. We may, however, briefly glance at the most ancient minstrelsy of the Israelites; partly for the sake of the peculiar interest of the subject itself; partly because the early history of music is nearly the same in all nations, and this earliest history will illustrate and receive illustration from a comparison with the history of music in mediæval England.

Musical instruments, we are told by the highest of all authorities, were invented in the eighth generation of the world—that is in the third generation before the flood—by Tuhah “the Father of all such as handle the harp and organ.” The ancient Israelites used musical instruments on the same occasions as the mediæval Europeans; in battle; in their feasts and dances; in processions, whether of religious or civil ceremony; and in the solemnising of divine worship. The trumpet and the horn were, then as always, the instruments of warlike music—“If ye go to war then shall ye blow an alarm with the silver trumpets.”* The trumpet regulated the march of the hosts of Israel through the wilderness. When Joshua compassed Jericho, the seven priests blew trumpets of rams’ horns. Gideon and his three hundred discomfited the host of the Midianites with the sound of their trumpets.

The Tabret was the common accompaniment of the troops of female dancers, whether the occasion were religious or festive. Miriam the prophetess took a timbrel in her hand and all the women went out after her with timbrels and with dances, singing a solemn chorus to the triumphant song of Moses and of the Children of Israel over the destruction of Pharaoh in the Red Sea, —

“Sing ye to the Lord, for he hath triumphed gloriously:
The horse and his rider hath he thrown into the sea.” †

Jephthah’s daughter went to meet her victorious father with timbrels and with dances :—

“The daughter of the warrior Gileadite,
From Mizpeh’s tower’d gate with welcome light,
With timbrel and with song.”

And so, when King Saul returned from the slaughter of the Philistines, after the shepherd David had killed their giant champion in the valley of Elah; the women came out of all the cities to meet the returning warriors “singing and dancing to meet King Saul, with tabrets, with joy and with instruments of music;” and

the women answered one another in dramatic chorus—

“Saul hath slain his thousands:
And David his ten thousands.” *

Laban says that he would have sent away Jacob and his wives and children “with mirth and with songs, with tabret and with harp.” And Jeremiah prophesying that times of ease and prosperity shall come again for Israel, says: “O Virgin of Israel, thou shalt again be adorned with thy tabrets, and shalt go forth in the dances of them that make merry.” †

In their feasts these and many other instruments were used. Isaiah tells us ‡ that they had “the tabret and pipe and wine,” and again § “the harp, and viol, and wine in their feasts;” and Amos tells us of the luxurious people who lie upon beds of ivory, and “chant to the sound of the viol, and invent to themselves instruments of music like David,” and drink wine in bowls, and anoint themselves with the costliest perfumes.

Instruments of music were used in the colleges of Prophets, which Samuel established in the land, to accompany and to inspire the delivery of their prophetic utterances. As Saul, newly anointed, went up the hill of God towards the city, he met a company of prophets coming down, with a psaltery, and a tabret, and a pipe, and a harp before them, prophesying; and the spirit of the Lord came upon Saul when he heard, and he also prophesied. || When Elisha was requested by Jehoram to prophesy the fate of the battle with the Moabites, he said: “Bring me a minstrel; and when the minstrel played, the hand of the Lord came upon him, and he prophesied.”

When David brought up the ark from Gibeah, he and all the house of Israel played before the Lord on all manner of instruments made of fir-wood, even on harps, psalteries, timbrels, cornets and cymbals. ¶ And in the song which he himself composed to be sung on that occasion,** he thus describes the musical part of the procession :—

“It is well seen how thou goest,
How thou, my God and King, goest to the sanctuary;
The singers go before, the minstrels follow after,
In the midst are the damsels playing with the timbrels.”

The instruments appointed for the regular daily service of the Temple “by David, and Gad the king’s seer, and Nathan the prophet, for so was the commandment of the Lord by his prophets,” were cymbals, psalteries, and harps, which David made for the purpose, and which were played by four thousand Levites.

Besides the instruments already mentioned, —the harp, tabret, timbrel, psaltery, trumpet, cornet, cymbal, pipe, and viol,—they had also the lyre, bag-pipes, and bells; and probably they carried back with them from Babylon further additions, from the instruments of all peoples, nations and languages with which they would become familiarised in that capital of the world. But from the time of Tuhah down to the time when the royal minstrel of Israel sang those glorious songs which are still the daily solace of thousands of mankind; and further down to the time when the captive Israelites hanged their unstrung harps upon the willows of Babylon, and could not sing the songs of Zion in a strange land,—the harp continued still the fitting accompaniment of the voice in all poetical utterance of a dignified and solemn character: the recitation of the poetical portions of historical and prophetic Scripture, for instance, would be sustained by it, and the songs of the psalmists of Zion were accompanied by its strains. And thus this sketch of the history of the earliest music closes, with the minstrel harp still in the foreground; while in the distance we hear the faint sound of the fanfare of cornet, flute, harp, sackbut, psaltery, dulcimer, and all kinds of music, which were concerted on great occasions; such as that on which they resounded

over the plain of Dura, to bow that waving sea of heads to the great Image of Gold:—an idolatry, alas! which the peoples, nations, and languages still perform almost as fervently as of old.

The northern Bard, or Scald, was the father of the minstrels of mediæval Europe. Our own early traditions afford some picturesque anecdotes, proving the high estimation in which the character was held by the Saxons and their kindred Danes; and showing that they were accustomed to wander about to court, and camp, and hall, and were hospitably received, even though the Bard were of a race against which his hosts were at that very time encamped in hostile array. We will only remind the reader of the Royal Alfred’s assumption of the character of a minstrel, and his visit in that disguise to the Danish camp (A.D. 878); and of the similar visit, ten years after, of Anlaf the Danish king, to the camp of Saxon Athelstane. But the earliest anecdote of the series we shall have hereafter to refer to, and may therefore here detail at length. It is told us by Geoffrey of Monmouth, that Colgrin, the son of Ella, who succeeded Hengist in the leadership of the invading Saxons, was shut up in York, and closely besieged by King Arthur and his Britons. Baldulph, the brother of Colgrin, wanted to gain access to him, to apprise him of a reinforcement which was coming from Germany. In order to accomplish this design, he assumed the character of a minstrel. He shaved his head and beard; and, dressing himself in the habit of that profession, took his harp in his hand. In this disguise he walked up and down the trenches without suspicion, playing all the while upon his instrument as a harper. By little and little he approached the walls of the city; and, making himself known to the sentinels, was in the night drawn up by a rope.

In Saxon times, before the date of the Norman Conquest, we find the various features of minstrelsy as they continued through the middle ages, already established. In the illustration

which we here give from a late Saxon MS. in the British Museum, (Cotton, Tiberius, C. vi.) the royal harper is surrounded by a band of minstrels, while the mime of the band is playing the common feat of tossing three knives and three balls.

The harper always continued throughout the middle ages to be the most dignified of the minstrel craft, the reciter, and often the composer, of heroic legend and historical tale, of wild romance and amorous song. Frequently,

† Exod. xv. 21.

and perhaps especially in the case of the higher class of harpers, he travelled alone, as in the cases which we have already seen of Baldolph, and Alfred, and Aulaff. But he also often associated himself with a band of minstrels, who filled up the intervals of his recitations and songs with their music, much as vocal and instrumental pieces are alternated in our modern concerts. With a band of minstrels there was also very usually associated a mime, who amused the audience with his feats of agility and leger-de-main. The association appears at first sight somewhat undignified—the heroic harper and the tumbler—but the incongruity was not peculiar to the middle ages; the author of the “Iliad” wrote the “Battle of the Frogs,”—the Greeks were not satisfied without a satiric drama after their grand heroic tragedy; and in these days we have a farce or a pantomime after Shakespeare: we are not all Heraclituses, to see only the tragic side of life, or Democrituses, to laugh at everything; the majority of men have faculties to appreciate both classes of emotion, and it would seem, from universal experience, that, as the Russian finds a physical delight in leaping from a vapour-bath into the frozen Neva, so there is some mental delight in the sudden alternate excitation of the opposite emotions of tragedy and farce. If we had time to philosophise, we might find the source of the delight deeply seated in our nature: alternate tears and laughter—it is an epitome of human life.

The other Saxon instruments, besides those already mentioned, are the flute, cymbal, viol, tabor, hand bells, lyre struck by a plectrum, and the organ: the latter was already the favourite church instrument: William of Malmesbury says, that Archbishop Dunstan gave many to churches, which had pipes of brass, and were inflated with bellows.

We give here an illustration of the organ, of much later date indeed, for it is from a MS. in the British Museum of early fourteenth century date (Royal MS. 14 E iii.), but it gives a good idea of the large organ in use throughout the middle ages.

The Northmen who invaded and gave their name to Normandy, took their minstrels with them; and the learned assert that it was from them that the troubadours of Provence learned their art, which ripened in their sunny clime into *la joyeuse science*, and thence was carried into Italy, France, and Spain. It is quite certain that minstrelsy was in high repute among the Normans at the period of the Conquest. Everyone will remember how Taillefer the minstrel-knight commenced the great battle of Hastings. Advancing at the head of the Norman host, he animated himself and them to a chivalric daring by chanting the heroic tale of Charlemagne and his Paladins; and then rushed into the Saxon ranks, like a divinely-mad hero of old, giving in his own self-sacrifice an augury of victory to his people.

From the period of the Conquest, authorities on the subject of which we are treating, though still not so numerous as could be desired, be-

come too numerous to be all included within the limits to which our space restricts us. The reader may refer to Wharton's “History of English Poetry,” to Bishop Percy's introductory essay to the “Reliques of Early English Poetry,” and to the introductory essay to Ellis's “Early English Metrical Romances,” for the principal published authorities. We propose only from these and other published and unpublished materials, to give a popular sketch of the subject.

Throughout this period minstrelsy received the patronage, and was in high estimation with, all classes of society. The king himself, like his Saxon * predecessors, had a king's minstrel, or king of the minstrels, who probably from the first was at the head of a band of royal minstrels.†

This fashion of the Royal court, doubtless, like all its other fashions, obtained also in the courts of the great nobility (several instances will be observed in the sequel), and in their

fine representation of a similar scene occurs at the foot of the large Flemish brass of Robert Braunche and his two wives at St. Margaret's Church, Lynn; the scene is intended as a delineation of a feast given by the corporation of Lynn to King Edward III. Servants from both sides of the picture are bringing in that famous dish of chivalry, the peacock with his tail displayed; and two bands of minstrels are ushering in the banquet with their strains: the date of

measure in the households of the lesser nobility. Every gentleman of estate had probably his one, two, or more minstrels as a regular part of his household. It is not difficult to discover their duties. In the representations of dinners, which occur plentifully in the mediæval MSS., we constantly find musicians introduced; sometimes we see them preceding the servants, who are bearing the dishes to table; a custom of classic usage; and which still lingers at Christ Church, Oxon, in the song with which the choristers usher in the boar's head on Christmas-Day; and at our modern public dinners, when the band strikes up “Oh, the Roast Beef of Old England,” as that national dish is brought to table.

We give here an illustration of such a scene from a very fine MS. of the early part of the fourteenth century, in the British Museum (marked Royal 2 B vii., f. 184^b and 185). A very

the brass is about 1364 A.D. In the fourteenth century romance of Richard Cœur de Lion, we read of some knights who have arrived at the presence of the romance king whom they are in quest of; dinner is immediately prepared for them; “trestles,” says Ellis in his abstract of it, “were immediately set; a table covered with a silken cloth was laid; a rich repast, ushered in by the sound of trumpets and shalms, was served up.”*

Having introduced the feast, the minstrels

continued to play during its progress; we find

* The king's minstrel of the last Saxon king is mentioned in Domesday Book as holding lands in Gloucestershire.

† In the reign of Henry I., Roger was the King's Minstrel. Temp. Henry II., it was Galfred, or Jeffrey. Temp. Richard I., Blondel, of romantic memory. Temp. Henry III., Master Ricard. It was the Harper of Prince Edward (afterwards King Edward I.) who brained the assassin who attempted the Prince's life, when his noble wife Eleanor risked hers to extract the poison from the wound. In Edward I.'s reign we have mention of a King Robert, who may be the impetuous minstrel of the Prince. Temp. Edward II., there occur two: a grant of houses was made to William de Morley, the King's Minstrel, which had been held by his predecessor, John le Boteler. At St. Bride's, Glamorganshire, is the insculpt effigy of a knightly figure, of the date of Edward I., with an inscription to John le Boteler; but there is nothing to identify him with the king of the minstrels. Temp. Richard II., John Camuz was the king of his minstrels. When

Henry V. went to France, he took his fifteen minstrels, and Walter Haliday, their marshal, with him. After this time, the chief of the royal minstrels, seems to have been styled *Marshal* instead of King; and in the next reign but one we find a *Sergeant* of the Minstrels. Temp. Henry VI., Walter Haliday was still Marshal of the Minstrels; and this king issued a commission for impressing boys to supply vacancies in their number. King Edward IV. granted to the said long-lived Walter Haliday, Marshal, and to seven others, a charter for the restoration of a Fraternity or Guild, to be governed by a marshal and two wardens, to regulate the minstrels throughout the realm (except those of Chester). The minstrels of the royal-chapel establishment of this king were thirteen in number; some trumpets, some shalms, some small pipes, and others singers. The charter of Edward IV. was renewed by Henry VIII. in 1520, to John Gilman, his then marshal; on whose death Hugh Wodehouse was promoted to the office.

* Ellis's “Early English Metrical Romances,” Bohn's edition, p. 287.

numerous representations of dinners in the illuminations, in which one or two minstrels are standing beside the table, playing their instruments during the progress of the meal. In a MS. volume of romances of the early part of the fourteenth century in the British Museum (Royal 14 E iii.), the title-page of the romance of the "Quête du St. Graal" (at folio 89 of the MS.) is adorned with an illumination of a royal banquet; a squire on his knee (as in the illustration given above) is carving, and a minstrel stands beside the table playing the fiddle; he is dressed in a parti-coloured tunic of red and blue, and wears his hat. In the royal MS. 2 B vii., at folio 168, is a similar representation of a dinner,

in which a minstrel stands playing the fiddle; he is habited in a red tunic, and is bareheaded. At folio 203 of the same MS. (Royal 2 B vii.), is another representation of a dinner, in which two minstrels are introduced; one (wearing his hood) is playing a cittern, the other (bareheaded) is playing a fiddle; and these references might be multiplied.

We reproduce here, in illustration of our subject, two engravings which have already appeared in the *Art-Journal*, in illustration of Mr. Wright's "Domestic Manners of the English." The first is a representation of a royal dinner of about the time of our Edward IV., "taken from an illumination of the romance of the Compté d'Artois,

in the possession of M. Barrois, a distinguished and well-known collector in Paris.* The other is an exceedingly interesting representation of a grand imperial banquet, from one of the plates of Hans Burgmair, in the volume dedicated to the exploits of the Emperor Maximilian, contemporary with our Henry VIII. It represents the

entrance of a masque,* one of those strange entertainments, of which our ancestors, in the

Another occasion, on which their services would be required would be for the dance. Thus we read in the sequel of "The Squire's Tale," how the king and his "nobley," when dinner was ended, rose from table, and preceded by the minstrels, went to the great chamber for the dance:—

* *Art-Journal* for 1853, p. 246.

"Wan that this Tartar king, this Cambuscan,
Rose from his bord ther as he sat ful hie;
Beforne him goth the londé minstrelcie,
Til he come to his chambre of paraments,†
Ther as they sonnden divers instruments,
That it is like an Heven for to here.
Now dancen lusty Venns children dere," &c.

* *Art-Journal* for 1854, p. 275.

† Great chamber, answering to our modern drawing-room.

time of Henry and Elizabeth, were so fond, and of which Mr. C. Kean has lately given the play-going world of London so accurate a representation in his *mise en scene* of Henry VIII., at the Princess's Theatre. The band of minstrels who have been performing during the banquet, are seen in the left corner of the picture.

So in "The Squire's Tale" of Chaucer, where Cambuscan is "holding his feste so solempne and so riche."

"It so befel, that after the thridde coffers,
While that this king sit thus in his nobley,*
Harking his ministrallus her † stringes play,
Beforne him at his bord deliciously," &c.

The custom of having instrumental music as an accompaniment of dinner is still retained by her Majesty and by some of the greater nobility, by military messes, and at great public dinners. But the musical accompaniment of a mediæval dinner was not confined to instrumental performances. We frequently find a harper introduced, who is doubtless reciting some romance or history, or singing chansons of a lighter character. He is often represented as sitting upon the floor, as in the accompanying illustration, from the Royal MS., 2 B vii., folio 71 b. Another similar representation occurs at folio 203 b of the same MS. In the following very charming picture, from a MS. volume of romances of early fourteenth century date in the British Museum (Additional MS., 10,292, folio 200), the harper is sitting upon the table.

Gower, in his "Confessio Amantis," gives us a description of a scene of the kind. Appolinus is dining in the hall of King Pentapolin, with the king and queen and their fair daughter, and all his "lordes in estate." Appolinus was reminded by the scene of the royal estate from which he is fallen, and sorrowed and took no meat; therefore the king bade his daughter take her harp and do all that she can to enliven that "sorry man."

"And she to dou her fader's hest,
Her harpe fette, and in the feste
Upon a chaire which thei fette,
Her selve next to this man she sette."

Appolinus in turn takes the harp, and proves himself a wonderful proficient, and

"When he hath harped all his fille,
The kingis hest to fulfille,
A waie goth dishe, a waie goth cup,
Down goth the borde, the cloth was np,
Thei risen and gone out of the halle."

In the sequel, the interesting stranger was made tutor to the princess, and among other teachings,

"He taught hir till she was certeyne
Of harpe, citole, and of riote,
With many a towne and many a note,
Upon mnsike, upon mesure,
And of her harpe the tempurure
He taught her eke, as he well couth."

In the tale of Dido and Æneas, in the legend of "Good Women," he calls it especially the dancing chamber:—

"To dawning chambers full of paraments,
Of riche bedes † and of pavements,
This Æneas is ledde after the meat."

[To be continued.]

* Among his nobles. † Their. ‡ Couches.

PROGRESS OF
BRITISH ART-MANUFACTURE.
THE PORCELAIN OF WORCESTER.

MESSRS. KERR & BINNS—the present proprietors and conductors of the long-famous Porcelain Works at Worcester—have recently produced some examples of the Art, of which it is not too much to say, they surpass all the productions of their class that have been hitherto manufactured in this country. We allude chiefly to their attempts (in which they have eminently succeeded) to imitate the artistic character of the works of Limoges on a porcelain body; hitherto

they have taken as their models those in 'one colour, of Jean Courtois (1540) and in various colours those of Noel Laudin (1695).

In the works of Limoges, all the shades are laid in with dark colour on white; but it is the peculiarity of the Worcester enamels that the shades are produced by the reflection of the blue ground through the white. A very delicate tone is hence given to the pictured subject,

which is still more advantageously "set off" by the intense colour of the cobalt, which forms the ground. It will be understood that the whole of the material of this imitation enamel is porcelain; differing therefore from the ancient produce as well as the Sèvres imitations, in which the porcelain is laid over thin sheets of copper.

We believe this attempt is the first that has succeeded to obtain such effects by such means,

and we cannot doubt that large difficulties have been overcome by patient and careful study to obtain a peculiarly delicate glaze, a very sensitive medium, and especially accomplished workmen for the perfecting of the task.

Our attention was first directed to these singularly beautiful works at the Exhibition in

Paris, where we found them very much admired, but where certainly they were not considered to be composed entirely of porcelain body—on which so valuable an effect had been produced by the apparently simple process of layers of white on a deep blue ground, the shading being produced by the thinner or thicker gradations of

the white, through which the blue was suffered to make its way to the eye. The engravings here given convey but a limited idea of the beauty of these works; yet, the reader will hence be able to understand that the subjects have been selected with much judgment and taste, and we give him the assurance that the

execution of the pictures, so to speak, is of a rare degree of excellence, drawn with severe accuracy; for upon this particular quality the value of the article mainly depends.

The subjects speak for themselves. Our selections are confined to the EWER and STAND, a VASE, a PASTILE BURNER, a PLATE and a TAZZA; but, if we understand rightly, various other articles are

produced by these manufacturers in this style—some of a very elaborate character, and some of a less costly description.

The designs are, we believe, for the most part from the pencil of Mr. R. W. Binns and the painting is by Mr. T. Bott. Our engravings are copied from photographs, but we imagine we are correct in stating that, although several of our

specimens are in the one tint—the white upon blue—others are in colours. Our acquaintance with these works, when we carefully examined them at Paris, justifies the high praise we bestow upon them in describing them as foremost among the most successful efforts in porcelain that have been produced in Great Britain, or probably in any other country.

We rejoice at these results, not only as upholding and extending the character of British Art-manufacture, but as restoring the ancient renown of Worcester, which has, for a long period, lain comparatively dormant. The porcelain productions of that city, executed some forty years ago, are held in the highest repute, and are sought for by collectors with great avidity. Unlike the manufactory at "Chelsea"—of which almost as little is known as of that of Etruria, except by its "remains"—the establishment at Worcester has never been abandoned; its history may be traced back to its founder, and it is a great satisfaction to report its progress in 1855, as in no way behind that of the best periods of its existence during the century it has lived and flourished.

The Royal Porcelain Works of Worcester were founded by Dr. Wall, who, in conjunction with some other eminent chemists, made assiduous researches to discover materials proper for the imitation of China-ware, and, in 1751, established a manufactory under the title of the Worcester Porcelain Company. "Printing upon porcelain," is said to have originated with Dr. Wall. To him is "generally assigned the ingenious method of transferring printed patterns to biscuit ware, which is now universally practised." A guide-book to the Porcelain Works, Worcester, contains some prints from copper-plates, which are believed to be from the earliest plates used in printing on porcelain, and these are excellent examples of design and drawing. In 1783 the manufactory was purchased by Mr. Thomas Flight, by whom it was transferred to Messrs. Flight & Barr; under their judicious management, and by their employment of competent artists, it obtained a renown which it kept for a long period undisputed. In 1790, a manufactory at Worcester was formed by Messrs. Chamberlain. With this manufactory that of Messrs. Flight & Barr was subsequently incorporated, and in due course it passed into the hands of its present proprietors—Messrs. Kerr & Binns—Mr. Binns having been for a long time previously the director of the Falcon Glass Works, the well-known establishment of Messrs. Apsley Pellatt in London.

Judging from the works they have already produced—from those of the highest and most costly character down to articles for ordinary and daily use—we but discharge our duty in expressing a confident belief that this manufactory will be restored to the palmy state it occupied at the close of the past and beginning of the present century.

The Exhibition of 1851—as far as porcelain is concerned—did much to convince the world that England was not behind any country of Europe in ceramic art. Until that event, we obtained comparatively little credit for our home productions. When aught that was especially graceful and beautiful was seen in "shop windows," it was usually looked upon as foreign. There was no gainsaying the facts supplied by the stalls of Messrs. Minton, Mr. Alderman Copeland, Messrs. Rose, &c.; and this branch of British Art-manufacture unquestionably derived immense advantages from "the Exhibition." Its fame was entirely upheld at Paris in 1855: our manufacturers were surpassed by none—if we except the government establishment at Sèvres. The issues hence are, it is known, produced without regard to cost; and there can be no fair comparison between those of "the Empire" and the private fabricant, either of England, Germany, or France.

We rejoice to know that the impetus thus given to a manufacture, only second in importance to that of Manchester, has produced its natural results. Few more satisfactory or encouraging proofs of this can be laid before the public than these works of the manufactory at Worcester.

It may not be improper to add that it has always had a large share of "Royal Patronage" from the early time of George III. to the present auspicious reign: and that a very considerable portion of the more famous visitors to Europe from all parts of the world have inspected the Porcelain Manufactory at Worcester.

THE SOCIETY OF BRITISH ARTISTS.

THE THIRTY-THIRD EXHIBITION.

THIS exhibition was opened to the public on the 24th of March, with a catalogue of upwards of eight hundred works. Although there are no really ambitious pictures in the collection, there is an absence of those experimental essays wrought on vague principles which are always inglorious failures, or, at least, painful eccentricities. There are some figure studies not of exalted character, but highly meritorious, and there are landscapes of a high degree of excellence. When we stand in the middle of the great room, and glance round the line and above the line, we feel at once that the general quality of the collection is superior to that of recent years; yet we cannot help feeling also that but few of these works are executed for reputation: they are kept down to the common market standard. This is always to be regretted, because Art cannot stand still. We may choose for half a century the same class of subject, but if we realise our works always in the same manner, this is virtually retrogression. We have observed that this society is more slow than others to adopt that prevalent taste for high and minute finish, which is daily gaining ground—since this is purely mechanical, and we cannot help thinking that more elaboration would add a tenfold value to many of these works, which seem but the repetition of others, that we remember in series during many past years on these walls. It might seem invidious to individualise prejudicially in these few prefatory remarks; the exhibition is better than those of many years past. We proceed, therefore, to select a proportion for brief observation.*

No. 7. 'Arcangelo,' R. BUCKNER. Such is the title given to one of those studies of Italian life which the artist has of late painted with much felicity. It is true that any undue coarseness or vulgarity would be highly objectionable, but the features are, perhaps, carried to an opposite extreme, they are refined overmuch.

No. 11. 'Streatley Mill, on the Thames—a Summer's Morn,' H. J. BODDINGTON. A large picture presenting a passage of scenery essentially English. The effect is that frequently introduced by this painter,—a sunny day, the sun being kept just out of the picture. The water, trees, weedy foreground, and other passages of the composition, are brought forward with the masterly feeling which characterises all the works of this artist.

No. 16. 'My Boyhood's Home,' J. O'CONNOR. A small work, the subject of which is principally a shady avenue of garden-trees, leading to a neat residence. The study is by no means easy, but it is brought forward with much spirit.

No. 18. 'Off the Hermitage Rocks, Elizabeth Castle, Jersey Coast,' J. J. WILSON. We are almost too near these rocks to be said to be "off" them; it is, however, the most pleasing work we have of late seen under this name. Of the manner in which the water is painted, it must, however, be observed that the forms want solidity.

No. 25. 'The Hay-Field,' J. J. HILL. The subject is a group of two rustic figures, a youth and a maid, the former whispering and the latter listening to that most ancient of all communications, a declaration. The figures are freely and substantially wrought,

* It is to be regretted that this society continues to charge a shilling for the catalogue; sixpence would be sufficient, and we believe at that cost the remuneration to the society would be better than it is. In this age a large quantity of printing is expected for a shilling.

they come palpably forward, and the work is altogether brilliant and effective.

No. 29. 'The Castle Rock, Linton, Devon,' J. TENNANT. A charming copy of a wild yet grandly beautiful scene, highly finished, yet full of force and character.

No. 37. 'Early Morning,' J. DEARLE. The time is accurately told by the dull grey aspect of the composition. We find here an absence of that woolliness of which we have spoken elsewhere.

No. 38. 'Bathing Buffaloes in the Pontine Marshes,' J. B. PYNE. An extraordinary subject, but pointedly characteristic of the source whence it is derived. The animals are driven into the water, and not permitted to come out until they have in some degree cleared the pool of the rank herbage with which it abounds. Such is the fidelity of interpretation, that the spectator sees at once that the Campagna is the theme.

No. 39. 'Summer Evening—Bantry,' ALFRED CLINT. The sunny lustre of the ripple as it rolls in upon the shore is a feature that instantly attracts the eye from its extraordinary truth—but the other parts of the picture are not less veracious.

No. 45. 'The Beauty Spot,' T. ROBERTS. A very pleasing fancy portrait, painted with delicacy and skill; a little too broken, perhaps, but exhibiting much power.

No. 46. 'The Lily,' C. BAXTER. A production equal to the most finished of this painter's works; a study of a lady wearing a Spanish hat, and holding flowers in her hand. The great charm of these captivating studies is their exquisite colour, the beauty of the faces, and the enchanting delicacy of manipulation with which they are worked out.

No. 48. 'Music,' W. UNDERHILL. A pyramidal composition, presenting three figures, the centre one touching the strings of a harp. The personages are grouped, perhaps, too methodically; they are, however, firmly painted, though faulty in the drawing of the extremities, and deficient in refinement of character.

No. 44. 'Cup and Ball,' and No. 63. 'Gleaners,' W. GELL. Two very clever and highly-finished rustic groups of children.

No. 65. 'Castel d'Ostia,' J. B. PYNE. This is the well-known fortress near the mouth of the Tiber. We do not, however, see the sea, and the castle itself is removed to a little distance from the eye. Figures and a team of bullocks are seen in the foreground. The picture sets forth the utmost wealth of the palette, but there is no passage of colour here that could be subdued without its loss being felt.

No. 66. 'Going to the Ferry on the Danube,' J. ZEITZER. A principal in this composition is a ruined tower, past which numerous figures are hastening to, we presume, the water's edge. As in all this artist's works, the showy manipulation is unique.

No. 83. 'Venice from the Lido,' J. B. PYNE. We are glad to see Venice without the Palace, the Library, the Rialto, the Columns, St. Mark's, in short, without the hundred and one historical edifices which every artist who visits Venice thinks he must paint. Something new—Venice in the distance—refreshing sight! We have been counting the bricks and stones of Venice for the last thirty years, and have, of course, established a nodding acquaintance with every one of them. But this is a charming picture, a gorgeous sunset over the sea, surpassingly beautiful in colour and touching in sentiment.

No. 84. 'Portraits of Daughters of Captain Hopwood, of Hopwood,' F. Y. HURL-

STONE. In the heads of these two children there is much of that graceful animation which eminently distinguishes the youthful features of the studies of this painter. The composition is pictorially treated; they are busied in gathering blackberries.

No. 88. 'Portrait of Sir John McNeill, G.C.B.,' J. R. SWINTON. We were much disposed to doubt the accuracy of the catalogue in this instance. If the portrait resemble the subject, he is the most youthful G.C.B. that ever wrote these frequently hard-earned letters after his name. The character of the head is that of a student—a poet—an enthusiastic minister of the Muses.

No. 89. 'Un Dicitore della Buona Fortuna,' W. SALTER. A rustic seer beguiling a couple of maidens too willing to be deceived. The figures wear the ordinary dress of the Italian peasantry, and in character they represent very perfectly the class to which they may be supposed to belong.

No. 90. 'The Farmer's Nag,' H. J. PIDDING. A small composition, of which the principal is a small grey pony, likely to be an able supporter of any moderately-fed yeoman.

No. 97. 'Cottage Pets,' J. INSKIPP. These pets are rabbits that are contained in a hutch, on which is resting a girl in the act of feeding them, whose head only comes into the picture. The head is, perhaps, more detailed than others recently exhibited by the artist, but the other objects of the picture are alluded to rather by colour than form. The day for this conventional freedom is gone by; nothing now in art can be accepted save that which is drawn and painted.

No. 107. 'Ursula of Velettri,' R. BUCKNER. A carefully-drawn and well-painted study of an Italian rustic maiden, very strong in individuality.

No. 110. 'Eavesdroppers—the Asking,' J. CAMPBELL. This is a very remarkable work; the artist has contrived to make a disagreeable picture of an agreeable subject; it is, however, full of merit, manifesting great power, abundant in character, and, altogether, a production of great promise. We look to this painter as to one who will be "great hereafter."

No. 120. 'My Servant-Girl,' J. INSKIPP. We doubt not the truth of the title; she is engaged in shelling peas. We have often wished that this painter would not colour the necks and features of his figures with the same glaze or tint; this identity is never seen in healthy nature.

No. 130. 'The Druid's Temple, Cumberland,' J. P. PETTIT. A large picture, showing in one of its nearer sites the masses of stone whence the title is derived. If this be like the locality, we cannot help very highly commending the taste of the Druids for the picturesque.

No. 131. 'Portrait of Edward Mackenzie, Esq.,' W. SALTER. A full-length figure of the size of life, presenting the subject in an erect attitude, easy and natural. It is forcible and unaffected.

No. 134. 'A Pifferaro,' T. GOODERSON. A very successful study, that of a rustic playing on the Italian bagpipe. There is in the treatment of the conception a striking originality, with an agreeable dash of romance.

No. 140. 'Gone to the Crimea,' H. H. MARTIN. This is a creditable production—a profile portrait of a lady absorbed in the contemplation of her husband, who is, as the title tells us, far away.

No. 141. 'Master Frank,' T. F. DICKSEE. This young gentleman is playing with a

drum and bells; it will, therefore, be understood that he is not yet in the second half of his first lustre. The infantine portraiture of this painter is always marked by excellent quality.

No. 149. 'Neglected Flowers,' T. M. JOY. These flowers may be either the children that pluck them, or the flowers themselves. To place the children in shade is an independent perhaps daring method of treating them, but it is, nonetheless, successful.

No. 150. 'Mrs. Jas. H. Hulme, Cliff House, Barlow, Derbyshire,' P. WESTCOTT. A portrait of an elderly lady, attired in black. The reality of the impersonation, and the effective simplicity shown in this work, are among the most desiderated qualities of portraiture.

No. 151. 'The Wild Wood,' W. W. GOSLING. A large picture, wherein the manner in which the trees are drawn is most masterly. The divergence of the branches, showing them as retiring into the picture or coming out of it, is amply and truly realised. We see our way well into the thicket, and, had we time, would take a stroll through the forest, although the foliage looks so uninviting. We have never seen foliage so repulsively cold; any kind of warmth would be nearer truth.

No. 154. 'The Orphans,' S. S. MORRISH. Two little figures very pleasantly wrought, and in sentiment fully sustaining the title.

No. 155. 'Henry VII.'s Chapel, Westminster, painted on the spot,' H. WILLIAMS. A subject so unique could never be mistaken for anything else; the complicated details are very elaborately worked out.

No. 159. 'On the Welch Coast,' J. HENZELL. The principals here are two fish-girls, unquestionably like what they are proposed to represent, but from their reality deduction is amply made by the newness of everything around them. The picture is a study of textures, to which everything is sacrificed. The rocks look new, the dresses are rubbed threadbare for the nonce, the rocks and stones are theatrically new, and even the atmosphere is new without being fresh. Very little is wanted to bring the whole into every-day harmony—a glaze were enough.

No. 164. 'A Liege-of-Battle Ship firing a Gun at a Waterspout in a Storm,' C. A. MORNEWICK, Junior. A production of considerable power: an original subject treated with masterly skill.

No. 166. 'Bantry Bay, South of Ireland,' ALFRED CLINT. A very romantic subject, brought forward with such an expression of space, that everything maintains its relative site, and nothing is lost. The eye is very artfully led from distance to distance till the entire ample space is closed by remote mountains, the interval being broken, and here and there forced into light by the flitting shadows of the driving clouds. We read here of the most common phenomena of nature, and these, after all, are the most difficult of description in painting.

No. 178. 'Welsh Children Woolpicking,' E. J. COBBETT. From the treatment of the subject it seems probable that the artist has seen this incident and has represented it as it appeared to him. A cottage is the scene of the labours of the group, of which the light is broken in a manner to bring the figures substantially forward. The children are painted with the utmost nicety, the transparent shades being realised with perfect truth.

No. 179. 'Narrative of an Engagement,' T. CLATER. The narrative is read from a newspaper to an attentive audience in a shoemaker's shop, the shoemaker himself being the principal figure of the group. It

is among the best of the artist's productions, all the still life in the composition has been most conscientiously worked out.

No. 186. 'Loch Long,' G. COLE. A well-chosen subject, the composition is charmingly diversified with the most romantic features of lake and mountain. The sky and the distant hills are passages distinguished by much fine feeling.

No. 190. 'Portrait of the Lady De Mauley,' J. R. SWINTON. We cannot help thinking that in the portraiture of which this is a most favourable example, the best points of identity are sacrificed to sentimentality. We see continually in such works the nose lengthened, the upper lip shortened, the eyes enlarged, and the cheeks almost colourless. In this portrait we see much of this kind of affectation, which after all is very much less difficult to paint than any of the thousand and one diversities of natural expression.

No. 199. 'Tenants of the Forum Romanum in the Nineteenth Century,' F. G. HURLSTONE. The title suggests a comparison, but it is rather of the present and the past of the locality, than between the impersonations before us and those who might have basked there in the sun of two thousand years ago. The faces of those who vowed by Hercules and the Temple of Apollo, were quite as handsome as those who now swallow miles of macaroni, and supplicate you for a *bajocco*. This is the class of subject which this artist painted years—long years ago—and he has never been more successful in anything else.

No. 201. 'The Golden Age,' F. UNDERHILL. The artist is right in substantive effect but he is poetical in prose. The golden age is something to dream of; but we find ourselves here invited to join the dance by nymphs with the most common-place faces. We cannot therefore raise ourselves beyond our every-day age of iron. These same ladies we have seen as late as last summer haymaking in Essex and hopping in Kent; the Arcadian delusion is at once dispelled. There is very much to praise in the picture, but were it a little more classic it would be very much nearer the spirit of the proposed subject.

No. 217. 'Landscape with Cattle crossing a Stream—Kenilworth Castle in the distance,' H. HAWKINS. A very interesting subject full of material, the ruin pronounces itself at once to be Kenilworth.

No. 218. 'A quiet Morning on the Coast of Arran,' J. W. OAKES. This is striking and forcible in its treatment. It is generally low in tone, and the aspect of the sky threatens rain, an effect which we feel at once to have been closely imitated from nature.

No. 223. 'River Scene and Cattle,' T. F. WAINWRIGHT. This picture reminds the spectator of Cuyp. Imitations like comparisons may be odious, but it is better to succeed in some degree in following a good master than a bad precept. The light and warmth of the work are at once felt, and there is otherwise much to commend.

No. 226. 'Scene near Great Marlow, Bucks,' A. F. ROLFE. A small picture, firmly painted and generally agreeable in composition. No. 237, also by this artist, and entitled 'View of Windsor Castle from Romney Island,' is not less creditable.

No. 238. 'Good News,' J. NOBLE. A small life-sized head—that of a lady intent on reading a newspaper. It is agreeable in expression and life-like in colour.

No. 244. 'Caves in the Lias—South Wales,' W. WEST. When we look at this work we are surprised how little of subject-matter with judicious painting will make a picture.

The material is only a passage of sea-cliff running into the picture; but the perspective is most accurate, and every cleft and fissure is carefully drawn and painted; the whole presenting an infinity of elaboration. It is truly a geological study, but it has perhaps too much pretension to give it a geological title.

No. 248. 'Prophecy of the Destiny,' S. ANDERSON. This title is too obscure to assist in anywise the picture, or to elucidate the point of the subject. There are two figures—one of a child sleeping, clasping what seems to be a doll; and standing in contemplation of the sleeping child is a female figure, perhaps the sister. The light is well managed, but the multitudinous folds of the drapery confuse the composition. It is, notwithstanding, a very touching and impressive picture, and cannot fail to give pleasure.

No. 250. 'Pilate's Wife saying to him—"Have thou nothing to do with that just man; for I have suffered many things this day in a dream because of him,"' Matthew xxvii., 19,' J. Z. BELL. The figures in this composition are well executed, but they are deficient in character and nationality. There is also a want of state and presence in the principals. It happens too frequently that artists paint nothing but the models they see before them, without reference to what might have been the impersonations of the characters presented.

SOUTH-EAST ROOM.

No. 263. 'Sunshine and Showers—a Fishing Weir on the Thames,' H. J. BODDINGTON. A large upright picture with a menacing sky; in execution the picture is perhaps less fortunate than are usually the productions of the painter.

No. 267. 'Pastoral Scene at Maxfield, near Hastings,' J. J. WILSON. The composition shows a small farm-house, with trees and other appropriate incidents; and were it not that the foliage is unnaturally cold and metallic, there is more truth in this and the other like subjects painted by the artist than in his marine subjects. By the way, the title is a misnomer—the subject may be rural, but it is not pastoral.

No. 273. 'Lady Godiva,' A. J. WOOLMER.

"The woman of a thousand summers back,
Godiva, wife of that grim earl who ruled
In Coventry."

Almost any semi-nude female study may be turned into a Godiva. We find her here undressing for her penal promenade. There is a shadowy allusion to a caparisoned horse under a distant portico; but for a subject so popularly understood, it is not enough that the figure be painted with much sweetness as to character and colour. If a story be proposed, it should be told in conscientious drawing and painting—a sketch is not enough for perspicuity of narrative.

No. 275. 'A Scene near Dolgelly,' J. SYER. This composition is got up with breadth and force; the proprieties of the theme are developed with good taste, and all the insignificant and unimpressive incident which might be brought forward in such a picture is with good feeling omitted. The principals of the composition are a torrent foaming as it rolls over its rocky bed, a screen of trees, and a glimpse of distance,—harmonious in colour and decided in manipulation. The treatment is somewhat loose, yet, on the whole, there are few better landscapes of our school.

No. 280. 'Portrait of Lieutenant-Colonel Cowell,' R. BUCKNER. A full-length portrait, presenting the subject in the act (we presume) of leading troops to an attack;

but this idea is by no means supported by the dark background. The hands strike the spectator at once as being altogether too small.

No. 281. 'The Shepherdess,' J. J. HILL. She is asleep, but not in a very easy posture, with her dog lying by her. The treatment is that generally followed by this painter—the group or figure being presented in a broad and open field of view.

No. 283. 'The Merry Thought,' H. J. PIDDING. This title is given to a study of a country girl, who is laughing at some quaint conceit. The features are in a high degree expressive of hilarity.

No. 286. 'Abd-el-Kader,' R. BUCKNER. It is not like those portraits of the Emir that are usually considered authentic. Whether Abd-el-Kader sat for this head or not, we cannot say: if he did not, it is at least bad taste to exhibit the work with a title which may lead to a supposition that it is an authentic portrait.

No. 295. 'The Broken Bridge in the Hartz Mountains,' J. ZEITZER. The subject is brought forward in a manner to convey an impressive idea of the difficulties of travelling in such a region; it is wild and dismal enough for the abode of all the demons of the tempest.

No. 303. 'A Mountain Shepherd's Home,' J. P. PETTIT. This home is a cottage, immediately behind which is a rocky perpendicular eminence, a striking feature of the mountainous character of the region whence the subject may be derived. It is very carefully painted, but it will be felt to be too grey in colour.

No. 313. 'A Neapolitan Peasant Boy,' F. Y. HURLSTONE. For the class of subject, there is perhaps too much refined sentiment. The head, like all similar youthful essays of this painter, is a charming study.

No. 316. 'Preparing for a Bal Masque,' J. NOBLE. A pendant to this work is numbered 318, and entitled, 'The Return from a Bal Masque.' In each is seen a trio of ladies; but in the composition showing the preparation the subject is most perspicuous.

No. 317. 'Autumn,' C. BAXTER. A small picture, containing one figure, that of a girl carrying a small basket of fruit. Like all the heads painted by the artist, the especial characteristics of this are sweetness and simplicity. It is everywhere highly finished, and most captivating in colour.

No. 330. 'Going to Market—Road-scene near Llangattoch, Breconshire,' J. TENNANT. A large picture, presenting an expansive diversity of Welsh scenery, and leading, as is customary with this painter, the eye to remote distance, till the objects are veiled by the filmy atmosphere.

No. 335. 'Storm—Fishing Boats running into Harbour,' ALFRED CLINT. We are placed here close in shore, at high water, with a gale blowing off the sea. The water is still deep, and immense volumes of water are thrown in upon the rocks; a large ship, already a wreck, is driving rapidly in among the breakers; and the small craft are running in shore for shelter. The description is impressive, and the heavy surging sea is painted with a daring sharpness which can only be ventured on from close study of the forms assumed by water under violent agitation.

No. 336. 'Virgin and Child,' W. SALTER. This is a subject rarely treated in modern art: it is a small picture, showing skilful grouping, and much brilliancy of colour.

No. 337. 'On the Coast, near the Valley of Rocks, Linton, Devon,' W. WEST. Altogether in the good feeling of the works already noticed by this painter, who renders these stratified rocks with great truth.

No. 338. 'On the Barmouth Waters, North Wales—Mid-day,' H. J. BODDINGTON. An effect frequently treated by this painter: it is here realised with the success which usually attends him in these essays.

No. 345. 'Running into Port,' G. COLE. From the title alone we learn that there is a storm coming off the sea: it is sunset, and the aspect of the heavens warns the scared small craft to their places of safety. The story is told in simple but forcible terms.

No. 349. 'Nature's Toilet,' T. R. POWELL. A small composition, presenting a semi-nude female figure dressing by aid of the reflection in a garden basin. It is very attractive in colour, and otherwise skilfully executed.

No. 360. 'The Embroideress,' E. J. COBETT. A most pleasant fancy portrait, very ably treated.

SOUTH-WEST ROOM.

No. 385. 'Ehrenbreitstein, and Bridge of the Moselle,' V. DE FLEURY. This view is taken on the Moselle, a little above the bridge, and looking over towards the "Gibraltar" of the Rhine. Although the importance of the fortress is diminished by the bridge and near objects, it presents an imposing view, which is enhanced by judicious treatment.

No. 391. '***', G. WOLFE. This is a sea-coast scene, very earnestly painted, but deficient of breadth.

No. 392. 'Drying the Nets,' J. HENZELL. The dispositions here are creditable, but the work partakes of the disqualifications we have already noticed in the works of this painter: there is a marked crudity of colour which is not natural.

No. 403. 'The Weald of Sussex, Chanctonbury Downs in the distance,' G. COLE. There is some excellent subject-matter in this district: we are surprised that it is so little visited. This is one of the best works we have seen exhibited under this name.

No. 419. 'The Rheinfels, looking towards Thurnberg,' E. J. NIEMANN. A subject that very few painters would select. The objects in the foreground are fallen ruins, and the aspect near and far is wild to a degree.

No. 434. 'Portrait of Lady Eden,' F. Y. HURLSTONE. A very graceful impersonation: it is among the best of the painter's works.

No. 435. 'Return from the Ball—Sunrise,' A. J. WOOLMER. These preparations for, and returns from, the ball, constitute at present a very favourite class of subject-matter; and they are principally ladies who, in the latter case, are represented as returning home at all hours of the twinkling stars, even till the sun is well up in the sky. We find here accordingly a lady, as usual, charming in colour; but, whether she is in boudoir or bed-chamber, cannot be determined by the upholstery of her whereabouts. With the exception of the figure, the composition is beautifully indefinite.

No. 436. 'A Fall in the Snow, near Presburg, Hungary,' J. ZEITZER. A small picture; the best we think exhibited by its author.

No. 438. 'The Rendezvous,' J. NOBLE. A small picture, presenting a gentleman wearing the cavalier costume of the seventeenth century. It is agreeably coloured.

No. 449. 'Laying Monster Tubes from the New River,' J. B. PYNE. This subject transcends even the utilitarian; it has scarcely as much of the picturesque as we sometimes see in an engineering draught; but even to this subject is communicated a surpassing charm: it is the effect of sunshine under which these huge tubes, and all about them, are brought forward. This is an essay truly masterly.

No. 452. 'Flowers,' MISS RIMER. This study is much in the taste of a foreign school: it is, however, painted with firmness and truth.

No. 453. 'Study of Trout,' H. S. ROLFE. A couple of fish, in which every natural characteristic is most perfectly realised.

No. 459. 'A Country Boy—from Nature,' W. HEMSLEY. This little picture sustains the reputation of the accomplished artist—and that is saying much.

No. 462. 'A Welsh Ford,' G. SHALDERS. The subject is brought forward under a subdued light, with the moon rising. The sky, distance, and the general breadth of the composition, are highly commendable.

No. 465. 'Lock Katrine, Looking towards Ellen's Isle,' J. DABBY. Really a brilliant and powerful production. We look up the lake at a late hour of the day, when the sun casts a profusion of golden and mellow light on the entire scene. This series of works will remind the spectator of Richard Wilson, whom, perhaps, they sometimes suggest too positively.

No. 466. 'The Old Avenue,' A. J. WOOLMER. Well and substantially treated, though not without manner. There is more of reality here than of that playfully obscure allusion of which we have elsewhere spoken in these works.

No. 472. 'The Rest,' C. BAXTER. A new class of subject for the painter; and one in which, be he ever so successful, he will never surpass those charming essays upon which his reputation is so firmly based. The figures here are a rustic mother with her two children.

No. 479. 'Home through the Heather,' E. J. COBBETT. Those who are thus moving homeward, are a group of cottage children laden with fern. The figures are distinguished by much sweetness and simplicity.

No. 504. 'Near the Head of Loch Katrine,' G. COLE. This recalls at once the locality. The light and atmosphere are very felicitously managed.

No. 506. 'The Bridge of Sighs,' E. BARNES. This composition seems to have been suggested by Hood's Poem: it contains a group of figures removing from the water, by torchlight, the body of a woman who has drowned herself. We are surprised that the subject has not been treated more frequently. There is much to praise in the picture: it is worthy of being painted larger, being characterised by all the earnestness of good Art.

No. 536. 'A Portrait,' J. R. SWINTON. A study of a female head; very loose in execution. Such works in exhibition do not assist a reputation.

No. 537. 'Une Soirée,' J. HAYLLAR. The title is not intelligible as applicable to the picture, of which the subject is a small society of men, whom the most unprejudiced person would at once pronounce to be *garrotteurs*. They are engaged in a rubber. The French title does not suggest any mirthful idea. The future fate of these gentlemen is evident: they are even beneath the respectability of the ticket-of-leave.

No. 551. 'Near Barmouth, North Wales,' ALFRED CLINT. This work is very successful in its description of space; it presents to the eye a vast expanse of country, comprehending all the elements of the beautiful.

No. 568. 'The Exercise of the Fan,' T. ROBERTS. The subject has already been treated in a large composition; here it is interpreted by a single figure, that of a young lady, with that number of the "Spectator" before her which suggests the flirtation of the fan as a science. The head is very delicately painted; indeed, it is, throughout, a careful study.

No. 571. 'A Garden Scene,' J. FRANKLIN. A small composition, freely touched, containing an agroupment attired in the taste of the seventeenth century.

No. 574. 'Ferry-boats at Gean on the Danube,' J. ZEITZER. The spirit of these sketches is equalled by very few that we ever see in this dissipated but sometimes pleasant manner.

No. 584. 'Toinette,' J. E. COLLINS. A study of the head of a girl in green drapery. It is fresh in colour and otherwise creditable.

No. 589. 'The Youthful Days of Mary Queen of Scots,' F. COWIE. So rarely do we see anything new in the way of subject-matter, that we cannot pass it without remark. We find Mary here with her uncle, Francis, Duke of Guise, and his wife, Anne d'Este. She is kneeling before him, and he is amusing her with tales of his wars. It is a happy subject, and bespeaks reading and thought.

No. 603. 'Job and his Friends,' C. ROLT. The force and substance which the artist has given to the patient man diminishes the reality of the other figures. The artist has had recourse to the Nineveh marbles for his costume.

No. 619. 'A Sketch,' P. WESTCOTT. A profile of a man's head, natural in colour and firm in manner.

No. 625. 'The Ballad,' A. BOUVIER. A small composition, agreeable in colour, but very faulty in drawing.

The Water-Colour Room contains a great variety of essays, among which the most prominent are—No. 637, 'The Green Market, Amiens,' J. DOBBIN; No. 645, 'Flowers,' V. BARTHOLOMEW; No. 655, 'Brig lying-to for a Pilot,' C. P. KNIGHT; No. 661, 'Summer Fruit,' MISS ADAMSON; No. 662, 'Interior of St. Paul's, Antwerp,' S. READ, a production of great merit; No. 668, 'Valley of the Medway,' R. P. NOBLE; No. 673, 'Flowers—Hollyhock,' MISS ASHEY; No. 674, "What! shall we have incision? shall we imbrue?" R. W. CHAPMAN; No. 692, 'Grapes and Quince,' MISS STEEDMAN; No. 697, and following numbers, 'Souvenirs de l'Opera,' J. R. POWELL; No. 711, 'Portrait in Crayons,' T. SENTIES; No. 712, 'Portrait of Mrs. Frances Hammond,' MISS ROBERTS; No. 713, 'Roses,' MISS F. JOLLY; No. 724, 'The Rev. H. H. Beamish,' S. B. GODBOLD; No. 728, 'Miss Pickard,' CLARA E. F. KETTLE; No. 731, 'Portrait of Miss Burnaby,' J. HAYTER; No. 738, 'Robin,' MRS. WITHERS; No. 739, 'Moor Hen,' P. HOLLAND; No. 752, 'The Path through the Glen,' A. STANLEY; No. 762, 'Rydal Lake, Westmoreland,' C. PEARSON; No. 769, 'Enamel on Porcelain, after Etty, in the Vernon Gallery,' A. ROGERS; No. 777, 'Ravine near the Summit of Carnedd, Carnarvonshire,' W. EVANS; No. 785, 'Abbeville,' S. READ; No. 792, 'Richmond Park,' R. P. NOBLE; No. 799, 'Wickham Church, Kent,' R. NOTTINGHAM; No. 806, 'Little Red Riding Hood,' W. BOWNESS; No. 809, 'Fern Island, Coast of Northumberland,' T. HARPER; No. 815, 'Grapes and Pomegranates,' MISS STEEDMAN; No. 817, 'Study from Nature,' W. BOWNESS, &c. There are only three sculptural works—'The Industrious Girl,' and 'David playing the Harp whilst a Shepherd,' G. FONTANA; 'Bust of Marshal Pelissier,' F. B. TUSSAUD.

The catalogue, as we have observed, is more lengthy than usual, and the best works are those of the members; but it must be observed that, inasmuch as they themselves occupy all the best places, there is still little temptation for non-members to contribute pictures which they may have carefully elaborated.

THE ROYAL PICTURES.

THE CHILDREN IN THE WOOD.

J. T. PEELE, Painter. H. BOURNE, Engraver.
Size of the Picture, 3 ft. 7 in. by 2 ft. 3 in.

A LOVE of Art, no less than the desire to cultivate any taste or faculty which nature has implanted in us, will develop itself in whatever circumstances an individual may be placed, although the rapid growth of such taste and faculty can only be expected when it is under the influence of an atmosphere most favourable to it. The records of many artists bear evidence to the truth of this assertion; and we find another instance in the history of Mr. J. T. PEELE, the painter of "The Children in the Wood." He was born at Peterborough, Northamptonshire, in 1822, but migrated with his family, at the age of twelve, to America. After wandering for a considerable time from one State in the New World to another, in the hope of finding a locality that presented some prospect of success in business, the family at length settled down at the town of Buffalo, on the borders of Lake Erie. In this remote place the artist, for the first time in his life, saw an oil-picture by gaining access to the studio of an itinerant portrait-painter, whose works, whatever their merit or demerit may have been, awakened the Art-spirit within him, and made him ambitious of becoming a painter. But his father discouraged all such pursuits: he entertained the idea that Art was a "low occupation," and that idleness had prompted his son to select it, and he threatened to eject the boy from his home if he did not relinquish his purpose. In spite, however, of opposition and all kinds of difficulties he persevered; and as his father would not furnish him with money to buy materials, he begged a few dry colours and a little oil from a house-painter, manufactured a palette out of the lid of a cigar-box, and set earnestly to work on the portraits of his brothers and sister, whom he caused to sit to him day after day as models.

After some considerable lapse of time the father yielded to the inclinations of the youth, and supplied him with small sums of money to purchase materials, and at the end of a year or two he ventured to receive sitters for a trifling remuneration, and made so much progress that his father began to take a more liberal view of the profession, and furnished him with the means to study in New York, where he remained a year and a half—not greatly to his advantage, however; for while in Buffalo he studied nature alone, though without any definite knowledge of principles to guide him, in New York he was exposed to the danger of imitating the works—and these too, it may be assumed, not of the best order—of others.

On leaving New York, Mr. PEELE came over to England, at the request of his friends here, who promised him patronage, which it was subsequently found could not be realised. After remaining in this country for three years, without profit in any way—for his means would not admit of studying in London—he returned to New York, partly abandoned portraiture, and commenced ideal pictures, in which children form the principal feature. His success was commensurate with the industry and talent displayed; he was elected a member of the National Academy of Design, and enjoyed the friendship of the most distinguished American artists. At the end of seven years he once more visited England, where he seems now to have finally settled down.

Mr. PEELE, since his residence among us, has been a constant, though not a large, contributor to our exhibitions. In his pictures he aims at, and generally succeeds in, embodying the principles of high Art into the portraiture of children; and thus to remove the objection against the insipid and conventional style in which these charming little models are generally represented.

His picture of "The Children in the Wood" is skilfully treated, but the "babes" are of a more humble position in the social scale than those which the old ballad speaks of. It was purchased by His Royal Highness Prince Albert, from the Society of British Artists, and is now in the collection at Osborne.

JOHN THOS. PEELE, PINX.

H. BOURNE SCULPT.

THE CHILDREN IN THE WOOD

FROM THE PICTURE IN THE ROYAL COLLECTION

A FEW WORDS

ON OUR NEAR NEIGHBOURS' TASTE
AND OUR OWN.*

BATTLE PICTURES—"PUNCH" AND THE "ILLUSTRATED LONDON NEWS"—ARY SCHEFFER—CONCENTRATION IN ART—PAUL DE LA ROCHE—CHOICE OF SUBJECT—COUTURE'S PICTURE OF "THE DECADENCE OF THE ROMAN EMPIRE"—PAINTING, SCULPTURE, AND DECORATION.

Present—MAGISTER and AMICUS.

Amicus.—I dare say they do send many a fine young fellow to the wars, for there is a deal in these battles of Verue't's to stimulate martial adventure and stir the mind. They certainly do this. They stir the mind; and I, for one, would not give a fig for a picture that does not do this in some way or other. Mere workmanship does not satisfy me, however good it may be; and, although I confess I should not like a battle-piece in my room, if battles *must* be painted, they should be thorough no doubt, and not sham-fights.

Magister.—They cannot be left wholly out of Historic Art, any more than out of History; and maybe are as indispensable in the one as in the other. But no,—they have not quite this excuse, inasmuch as a history—such as Napier's of the Peninsular War, which describes a series of battles and military manoeuvres—gives an actual account of what took place in each engagement, as far as records and recollection and documents go, without indulging in imagination or being forced upon it. While, on the other hand, the painter can only execute his work *by means* of his fancy. All he can do is to take a principal fact, and present it by the most likely groups, &c., that he can select from his ideas. These must be drawn from himself and cannot be actual, except by a chance so remote that it can hardly be taken into account. The life and death interest of a battle is so absorbing, that the coolest head cannot carry out of the field any dependable recollection that would serve faithfully the painter's art—the strangest contradictions as to details proceeding even from those who have been close actors. At such a time near combatants and dear friends are in total ignorance of what each other is doing; such is the dust, smoke, turmoil, thunderstorm, whirlwind, and hurricane of a mortal struggle! And the General guiding all is so occupied with his dreadful game of chess and its stake, that of course he does not notice the groups of his men or the incidents of the contest, except from a military point of view. So much is all this the fact, that there appears to be next to no chance, out of all the battle-scenes that have ever been painted, that any one representing a near point of view should be a truth.

Amicus.—Vandevelt used, I think it is said, to follow the fleets of his country in his own yacht, and make sketches of conflicts at a distance.

Magister.—At a distance; but those were naval conflicts, in which the ships, sky, and seascape formed the subject, and not hand-to-hand struggles. Thus such may be more easily faithful to fact than land conflicts, the higher class of which, as *works of Art*, cannot be depicted except from near points, which nothing but an instantaneous photograph could give data for, and which it would require a bold artist to manipulate, even if he could get more allowance from the general to be "in the way" than even the *Times*' reporter.

Amicus.—But other historic works of Art, even of the most peaceful kind, cannot pretend to be actual facts in their details.

Magister.—Not wholly so, but there is more opportunity to obtain these, as the actors are not absorbed to the same degree, and there may have been spectators to leave records affording precise information, &c. &c.; but the more peaceful scenes do not, I suppose, require the same excuse for representation as we were thinking that battle-scenes do. In this view battle-

scenes are introduced into Art only as forming an indispensable part of History, while other historical subjects are chosen for their moral or pleasing nature, requiring no excuse for representation. You said you would not like a battle-scene in your room as a constant subject of contemplation. But there are other subjects of history that would be always acceptable.

Amicus.—Historical incidents, however, rather than historical events. For my own room incident, for a neighbouring gallery event; but *à propos* of photographs, what a photograph that would have been—to have been painted by the sun when it broke out after three days rain on the evening of Waterloo—just as the last French charge was made and over!

Magister.—It often occurs now, in reading history, what invaluable things photographs would be of such-and-such events, and such-and-such characters! Photographs are already part of history, and will become still more as the art advances. But *à propos* of the 18th of June, 1815, I think if I had a photograph of that day, I would keep it to myself for the present. To speak in parliamentary phrase, it would be a curious return to get—the number of representations of that action that have been made and sold in Great Britain during the forty years that have elapsed since it took place—sufficient, I should think, for the present century.

Amicus.—We can't ignore Waterloo!

Magister.—But we need not emphasise it.

Amicus.—Or we should have to rechristen Waterloo Bridge and no longer foot it in Wellingtons!

Magister.—Bluchers were as *mal-à-propos*. I would not rechristen Waterloo Bridge; but were we to build a bridge now I certainly would not call it by that name. That battle—if once our strength—is now one of our national weaknesses. I have a theory that about eleven at night—unless there be some other special subject of interest—a party of Englishmen always begin to talk about Waterloo!

Amicus.—It comes in about the third cigar!—perhaps so. Well, we have other battles to "fight o'er again" now, and to paint—the Alma, and Inkermann, and Sebastopol. And so we may hang these over the other for the time being—as they do the modern pictures over the old ones in the Louvre.

Magister.—One quality of the great Duke's was his being to time—and his retirement from this mortal scene, be it spoken in reverence, accorded with this. Let us learn by him: and now that he has left us, and there is no annual banquet to celebrate the great day, leave the record of Waterloo to the page of history.

Amicus.—In Art we can well afford this, especially as we are agreed that we do not admire gory scenes. Still, however, we must not, I fear, flatter ourselves that we are really so very peaceful in our tastes. We may, it is true, turn away in disgust from the presentment of the more horrible actualities of war; yet it may not be denied, that if you see a shop-window with an engraving or picture of a battle in it, there are sure to be plenty of people looking at it. And see that ingenious caterer for us all, the *Illustrated London News*, who so well knows how beats the pulse of the public. There is never an action takes place, but a picture of it soon, marvellously soon, appears in that publication.

Magister.—Yes, marvellously soon, especially if you take into consideration the drawing and woodcutting. But this promptness and information must be little short of miraculous to the good country people, who doubtless religiously believe, as an article of faith, in the authenticity of all the details and pictured episodes, and of the actions and expressions of the people who are slaying and being slain!

Amicus.—What happy unsophistication; what would I not give to be in such a primitive state!

Magister.—Really, without hyperbole, however, some of the battle sketches produced in that periodical are among the most remarkable efforts of the time. They are done sometimes with great rapidity, by one of the artists especially, who thinks nothing of designing and dashing off a battle-piece *impromptu* on the wood

block, ready for cutting, while the printer's devil waits for it!

Amicus.—The marvel of that depends upon how long the printer's devil has to kick his heels in the hall before he gets it. Those sable gentry have often to wait a good while—waiting is one of the "institutions of their existence."

Magister.—I mean but an hour or so. These works, indeed, are looked at merely as sops for the public thirst for "true and particular representations of a late interesting and exciting event," and are apt not to be viewed enough as works of Art, although they satisfy so many requirements of it. There may be also some "pride of position" and Art birth-right about some of your regular built artists, which would seek to draw a line between the talent requisite for a regularly constructed picture, or statue, or *aquarelle*, and that manifested in these sketches. Assuredly all clever sketches might not "finish" equally well, but I have seen many sketches of the nature of which we have been speaking in the *Illustrated News* which would finish, to the best of my belief, admirably well, and which for spirit, action, variety, and expression, were not to be surpassed.

Amicus.—And how wonderfully some of them give the idea of distant multitudes with but a few hasty but artful strokes, on examining which you can hardly conceive how the effect is produced!

Magister.—Many of the impromptu pictures in that journal are true works of genius. They are, to be sure, in some degree ephemeral, but so are leaders in the *Times*—the more the pity for both—but they are none the less excellent for that.

Amicus.—Certainly I have seen nothing in France equal in their way to our illustrations in *Punch* and the *Illustrated News*. Is not that rather strange? One would have expected just the reverse.

Magister.—It is hopeful for our Art-strength here, showing its real resources when called upon. There has been of late years a substantial demand for pictorial illustrations of the characters, events, and humours of the day, also for comic sketches of them, and it is well responded to. I quite agree with you that one would have anticipated that these were just the points in which the readiness of invention and execution, and the laughter-lovingness of our near neighbours would have given them advantage over us, and yet it is not so, for undoubtedly these two periodicals are superior to anything of the kind they produce. The demand for "periodical" Art is one of real commercial character, and behold how excellent is the supply. Long may these publications strive to keep their Art-work up to the highest level that the people demand. In this way they do vast good to the people and to Art; teaching the people through their eyes, that short road to the brain, and spreading among them a love of graphic pictorial and formative representation. I look indeed upon the class of publications which the *Illustrated News* and *Punch* represent, to be most valuable adjuncts to our progress. Their advantages are not confined to us, or even to those who speak our tongue,—as the language of the eye is universal—but spread their benefits through the world. What a public they have! They are true circumnavigators! Here—in this country—they have become integral portions of our Art. Taking their rank moreover as *sketches*, the light craft of the Art, they do a deal of good by whipping up your regular seventy-fours and three deckers to greater exertion. It would not do for the men of heavy metal to fall astern of these sloops and gun-boats! I believe that one influence of the excellence of our present periodic graphic illustrations is to raise the general standard of composition. Their excellence would never permit illustration in this country to sink again to the level of many of the plates in Boydell's illustrations of Shakspeare,—of which—I mean the bad ones—and other tame pedantic representations of that ilk, the last century bore no small crop. The wood-drawing and engraving of the present day is for Art what printing is for Literature. We can never again have a "dark age" in it.

* Continued from p. 99.

Amicus.—Then long life to them! I hope, however, that the "events of the day" may soon direct their pencil to softer scenes. We were talking of battle-pieces and Vernet's power in them, and the general vigour displayed by the French artists in their treatment of these subjects; but there is a style which is the direct reverse of this, in which France is also great. Are not Ary Scheffer's productions the perfection of taste and abstract refinement? A frankness of sentiment appears to hover about them! The beings of his pictures appear to live in a cloud region of essential existence. An angel element of pure air!

Magister.—There is indeed a peculiar delicate spirit in his creations that charms us, in spite, not unfrequently we must allow, of defective proportions and eccentric arrangements, just as we are smitten by the sweet expression of a female face of which the features are not regular. I know no works in which the magic of taste is more fascinating than in his.

Amicus.—And yet he seldom in them, in extent, goes beyond an ode or a sonnet.

Magister.—That is a chief cause of their quality, and he is led to it by his love of concentration, which he possesses in perfection. Everything superfluous is shred away. Nothing is left that does not tell its story compactly. In this, combined with refinement, lies his strength. I wish our artists would keep this a little more in mind; as the orator emphasised *action*, so would I, had I the powers, emphasise *concentration* as the essence of true force in Art. *Three figures are enough for the highest effort in Art.* Those in general are the best subjects that require no more. At any rate they supply the best mode of an artist's laying out his time. For in a picture treated in the *multitudinous* manner, and in which the *crowd* is relied on for effect—and I hate a crowd of all kinds,—a quantity of work that might be *so*, or might be *thus*, or might be *here*, or might be *there*—and is not essentially and vitally compacted with the main group and thought takes a long while to do, and is not of adequate effect, and only dilutes the work. While, on the other hand, how forcible is "everything in its place"—nothing but what is wanted—which must be *so* as it is done—and not anyhow else. As a high work of Art is not from any chance point in nature or history—but from a selected point, so should the details be selected. And the more the grosser particles are boiled away, the purer is the essence, the stronger the spirit, and the truer the result as a work. Just as with the poet, whose mission is, not to lead you over heavy acres where you have to make a long excursion and traverse many a weary step to collect spare flowers, but to conduct you at once to the springy turf of a fresh meadow, rich with perfumed plants, or to a garden, where every step affords a fresh floweret. As in the drama the highest effects are produced by a few characters, and in music the most exquisite and affecting airs by a few simple chords, so is Art most forcible when she is closest to her theme, as comets are swiftest when nearest the sun.

Amicus.—At the same time it is evident that some of the most remarkable works of Art contain a multiplicity of figures, as the School of Athens, of Raphael, or the "Last Judgment" of Michael Angelo.

Magister.—Rather, perhaps, many groups than one multiplicity. Several pictures in one, each with their separate interest—but no crowd, and no superfluity—and thus neither of these works produce their full effect until the mind separates them into groups and separate interests. To these subjects many figures were *essential*. They could not be represented *otherwise*, but this is on a very different principle from that—not, by the bye, to be called a principle—which introduces a quantity of make-up figures to fill up the canvas, while the interest is confined to one small portion. Also in the case of both these great masters, I doubt whether their many-figured works would have excited so great admiration, had not their reputation been supported and their power exercised by works of lesser extent, and more concentrated sentiment. For my part, in the Sistine Chapel

itself, I am more impressed by the simple and individual figures of the Prophets and Sibyls than even by the great wonder and triumph of powers that occupies the end, simply because they are each a *concentration*, while the "Last Judgment," taken as a whole, and not in groups, is a *diffusion*; and the class of works produced by Raphael, on which his fame most firmly reposes, is surely that to which belongs the "Madonna del Sesto," with its wonderful divine infant; the "Madonna della Seggiola," &c. The great master, however, should of course be equal to the various requisitions of his art, among which are, doubtless, the filling of large architectural spaces, and the record of historic events comprising numerous personages, and in either case a large number of figures may be essential. As a general axiom, however, the stories best worth telling, are those which can be told with fewest figures.

Amicus.—The "School of Athens" reminds me of the great picture of De la Roche's in the Hemicycle, at the Ecole des Beaux Arts, that has just been injured by fire. It was evidently suggested by Raphael's work.

Magister.—It is fortunate the injury has occurred during the artist's life, so that it may be repaired by his hand, and still he De la Roche's instead of Mr. Somebody else's, the picture repairer. As you say, its plan is in some respects that of the School of Athens. It is a child worthy of the parent, and especially in the harmony of its plot—a collection of pictures in one—not a crowd, but a series of groups, each to be regarded in turn; and this is favoured by the horse-shoe form of the wall on which it is executed, which, bending round the spectator, prevents the whole work being presented at once. Its treatment is strictly in accordance with the architectural arrangement. It is a noble, thoughtful, philosophic composition, or series of compositions, full of dignified repose, and of the biographic-historic class, but not of the dramatic and thrilling interest on which this great artist so often loves to found his works.

Amicus.—Not like the "Death of Elizabeth," or "Cromwell regarding in its coffin the body of Charles," or of the "Murder of the Duke of Guise!"

Magister.—All of which are full of vigour and reality, both in conception and execution. They may savour, especially the last, somewhat of the ruthlessness of French art, but that acknowledged, his themes are selected with a keen perception of dramatic point, and of the capabilities of the painter's art. They are, after their kind, excellent subjects. It is evident that De la Roche not only paints but thinks.

Amicus.—And I must say, the French artists as a body seem to be more alive to the importance of *subject* than we are here. The stories they choose are assuredly not always those that we should select, but they *are* stories—they tell something—whereas it is more common with our artists, than with theirs (I think), to be satisfied with a something that will make only a picture, superficially—which stops at the eye—at the portal—and claims no admission to the master of the house—the mind.

Magister.—And any one acquainted with exhibitions for the last twenty years, must have noticed how apt our artists are, as to subjects, to run in flocks. One person finds a mine, and more rush to it than it can accommodate. As at the diggings, when some keen explorer has found a precious nugget, crowds fly off to participate in his gains.

Amicus.—And when all the nuggets are gone, and but siftings remain, the earth is washed over and over, till the grains get very small indeed!

Magister.—And hardly worth picking up. A notable instance of this was the number of paintings we had at one time from the "Vicar of Wakefield." A remarkable picture or two was produced from this exquisite tale of English domestic life; and forthwith every one rushed to good Dr. Primrose's parish, as to a new spa! and we had Moseses, and Olivias, and Sophias, and Mr. Burchells, till one was quite weary of them! The Wakefield fever continued in great force for many years, and even now is hardly extinct. However, by this, I do not mean, by any means, to cast any slur upon any of the

really charming pictures that have been suggested by Goldsmith's work—but only to regret that, while so many precious fields of subject and suggestion lie around unexplored, that our artists should choose to follow each other as closely as on a sheep track, and risk giving a first impression of satiety to the Art-lover, by being so gregarious in their search for pasture.

Amicus.—There seems to me more to be said in the way of excuse for this, as respects the "Vicar of Wakefield," than in most cases; inasmuch as the amount of good instruction, kindly feeling, unaffected piety, moral, and variety of scenes of English country life, as fresh as the name of the family itself presented by that novel, is without rival in any work of fiction. However, if the painters are bad enough in this respect, what are the sculptors;—for ever a nymph preparing for the bath, or a nymph coming out of a bath! as if these handsome young ladies had nothing to do but to wash themselves!

Magister.—And this while such a wealth of female characters is offered on every side by the historian and poet. This is a point that illustrates how few people really think for themselves, or how much people are obliged to others for thinking for them, whichever way you put it. Our old subjects are, however, I suppose, new to the French; so, perhaps, there may be a good many among their subjects which appear new to us, which are hackneyed to them; so we must not emphasise the discrepancy of the two nations too strongly; and, after all, it is more important to have a subject good than new: for an old subject may be made a new one by original treatment; but a bad subject cannot be made as good as a good one by any excellence of execution:—at best, then, it is a struggle of elements; *while with a good subject you have wind and tide with you.*

Amicus.—What a noble field for the display of the highest qualities of Art is taken by Couture in his great picture which was in the centre saloon of the Beaux Arts Exhibition.—The "Decadence of the Roman Empire" I think it was called. On the whole no picture in the French portion struck me so much, or so fully came up to my idea of a grand work. A theme for all time! The moral essence of Gibbon's "Decline and Fall of the Roman Empire" presented at a glance! Resting on no individual historic fact—although a fact—but its interest bound up in man's good and evil nature; poetic, philosophic, epic in its highest sense—presenting, in awful warning, the causes that sapped the mighty Roman strength, the fungus of evil and luxury that eat away its pith and core.—The scene rises up before me.—Stretched on couches round the board in a gorgeous hall, are grouped the imperial Romans with the most exquisite forms of womankind. Steeped in orgies they conduct their carnival, and mingle love, wine, feast, music and thoughtlessness in one unholy wreath. Here the gay reveller clasps at his fair companion, nothing loth. There she fills for him his overflowing cup, and binds his brow with scented flowers. There the thoughtless laugh, the gay, the impious jest, wreathes the young lip, crimsoned with the blood of the grape, and welcomed by long eyes floating in indolence and love. Wine—more wine is brought, with fruit, by the laden attendants, while the voluptuary lolls overcharged with feast, and the faded flowers droop from the brow of the sated reveller, across whose racked brain the scene seems to swim and totter.—While from above—the marble statues of the ancient Romans that surround the hall appear to frown in sorrow down from their stone brows on the sybaritic scene of weakness and luxury that points with prophetic hand to the extinction of their country!—There—that is pretty well for one breath, is it not? but words will not describe a picture—at least mine can't. I think old Fuseli was about as good a hand at describing pictures as I know, especially when he was on his own ground—Michael Angelo. His words sometimes make the great Florentine's works glow before one, but it is given to very few to do this. I should think Eugene Sue could if he were to try—

perhaps he has done so, only I have not seen it—describe a picture as well as any one. For really he has the wonderful power to make us feel more by his description than if we were actually witness of what he describes. I recollect reading an account, I think it is in his "Juif Errant," of a black panther killing a white horse in a caravan;—He gives it with such extraordinary power, that I am sure I felt more horror in reading his description than I should had I really been present at the death of the poor brute.

Magister.—It is often a grief that the tendency of his works is what it is, for his powers of description are magical, and of dialogue, too. The French, who would not object to him on the score we do, hardly appear aware of the genius they possess in him, and even prefer to him those inferior spirits who possess only, in degree, those powers which make him so Samson-like in power. And as regards this picture of Couture's, the same thing may be said. Our neighbours do not seem to me to appreciate it high enough, nor to be aware of the treasure they possess in it. I agree with you, it is an admirable example of the power of subject, and that its moral renders it a work for all times. Its subject is thus the foundation of its excellence. The largeness of its theme inspired the artist throughout—gave wings to his power, and held him aloft above the usual level of Art: for it is excellent at all points. Its conception and composition are large, clear, well presented, and perfect in their adaptation to the painter's art. Had it not these qualities, it still would be admirable for the grace and drawing of the individual figures: and had it not the grace nor drawing, it would still remain a marvel of excellence of colour, and effect of light and shade.

Amicus.—I have heard it remarked that its general effect and colour reminds one of Paul Veronese's "Marriage at Cana."

Magister.—Perhaps:—and they are both feasts. That only shows, however, that its colouring is good.

Amicus.—I noticed bits in it wonderfully like Etty.

Magister.—Praise again! For there have been few masters of colour equal to our countryman. His "Eve before the Flood" is a bouquet of the most exquisite and well-arranged gorgeous flowers, and yet as true as Nature's self.

Amicus.—There was one figure especially like Etty; a female in the background with her hands up, behind a recumbent figure on the left-hand side representing Vitellius, dashed in and left half finished, as it were, yet giving the impression of finish, exactly after the fashion of some of the secondary figures in Etty's pictures.

Magister.—I recollect. With an ivory-like complexion. Etty's best flesh—was like flesh so beautiful that it was just like ivory.

Amicus.—Like Pelops' shoulder?

Magister.—The poetry of flesh, so firm, so pure, so polished, so delicate, and yet so vital!

Amicus.—I heard, while in Paris, that Couture had a pendant to this great picture—one representing the decadence of France—then in his studio.

Magister.—And how represented?

Amicus.—Oh, a gorgeous masquerade of French life and character—very severe and very sybaritic! but I only say what I heard. There was a quality in the picture that we have been speaking of that struck me as unusual—at least in degree—and yet not in the least stiff, and that was its ornamental arrangement and balance of parts. In the exact centre of the picture there was a group of forms made by, I think, the statue of Cato, and a male arm holding a cup, and a female's pressing grape-juice into it, which being, as it were, the text of the whole tableau, was at the same time its centre boss.

Magister.—And that is praise again; for a picture or a statue is none the worse, as a work of high Art, but the better for being essentially a work of decoration too. In many of the finest works this decorative element is evident; and a consequent degree of uniformity and balance, not, however, obtrusive. The works of Raphael, Angelo, and Fra Bartolomeo, and fine Italian art in general afford many instances of

this. And in the sister-art the Venus de Medici has acquired much of her fame by being, as regards general arrangement, a piece of ornament. This renders it decorative on its pedestal wherever it is placed. The same with the group of the Cupid and Psyche, which presents a perfect vase form. The view of Painting and Sculpture that does not comprise ornament, or take it into consideration, is assuredly not complete. Paintings and sculptures are the highest kind of decorations, as men and women are the highest kind of animals—gifted with reason, if you like, instead of instinct—and with moral and intellectual attributes, in place of those of mere sensation; but still their structure in their material parts are on the same principles; and it is the small view of Art, and not the large one, that overlooks this. In this respect our European neighbours—French, German, and Italian—have all the advantage of us. With them pictures and sculptures are not looked at in so isolated a manner as they are here. There appears rather an unwillingness here among the followers of the two most intellectual branches to a claim of kindred being made by decoration, decoration being somewhat regarded by our painting and sculpture in the light of a poor relation, and hardly to be owned.

Amicus.—Like what Charles Lamb said of the monkeys!

Magister.—And the general public, and even Art-lovers, have much the same ideas; for although the number of collections of paintings are on the increase here, you often find them in the plainest possible houses, where you would not expect such treasures. While, on the other hand, with the French, you find all the kindred of Art more associated, and the higher branches relied on but in part for the attraction of their apartments. It is astonishing what the Parisians lavish on these occasionally.

Amicus.—Yes, I forget what Madame ——— told me she had spent upon her boudoir, but something enormous.

A NOVELTY IN FANCY-WORK.

A YEAR has now elapsed since the publication in the *Art-Journal* of a series of articles "ON DESIGN AS APPLIED TO LADIES'-WORK."* On resuming the subject the following questions naturally suggest themselves, namely: Have the papers been productive of good? To what extent have the designs furnished by the shops improved in their ornamental character? and, Has the taste of those for whose benefit the designs are made been equally progressive? The answer to all these questions will, it is believed, be satisfactory; and it must be gratifying to the Editor of this Journal to reflect that not a little of the improvement in the public taste may be attributed to his increasing exertions, which now extend over a period of nearly eighteen years.

Although Fancy-work can never aspire to the dignity of a fine art, yet, the beauty and variety of which it is susceptible, the universality of its application, and its adaptability as an employment for the leisure hours of the affluent and easy classes, will always render it one of the most important of the Industrial Arts. Between the fine Arts and those of industry, there appears to be the following grand distinction. The former depend for their effect and value chiefly upon design, to which the technical execution is entirely subservient, hence the estimation in which each individual work is held as the single production of genius. The latter, on the contrary, are valued for the mechanical dexterity with which they are executed, and the frequent repetition of a favourite design is considered no deterioration of its value. In the one, the artist is identified with the *originality* of the design, and on this ground rests his claim to distinction; in the latter the workmanship is too frequently admired, while the very name of the designer is forgotten, even if any person were curious enough to inquire it. With needle-work, espe-

cially such as is practised by ladies, it is to be feared this will ever be the case; the pleasure of executing the work is the object they have in view; few will take the trouble to make designs which they can purchase for a trifle. Some few may acquire such a knowledge of the principles of design as may enable them to select good patterns, and in this we have endeavoured to assist them; but by far the greater part of the lady-workers will be content to take what is offered them at the shops, or make their selection independently of any governing principles of taste. They seek pleasure, not toil, in their fancy-work, and are content to follow it with as little labour as possible.

Under these circumstances it is gratifying to remark a general improvement in the character of the ornamental designs exhibited in the shops, and also in some contemporary publications. This progressive improvement is especially perceptible in the designs for fancy-work published weekly in the *Lady's Newspaper*. This paper is the only one which has adopted, and with apparent success, the plan of expressing colour by a variation in the strokes produced by the graver. It were much to be desired that this practice should become general in ornamental designs. Were it always adopted for designs intended to be coloured, it would not only obviate the expense of coloured engravings, but it would be scarcely possible for the copies in needle-work to exhibit inharmonious arrangements of colour, unless the copies themselves should be defective in this respect.

The greatest improvement, however, which has yet taken place in designs intended for ladies'-work, is that which has been patented by Mr. George Curling Hope, of Hastings, for braid-work. But, before entering into a description of his "Patent Impérial Appliqué," it will be necessary, in order to appreciate his improvement, to make some preliminary observations on the description of fancy-work to which it is adapted.

Braid-work, as usually executed, consists, as our lady-readers are aware, in tracing the outline of a design with narrow braid, which thus constitutes the only ornament. Running patterns are usually selected for this work in order to avoid the inconvenience of frequently cutting and joining the braid. The design of the border as represented in the lighter part of the scroll wood-cut, answers this requisition; but, it may be asked, is the design satisfactory, and in what respects could it be amended? The grand defect is, that the design is not sufficiently apparent to the eye, for it is not otherwise distinguished from the ground than by the narrow edging of braid, which although only the *outline* of the pattern, really appears to constitute the *whole* of it. Designs, as I have before remarked,* should be varied from their grounds either by texture, by colour, or by light and shade. Now, in the above cut the ground and the pattern are exactly alike, and the eye cannot follow out the design without considerable effort, and even then the effect is unsatisfactory. Nor is this an extreme case; I have examined many patterns for braid-work, and found them deficient in this respect, and not unfrequently imperfect in their outline from the endeavour to avoid cutting the braid.

The only designs adapted for braid-work on a

* Inserted in vol. vii. of New Series, for the year 1854.

* See remarks on this subject in vol. vii. of New Series, pp. 74, 75, 136, 137.

plain ground of one colour are "strap-work," or geometrical tracery, or scrolls, which require no filling up, and in which the requisite continuity of outline is obtained, without departing from the braid-like character, which ought to be a continuous design of unvarying width.

Referring once more to the wood-cut, let the reader try the simple experiment of filling either the ground or the pattern with a darker tint; the design will immediately become distinct, and a more satisfactory result will be obtained. If a white outline be preserved, the effect will be still better. But, it may be asked, how is this effect to be produced on the actual work; it looks well on paper, but how is it to be carried out in practice? It would be easy to vary a lace ground by a pattern in muslin, the outline being over-cast or sewn, like that old point-lace; or to make the pattern in open stitch, on a muslin ground; but, although a design in satin on a merinos ground, or of velvet on a cloth ground, would look extremely well edged with braid, it would not be easy to execute such a design, so as to preserve the sharpness of the contour, and avoid ragged clumsy edges. I have, however, seen a very rich effect produced by forming a design of coloured flowers and green leaves of coloured satin, on a ground of claret-coloured merinos. The difficulty of the work would, however, prevent its becoming general.

By the invention of Mr. G. C. Hope, the difficulties and defects above alluded to are obviated. Instead of applying the braid upon cloth or other textile fabric of an unvaried colour, in the "Patent Impérial Appliqué"—for this is the name given to it by Mr. Hope—the design round which the braid is to run is produced in a different colour from the cloth forming the ground; thus producing the same effect as has hitherto been attainable only by cutting out figures from another coloured cloth, and laying them on the ground, a process which necessitates the consumption of a double quantity of cloth. This, as I have before observed, is also very inconvenient to work, from the edge of the figure rising above the ground.

The darker part of the border pattern is intended to show the effect of the same design when produced in a colour or shade different from the ground, and edged with coloured silk braid, or gold or silver twist.

The invention is a very happy one, and will not only be a great improvement upon braid-work generally, but will, if I am not mistaken, induce towards establishing a better taste in design, and a more harmonious arrangement of colours. The colours being applied to the cloth by the patentee, are more likely to be harmonious when selected by a person who has studied design than when chosen according to the fancy of the person working it. As the variation in the colour is obtained by printing one colour upon another, there are some few difficulties of a chemical nature to be overcome. Time will probably remove these. Among some of the combinations of colour which are at present ready are scarlet

on black or claret; green, on dark green, black, or claret; blue on black; white on scarlet, blue, or marine; white grounds with two or three coloured figures.

The braid should generally be of a neutral colour, gold, silver, black, white, maize, &c. Every one who has studied the beautiful effect of Indian embroidery and decoration, must have perceived how much of the richness of the

No. 1.—BRAIDING AS USUALLY DONE.

design is produced by the decided outline which always surrounds the figures when the ground is of a contrasting colour.* The English embroiderers of the middle ages, who were very celebrated for their skill, always surrounded the flowers which were embroidered for the decoration of rich ecclesiastical vestments, with a raised edge of gold twist. The moderns cannot

No. 2.—PATENT IMPÉRIAL APPLIQUÉ.

do better than follow such good examples. It is only necessary to see some specimens of Mr. Hope's "Patent Impérial Appliqué," to be convinced not only that it is infinitely preferable to the common kind of braid-work, but that it is capable of producing very rich effects.

The circular wood-cut underneath is intended

as another illustration of the superiority of Mr. Hope's process over that now in use: we submit the matter to the judgment of our lady-readers especially.

* The reader is referred for some remarks on this subject to the before-mentioned articles in the *Art-Journal* for the year 1855, pp. 136, 137.

THE ROYAL PICTURES.

AMALFI: GULF OF SALERNO.

G. E. Hering, Painter. E. Goodall, Engraver.
Size of the Picture, 2 ft. 10 in. diameter.

THE painter of this picture, like many other men, began life in a far different course from that which nature evidently intended him to pursue. He was engaged in a banking-house, where he busied himself more with sketching in blotting-books, than in attending to balance-sheets and ledgers. His family, seeing the inutility of keeping him to an employment so little suited to his tastes, allowed him to follow his own inclination, and sent him to study painting at Munich; subsequently Mr. Hering visited Italy, Hungary, and the East, returning to England after an absence of seven years.

Italy is the land with which the pictures of this artist are, without a single exception, identified; the first work he sent to the Royal Academy was in 1836, when he exhibited the "Ruins of the Palace of the Cæsars at Rome," and from that year to the present, the annual exhibitions of the Academy and the British Institution have seldom, if ever, opened without one or more specimens of his chaste and elegant pencil; for these terms, perhaps, express his style better than any other. It was, however, some time ere his pictures got so placed on the walls of the exhibition-rooms as to afford a fair opportunity of judging of their merits; he was indebted to the poet Rogers for first bringing him into notice, and it was with reference to this picture of "Amalfi." The work was painted in 1841, and sent to the British Institution, of which Mr. Rogers was then a director. Going to the Gallery one day, prior to the pictures being hung, he made inquiry after the painting sent in by Hering, who had a short time previously been introduced to him, and, finding it worthy of a good position, caused it to be well placed. The result of the poet's judgment and kindness was the purchase of the picture by his Royal Highness Prince Albert. Mr. Hering always speaks in terms of grateful acknowledgment of Mr. Rogers's act, as the first step towards his future success: he had never before sold a picture out of an exhibition-room. His works are now among the best illustrations of Italian landscape-scenery that grace our public galleries.

Amalfi is a small town in the kingdom of Naples, and is built on the steep declivity of a mountain, which overlooks the Gulf of Salerno. The artist's poet-friend thus refers to it:—

"He who sets sail from Naples, when the wind
Blooms fragrance from Posilipo, may soon,
Crossing from side to side that beautiful lake,
Land underneath the elms where once, among
The children gathering shells along the shore,
One laughed and played, unconscious of his fate; *

* There would I linger—then go forth again;
And he who steers due east, doubling the cape,
Discovers in a cove of the rock
The fishing-town AMALFI. Haply there
A heaving bark, an anchor on the strand,
May tell him what it is; but what it was
Cannot be told so soon."

This little fishing-town—for it is nothing more now—was once a large commercial port, renowned for its trade with Egypt and the East. The whole region round about the bay of Salerno is one of great interest, not alone for its picturesque beauty, but because it was the favourite haunt of some of the great painters of past years—Gnido and Domenichino, Spagnoletto, Caravaggio, and Lanfranc; and since their time few artists visit Italy without including it in their travels.

Mr. Hering's picture shows but little of the town. He has taken his sketch from an elevated point overlooking the bay, while an exceedingly picturesque arch of red brick offers a striking fore-ground feature; the effect is that of a tranquil mid-day, somewhat cool. The artist has caught the true spirit of the Italian landscape—that air of listless luxuriance that pervades both the scenery and the people of Italy.

This picture, which is painted with great tenderness and transparency of colour, is in the collection at Osborne.

* Tasso.

AMALFI
FROM THE PICTURES OF THE PAST COLLECTION

BRITISH ARTISTS: THEIR STYLE AND CHARACTER.

WITH ENGRAVED ILLUSTRATIONS.

No. XIV.—THOMAS CRESWICK, R.A.

ENGLAND is, of all countries, that in which landscape-painting has reached the highest point of excellence, and where it meets with the most liberal encouragement; and, perhaps, in the latter fact, we may find the cause of the former, inasmuch as a demand usually produces a supply. Nor would it be difficult to assign a reason why this class of Art is so generally esteemed among us: the English are proverbially lovers of the country—of its scenery, its occupations, its amusements, its retirement and quietude. The nobleman or the untitled landed proprietor, whose estates have been handed down through successive generations, exults in his broad acres as his eye surveys park and pasture, woods and bending corn-fields; and, while he feels they are the sources whence his wealth is procured, and his position in society maintained, he admires the beauty of the landscape—he plants and cuts down, he opens out views and closes up spaces, to aid Nature in forming the picturesque. The merchant and the prosperous tradesman, unlike those of most continental cities, leave the mart, the counting-house, and the shop, when the labours of the day are over, for their suburban villa, with its neatly-trimmed lawn and well-stocked garden, and half-a-dozen acres of grass, perhaps, for the cow and the poultry; and these become aids to the enjoyment of real rural life. And, descending to a yet lower scale of society, the mechanic, whose mind has not become vitiated, and his senses dulled by the gin-shop—the great curse of England—finds relief from his ceaseless toil, on the few holidays that fall to his lot during the year, in wandering with his wife and little ones into some remote outskirt of the city or town wherein he dwells, that they may breathe the air of scented flowers, and refresh their eyes with the verdure of the green fields. “The architecture of castles and palaces,” says an American

writer, “the statues of local divinities, the designs of escutcheons and sepulchral monuments, address the feelings both of love and pride which bind generations of men together;” but there is something which addresses the feelings, and invites the admiration of every human being—though its voice speaks more eloquently and persuasively to some than to others—and that is Nature, in her grandeur and her simplicity, in her tempests and her calm. In such contemplation the peer and the peasant, the lettered and the ignorant, stand on equal ground; science, philosophy, education, a cultivated taste, are needless, as they are inoperative, to create a love of the beautiful, or for its appreciation. A man can no more shut his heart against its influences than he can effectually seal up his eyes to the brightness of the meridian sun; and though he may be unable to explain how he is affected by the light of the one and the magnificence of the other, he feels his sensibilities awakened, and is glad.

We are not among the number of those who regard landscape-painting as an Art requiring little mental capacity, nor even as one of a comparatively inferior character. The eye that is ever resting on the amplitude and the glory of the works of a Divine Maker—the imagination that is filled with their beauty and their power, receives what must expand and elevate the mind. Can that be an inferior Art which portrays the thunderstorm as it echoes from peak to peak of Alpine mountain, till every living creature is awed by its terrible majesty—that paints the sun as he wakes up a world from its slumbers, or decks it with a “robe of molten gold” as he sinks in the western horizon—that brings before our eyes the rushing of the cataract, or the murmur of the rivulet, so that we fancy our ears catch the rippling of the one and the roar of the other—that leads us beside pastures of living green, or into the cool recesses of the shady woods—that shows us the husbandman binding his sheaves, or dotting the meadow with tiny mounds of newly-mown grass? Is that an Art of inferior degree which compels the closest studies of the subtilties and the delicacies of Nature in her ever-changing moods, her infinite varieties of material, and her operations; which requires a certain amount of botanical knowledge to delineate the forms and the anatomy of trees and plants; of the science of geology, with reference to the shape and colour of rocks and other irregular masses; of so much of meteorology as to understand the laws that regulate the action of the sun with reference to light and shade, the motion of the clouds, and atmospheric appearances; and of chemistry, with regard to the uses and properties of colours? We do not say that every good landscape-painter has all this knowledge in himself, so as to be able to give a ride for whatever he does; but he must possess a practical knowledge—though he may be partially ignorant of theories—or he will never become a faithful

THE ENTRANCE TO THE COVER.

[J. & G. P. Nicholls.

copyist of Nature: and if landscape-painting requires so many varied attainments, each being in itself of a high character, such an Art must not be lightly spoken of, as one of secondary degree. We doubt much whether any class of Art offers to those who practice it so much real enjoyment, for, whether sketching in the fields, or working in the solitude of the studio, they are always surrounded by the beautiful; like the children of Israel, when thick darkness overspread the land of Egypt, they have ever “light in their dwellings.”

The name of the artist to whose works we now propose to introduce our readers is closely identified with our school of landscape-painters. His biography may be written in a few lines: the story of his life is on his canvases. Mr. Creswick was born at Sheffield, in 1811; of his lineage and his first essays in Art we know little; but we believe that he acquired some knowledge of painting in Birmingham. However this may be, he soon found his way to London; for in 1828 he had taken up his abode in the neighbourhood of St. Pancras, and

exhibited two pictures in the Royal Academy, one of which attracted our attention especially, for on turning to our Catalogue of that year, we find a mark of approval against "No. 37. Llyn Gwynant, North Wales—Morning, T. Creswick." As the works of a young artist, especially if he be a landscape-painter, admit of little else than a kind of general criticism, we briefly pass over the first few years of Mr. Creswick's appearance before the public, with the remark that he became a regular contributor both to the British Institution and the Royal Academy, each successive year bearing witness to his industry, his progress, and his popularity. Looking over our piles of catalogues of this period, we see a commendatory note against many of his pictures, the scenes of which are laid chiefly in North Wales, Yorkshire, Lancashire, and the adjacent counties.

In 1836, Mr. Creswick removed to Bayswater, where he still resides, and where he had as a neighbour another of our distinguished landscape-painters, the late Sir A. W. Calcott, R.A. He must have visited Ireland about this time; for some of his exhibited pictures were

views taken in that country, such as "Blackrock Castle, Cove of Cork;" "Glengariff, County Cork." We have, however, rather an indistinct recollection of a picture painted in 1838, of a very different character from these; it was called "The Wayside Inn—Market-day," a cleverly-painted composition, representing one of those picturesque incidents of rural life which this age of iron horses has almost driven off the road.

Calcott and Collins were at this period the two artists whose delineations of English scenery were held in the highest respect; yet it was quite evident there was another rapidly advancing, not to push them from their thrones, but to share in the honours they had acquired. Creswick, however, was no copyist of either; he followed Nature alone, and so closely, that in many of his early pictures there is such an undue preponderance of the vivid green peculiar to our trees and herbage, as to be painful to the eye on canvas, however welcome it is in the real landscape. There was also some apprehension in the minds of those who were watching

THE HAWKING PARTY.

his progress, that the delicacy of touch and attention to detail which his works showed would degenerate into prettiness—an error that a painter finds difficulty in amending if it once becomes a practice. But the pictures he exhibited in 1841—five at the British Institution, and three at the Royal Academy—entirely removed whatever apprehension existed: he seems all at once to have struck into a new path, one uniting vigour and boldness of handling with delicacy, and greater variety and harmony of tints with the fresh verdure of Nature. Two of the pictures of this year may be singled out as decided examples of improvement. "A Road Scene" (British Institution), into which a blacksmith's shop is introduced; and "A Rocky Stream" (Royal Academy): these are both most vigorously touched. The former is an evening scene; the dim light of closing day is very skilfully managed, and the reflection of the blacksmith's fire on the adjacent trees is perfectly illusive. The "Rocky Stream" is a small picture, but—our readers must pardon an unintentional pun—it is a gem of the purest water, boldly and vigorously painted, the strength happily mixed with delicacy.

The "reign" of Mr. Creswick may be dated from 1842, when he exhibited two pictures at the British Institution—"Afternoon" and "June"—which surpassed all previous efforts. These were followed, at the Royal Academy, the same year, by three others, concerning one of which, "The Course of the Greta through Brignall Wood," we expressed the following opinion:—"The subject of the picture is a bower of greenwood, woven by Nature over the course of the Greta, amid the rocks and stones of which struggles a shrunken thread of water. The foliage is painted with the accustomed excellence of this artist, and a portion of it conveys perfectly the effect of the light of the sun breaking without the screen of leaves. It would be difficult to exaggerate in praising the works of this accomplished artist. He paints *facts*; at least, he always seems to do so, for his works are full of what appears strict truth; and, at the same time, he always contrives to make a poem of a picture, no matter how insignificant may be the scene: a solitary tree, a lichen-covered rock, a bubbling rivulet, become most graceful when touched by his almost magic

pencil." In the autumn of this year he was elected an Associate of the Royal Academy.

It would be vain to attempt—and, indeed, it is altogether unnecessary—to give a *catalogue raisonnée*, in our limited space, of the works of so productive a painter as Mr. Creswick, we shall, therefore, only just note down a few of his pictures, the recollection of which has not yet left our memory. Where an artist, as he has done, adheres so closely to one range of subject-matter, and with very little alteration of treatment, it is difficult to avoid sameness of description. Welsh glens and mountain-streams, skirts of forests and avenues of lofty elms, luxuriant valleys and winding rivers, however variedly disposed in Nature or in Art, are not the materials on which to comment without hazard of

repetition and monotony; hence the landscape-painter taxes the ingenuity of his critic or biographer far more than the painter of historical or *genre* subjects.

A "Welsh Glen" (Royal Academy, 1843) is a picture that those who have once seen it will not soon forget. It is a bright summer's-day, but the stream, flowing down between lofty perpendicular rocks, crowned with thick foliage, is in deep shadow, presenting to the eye a solitude of exceeding beauty and solemnity, *nullo penetrabilis astro*, for the only ray of sunshine that lights it up falls on the crest of the rocks and on the trees. The "Mountain Torrent" (Royal Academy, 1844) is a highly poetical treatment of a similar kind of subject. The scene lies, we should think, in Scotland, the rocks being bolder and more rugged than those generally found in Wales, and the torrent broader

THE PLEASANT WAY HOME.

[J. & G. P. Nicholls.

and wilder in its impetuous rushings: the tumultuous dashing of the water is finely expressed in this work.

In the British Institution, in 1845, was a picture, not very large in dimensions, which was rather a novelty from the hand of this painter; the subject was an Old Water-mill; so venerable it seemed, that the oldest inhabitant of the parish in which it then stood could scarcely remember to have heard the clicking of the wheel, decayed and worn out. Every item in this work is painted with exceeding fidelity, yet it leaves an unpleasant impression on the mind by its truth; it suggests a thought of bankruptcy, ruin, and distress. In the same room, and at the same time, hung another work, totally different from all previous—and, so far as we recollect, from all subsequent—pictures by Mr.

Creswick, a passage of Alpine Scenery, painted, we presume, from a sketch by some other hand, for we do not remember to have heard that he has ever travelled into the country of the Alps; at all events he has never, we believe, made it the subject of his pencil except in this instance. The picture is painted with great power and feeling, but we prefer the artist in England. Of five pictures exhibited at the Royal Academy this year, two especially deserve to be pointed out for their picturesque composition and freshness of colour—"The River in the Glen," and "Rain on the Hills;" it is impossible to imagine any landscape scenery more beautifully painted than are these subjects.

Have any of our readers ever journeyed into the Weald of Kent in the autumn of the year? if so, they must have witnessed such a sight as no other country

in the world—and we may add, if we consider the general aspect of the landscape, no other county in England—can furnish: a vast range of hop-gardens, over which the eye traverses till it meets the horizon, or rests upon the thick masses of foliage of some distant wood; the tract itself relieved from monotony by noble oaks and elms, that frequently serve to shelter the plants from unfavourable breezes. The vineyards of southern Europe can show no scenery more picturesque and luxuriant than these gardens, which Mr. Creswick made the subject of a charming painting, exhibited at the British Institution in 1846. The peculiarity of the subject required, on the part of the artist, much patient labour, united with taste and skill, in the management of materials possessing great uniformity of character; these qualities are quite apparent in his picture. "Haddon Hall" has been a favourite spot with this artist; he has frequently painted it from different points of sight; one of his most interesting views to us, was that exhibited in the Academy in 1846, representing the well-known flight of steps leading from the garden to the terrace, with the ancient yew-trees and spreading elms: the subject is treated with great originality, but with unaffected truth. "The Valley," exhibited at the same time, is a well-remembered picture: a large open landscape, taking in an extensive and varied range of country, the whole lit up—except the immediate foreground, which is in shadow—with the most glorious sunshine. Another contribution of this year, "THE PLEASANT WAY HOME," engraved on the previous page, is a scene to cause envy in those who, like ourselves, are compelled to trace their way

home through lines of bricks and mortar, instead of such a noble avenue of green leaves, dancing to the music of the summer's breeze, as we see here.

There was a picture exhibited by this artist at the Academy, in 1847, which bore the simple, yet comprehensive, title of "England;" and certainly our rich and verdant landscape was never more exquisitely represented than in this work, the largest we recollect from his pencil; it is, we imagine, a composition, not a sketch from Nature; but England boasts many such scenes,—a wide expanse of country, corn-fields, and pastures well watered, homesteads, and distant spires that mark the spots where

"The rude forefathers of the hamlet sleep."

This picture ought, on every account, to have found a place in our National Gallery. Indeed, this painter never at any former period came out in such power and general excellence; while we are quite sure he has never surpassed his productions of 1847, an *annus mirabilis* with him: let those who can, recall to mind his "Doubtful Weather," and "The London Road a Hundred Years ago," to prove the truth of our assertion. How magically the light plays over the barren heath in the former picture, and how charmingly it alternates with the broad transparent shadows!—in the latter, the landscape is not only rendered with the most poetical feeling, but there is in the composition a group of figures introduced such as we have never seen from his hand: whoever owns one of these three works, possesses a treasure of Art he cannot value too highly.

SPRING-TIME.

[J. & G. P. Nicholls.

Among the five pictures contributed to the Academy Exhibition the following year, we remember one that, had Collins been living at the time, we should have ascribed to him, both on account of the subject and the treatment. A coast-scene was a perfect novelty from the pencil of Creswick, yet in his "Home by the Sands" we have a work as truthfully and skilfully painted as if he had all his lifetime been accustomed to study by the sea-shore, in place of glens, woodlands, and

"Rivers by whose falls,
Melodious birds sing madrigals."

The sands are traversed by groups of country-people returning from market with their purchases, in carts, in baskets, &c.; the tide has ebbed out, leaving here and there pools of shallow water which reflect the evening sun; the whole shows most careful and accurate study of Nature. There was also another sea-side scene exhibited at the same time, called "A Squally Day;" it pleased us far less than the other, though the intent of the artist is carried out with unquestionable ability.

In 1850 the name of Mr. Ansdell appeared, in conjunction with that of Mr. Creswick, against a picture exhibited at the British Institution, under the title of "Southdowns;" the "Downs" or landscape being, of course, painted by the latter, and the "Southdowns," or sheep, by the former. Each did his part marvellously well; so well, indeed, as to induce them to work together again at various subsequent times,—just as Mr. F. R. Lee and Mr. T. S. Cooper are accustomed to do. The "Wind on Shore," an Academy picture of the same year, gave another proof of the talent of Mr. Creswick in depicting coast-

scenery; it would be hard to say whether in such subjects, or in those with which his name is more frequently connected, he shows greater excellence. He was elected Academician at the end of this year; and here we must conclude our reference to particular pictures, which we have selected almost at random from those that are most vivid in our "mind's eye."

We have spoken of the year 1847 as Mr. Creswick's great year; a few, perhaps, of his subsequent pictures will bear comparison with it, but certainly not those which have appeared during the last three or four years. If he has not fallen into the "sear and yellow leaf," he has adopted a low and dingy scale of colouring, which, in a very short period comparatively, must place them on a level with the smoke-dried old masters that are now rarely to be found but in the shop of the broker. This practice is not new to him; it was tried once before for a season or two, but he had the wisdom to perceive his error and to amend it; let us hope he will do so again. Humanly speaking, many years of active labour are before him; the pastures of Old England are as green as ever; her forests and her dingles have lost none of their bright verdure; her mountain-streams and rivulets still flow joyously and sparklingly: the eye of the painter cannot surely be blind to this; why then should he try to tempt us into the belief that Ichabod is written on the forehead of our land, or that he himself cannot see as he once saw? Though we have many other excellent landscape-painters, whose works always afford us exceeding pleasure to contemplate, we are most unwilling to have our admiration of Mr. Creswick lessened—we do not mean by comparison with others, but with himself: of late, such comparison is certainly unfavourable to him.

A NEW PLEASURE. THE MARINE AQUARIUM.

BY MRS. S. C. HALL.

"'Tis said that Xerxes offered a reward
To those who could invent him a new pleasure."
BYRON.

HAPPY are they who to admiration of the beauties of nature—inseparable from a feeling and reflective mind—add a knowledge of the causes and effects of what the Giver of all Good has so abundantly scattered, not only over the face of earth, but underneath the waters. Yet so universal are the wonders of creation that those who go "abroad in ships" do not encounter greater marvels than are to be met with in standing pools, or mingling with the murmurs of tiny rivulets "at home." To the lover and observer of Nature nothing is barren, nothing "common or unclean": the blade of grass, the drop of water, the sparkling pebble, the stiff clay, the teeming mould, the rocky fragment, the glittering sand, the whispering shell, the bursting bud of the wayside flower, the penetrating sunbeam, the pale ray of the queenly moon, the crystal salt in the chasm to which the wave seldom returns—all are suggestive of thought, and all may be sources of enjoyment—while all, insignificant as they seem, are essential parts of a mighty whole.

In the bright summer or cooler months of autumn, we who reside in London think it as much a duty as a pleasure to inhale the freshness of the country, and return from our rambles to our city homes laden with "specimens" of the material world, or flowers and ferns that will keep "green memories" amid the snows of winter; we enrich our "fern-houses" with tributes from our Glens or Highlands, and few things cheer us more than the remembrance of how the little plant was obtained, and who assisted in the gathering. Dried leaves have too much of death about them to convey unalloyed pleasure to the living, and we consider "Ward's cases" to be acquisitions for which all town dwellers are bound to hold the inventor in high esteem—the living memory of many a mountain ramble is enshrined in a "Ward's case," or even beneath a simple bell-glass. But we Islanders are too fond of the element to which we owe our safety as well as our restraint, not to seek its shores, if we cannot cross its waves; and until lately the only mementos we could bring away of the storm or quiet of the deep were dried "flowers of the sea," or beautiful shells, the least perishable of all the forms that enclose life: our own, alas, soon mingle with the dust to which they are doomed to return, while the dwelling of the periwinkle and the limpet seem to endure "for ever."

The "new pleasure" to which we invite our readers, has to do, not so much with the homes of the limpet and the periwinkle, as with the manners and customs of their inhabitants. We have become in some degree familiarised with the snail family, and understand their value in keeping the plants that flourish in our glass-bowl from being coated with "fur" or slime. We have advanced a good many steps in our treatment of gold fish; we no longer doom the little animal to an eternal swimming mill, without the relief of shade; we permit him to meander through groves of the delicate *Vallisneria*, and in the centre of his crystal palaces we build him a miniature Stonehenge, wherein he can play at hide-and-seek, and enjoy a cozy nap without disturbance, or even observation; we introduce to his habitation a tiny shoal of minnows—most frolic-loving things—which, when we tap the glass, flock to the surface and greedily devour the fragments of "pastry-cook wafer" which, though they never did banquet thereupon in their natural state, they much enjoy in their captivity. We have learned from Mr. Warrington to treat the tiny stickleback with as much respect as we were taught in childhood to bestow upon the beaver, and recommend our

young friends to purchase a miniature aquarium especially for them, and so have the pleasure of observing the care bestowed by father stickleback in the formation of his family mansion, and the parental attention he pays to the protection and education of his young masters and misses, whom he keeps from the jaws of devouring minnows. We understand all such creatures better than we did, and it may be they return the compliment.

Our own especial "new pleasure," however, is the MARINE AQUARIUM. Concerning this drawing-room "romance of nature," we borrow a pen better qualified than ours to deal with the object to be attained, *i. e.* the arrangement of a collection of animals and plants in salt water, in such a manner that, by the working out of natural laws, the whole may be permanently self-sustaining and self-purifying, without frequent change of the water being necessary.

"The circumstances which brought about the growing taste for such an agreeable adjunct to our homes as the Aquarium, were mainly some experiments on the domestication of marine life, commenced—almost simultaneously—about five or six years ago, by Mr. R. Warrington and Mr. P. H. Gosse.* Then came some popular, accurately written, and beautifully illustrated books on the subject, by Mr. Gosse, followed by the opening to the public, in the spring of 1853, of the large and magnificently appointed aquatic collection of the Zoological Society, in Regent's Park, London, which produced as important effects on the branches of natural history to which it relates, as did the previous great event of 1851, in Hyde Park, on the sciences at large.

"No sooner was it found possible thus to make daily acquaintance with the 'manners and customs' of a great variety of curious organisations previously hidden from all except professed naturalists, than many old notions on their natural history became exploded, and indeed it would be easy to name more than one accepted text-book, dozens of pages of which must be cancelled by the aquarium-experiences of the last four years. Of course the desire to have Aquaria at home became obvious. In fresh-water, it was an easy matter to plant aquatic vegetation among gravel at the bottom of a vase, and to put in fish and other animals; but the attempt to set up a *marine* collection and to maintain it in a healthy state, involved many difficulties. The supply of sea-water was uncertain and costly, and even when obtained, its purity, and that of the vessel in which it was brought from the coast, could not always be depended upon. In cases of accident, too, the whole of the live-stock might perish before a fresh importation of water could be made. At length Mr. Gosse stepped in with a formula for the manufacture of an *artificial sea water* from its constituent salts, which, after adequate trials, has been found nearly to answer every purpose of actual sea-water.†

"It then became necessary to obtain the animals and sea-weeds from the coast. This, to residents inland, was a matter of difficulty. Amateurs could not always find the time and means to visit the sea-side and collect for themselves. Nor was it always practicable to employ an agency for the purpose; to hire a man to procure and transmit so small a quantity of specimens as would merely suffice for a vase or tank, would obviously be working at a disadvantage both to collector and purchaser. In short, it became essential that some one in the metropolis should be found willing to 'set-up shop' in this kind of 'marine stores'; to establish a regular communication with the coast; to receive consignments at stated intervals; and to be willing to retail them in any quantities according to the variation of the tastes and means of purchasers."

This important object has been attained: and although we furnish in a note some information

* Mr. Gosse, writing in the "Magazine of Natural History," in Oct. 1852, states that "priority of publication is universally acknowledged to give a title to whatever honour attaches to a new discovery, and this I shall not dispute with Mr. Warrington."

† Previously, however, (in 1839) Dr. Schmitzer had made marine salts, for the formation of artificial sea-water, after his own analysis of the Channel water off Brighton.

for the guidance of our readers, we have no doubt there either are—or will be—in London as well as at the sea-side, many other ministers to the wants of purchasers.*

We commenced our salt-water "Aquarium" under the most favourable auspices. The accomplished secretary of the Zoological Society was so good as to order for us a tank of "suitable" dimensions, and permit one of his intelligent keepers of "marine stores" to arrange the interior of our mimic ocean; he also gave us the necessary quantity of sea water, "dipped up" from the Atlantic, and some excellent advice; but we furnished our tank as young house-keepers are apt to furnish a house—with much more than was necessary. Every specimen we could collect was floated into "the tank." We should not, during the days of our young experience, have hesitated to have introduced a juvenile shark or cod fish into our marine menagerie. It was in vain that the Hermit crabs gathered in their claws, that swimming crabs and other crabs crowded from the bottom, and endeavoured to reach the summit of the rocks to escape with life from the noxious gases generated by dying and sickly fish without a sufficient counteracting influence of marine plants; it was in vain that the pied *Crassicornis* bloomed and died within a day, that the *Actinia bellis* (the hardy daisy), refused to implant itself among our pebbles—that the *Sabellus* crept out of their cases, and the delicate *Actinia dianthus*, and even the hardy *Mesembryanthemum* let their tentacles droop in unhealthy inertness; still we continued adding instead of withdrawing, pouring in halfpints of innocent periwinkles, and half-dozens of springing shrimps, until in a few days the water became offensive, and the whole contents of "the tank" was obliged to be thrown away! We were "all in the wrong,"—and in addition to the information derived from the secretary of the Zoological Gardens, from the kind counsel of Mr. Gosse, as well as from his books, varied and beautiful as they are; from that also of Doctor Farre, who wrote concerning the interest of those sea-creatures some twenty years ago; in addition to our sea-side experience during the autumn, and our daily access to Mr. Heale's picturesque cottage at Ilfracombe, where, beneath a bower of roses and woodbine, his bright and pretty daughter has become as familiar with "*Madrepores*" and "*Sabellus*" and "*Actinie*" of all kinds, as the generality of village maidens are with primroses and buttercups; in addition to the inspirations of "Glaucus" and the concentrated wisdom of the pretty square books published by Mr. Reeve; though we waded ankle-deep at least in Watermouth Bay, and explored "tide-pools" and wide-spreading sands in the bewitching localities of Ilfracombe and Torquay; in addition to the advice of friends, the information of books, the frequent inspection of the Vivarium at the Zoological Gardens, the "peeps" graciously afforded into the "tanks" of Mr. Gosse, Mr. Warrington, and others learned in Zoophytes—and, moreover, acquaintance with the varied creatures to be seen in Mr. Lloyd's sale-room, in the bowers of Capstone Cottage, Ilfracombe, or in the pretty "Shellery" of Mr. Pike, at Brighton—we had to learn the lessons that are taught only by EXPERIENCE.

Atmosphere and light, and the least difference in position have such an effect both upon

* "This commercial link has been satisfactorily supplied by Mr. Lloyd, of 164, St. John Street Road, Islington. Mr. Lloyd, from whom we have derived much information, not only sells one, two, three, or, if it be wished, as many dozens of those charming creatures the Sea-Anemones, and Madrepores, and curious fun-shaped Tube-worms, together with sea-weeds in proportion, but he also keeps on hand numbers of glass jars and vases ready stocked, and with all the contents in a flourishing and domesticated condition, of such sizes as can be conveniently carried away in the hand, thus saving to the non-scientific all trouble and anxiety on the score of the accurate adjustment of the "balance of life." Here then we have an entirely new trade established in a locality where originality would seem to be most difficult;—even in London, where it is proverbial that "anything may be had for money:" and, as if to make the proverb more universally true, we have just shown that it is now possible to buy a mimic ocean, fully equipped. Mr. Lloyd also sells the marine salt we have adverted to, together with Aquarium vessels empty, of all sizes and shapes, both rectangular and curvilinear, specific gravity tests, and all other appliances, not only for marine, but for fluvial collections."

weeds and waters, that nothing but *observation*, in fact—will enable you to maintain a marine Aquarium in health and respectability. If you give too much light the water resists the intrusion, and becomes opaque; if too little, the animals pine away. You must have practice and patience: in truth there is as much pleasure in both these virtues as in the peace and prosperity of your "Aquarium." We tried the sea-water three several times, and with the same result; we ceased to overstock our sea farm, yet still the creatures died! The water was thrown away and the shingle washed over and over again; and an Irishwoman, a "help," who assists all our experiments, declared, "No wonder people got say-sick crossing the say, if the water was all like that!" At last, by Mr. Gosse's advice, we put our Aquarium under Mr. Lloyd's care; he nearly filled it with the composed water, replaced our weeds and shingle, and arranged the flagging *Actinie* in what he considered the best situations. The next day the water looked nearly clear, a delicate *Dianthus* had adhered to the glass, several *Bellis* had fixed themselves in the shingle, and those hardy fearless *Mesembryanthemums* were in their full bloom of activity. We felt singularly elated—we should have been so glad to have shown our mimic eavens, over which floated banners of the green *Ulva*, to Mr. Mitchell or Mr. Gosse, or even to the triumphant Mr. Warrington, who has kept his sea-water unchanged for upwards of five years, and whose venerable prawns prowl about perpetually, seeking what they may devour.

But soon after, another kind friend sent us a bountiful supply of animals and most beautiful sea-weed from Falmouth: we did not—however tempted by the swelling beauty of the *Gemmacea*, or the graceful bend of the *Dianthus*—overstock our tank with animal life; but we had a weakness for the picturesque, and we loaded it with seaweed; child-like, "because it looked so pretty!" Though we knew that the *Ulva latissima* is all sufficient for the purpose of keeping the water pure—still we were tempted, and the water soon became discoloured and turbid. Mr. Gosse says water under these circumstances can be brought back to purity by being placed in a dark closet, but we had not a "dark closet," and so were obliged to get another supply of Mr. Lloyd's prepared salt, and replenish our ocean; since then, we have been greatly successful, the water is "clear as crystal" now, and it has continued so for more than ten weeks.

The desire to know something about, and to possess some specimens of, those "living flowers," is becoming so general, that "agents" can be met with at most of our sea-side resorts, who will procure a sufficient number of "zoophytes" to effect a commencement; but, we repeat, without patience you cannot prosper.* Your tank may be on the plan of those at the Zoological Gardens, oblong, formed of plate-glass and slate, and bound with iron (mine contains about 18 gallons, the cost 4l. 10s.); you can have smaller vessels, from a finger-glass upwards; but all require patient observation, care, and cleanliness: whatever you put in must be first cleansed—of course, in salt-water.

Very recently, however, improvements have been made in tanks; and such improvements should be made extensively known; for in many ways they greatly augment the "new pleasure";

first, as avoiding all danger to the inmates; and next, as supplying articles of furniture so elegant as to be accessories to the drawing-room. I allude chiefly to the tanks manufactured by Messrs. Lloyd & Summerfield, of Birmingham. By a patented process, these gentlemen have substituted glass for wood and iron, in many cases where, heretofore, wood and iron were indispensable. In several of the large shop-windows of London, the whole is of glass—pillars, supports, and sashes. Thus, in the tank, the plates of glass are brought together by glass pipes, neither wood nor metal being used anywhere. The advantages are so obvious, that hereafter, we imagine, this principle will be

These gentlemen also manufacture a variety of globes, large cups, vases, and basins; so that all the wants and wishes of those who cultivate Aquaria may be hence supplied—taste as well as convenience having been studied. Examples may be seen at the Crystal Palace; and, if our impression be correct, those entirely of glass very little exceed in price those of mingled glass and iron.

A fresh water Aquarium is much more easily managed than a salt one, and the active movements of the fish increase its interest; but fish are by no means as varied and curious as the zoophytes. Wherever Nature is, there is interest and beauty, so you can choose one or the other—or you may have both. In addition to your tank you will require a syphon, a syringe (of either glass or zinc), and a long-handled wooden spoon, with a sponge tied on the handle end; you must also have a little glass "test," to regulate the density of the water.* If a town-dweller, we suppose you will obtain the prepared salt from Mr. Lloyd; although Mr. Gosse and Mr. Warrington prefer the sea-water, and it continues pure and healthy in their tanks; I have no doubt that when it can be procured pure, and not near the sea-beach—where it is necessarily injured by extraneous matter—it is far better than the artificial water. But whether you use the sea or the composed water, you must, first having washed and seasoned your tank for a few days (and all vessels, large or small, require a little salt water to stand in them for a day or two), put in a thin layer of sand, then a layer of shingle, then arrange a few carefully-washed rocky stones according to your own fancy, let them be rugged, because the *Actinie* can the better grasp them, and you can place your sea-weed to greater advantage; an arch, which you can easily build or have cut at a stone-mason's, is always pretty, and the sea-weeds hang well from the top; then put in your sea-weed, taking care that it is growing, and has its roots fixed to bits of rock or stone; the *Ulva latissima* (the delicate sea lettuce), and the coralines, are quite enough as a commencement;

* The syphon is necessary to draw off the water without confusing your arrangements; the syringe to throw in, (if used for five minutes once a day), a supply of fresh air; the "spoon" to remove the dead animals; and the sponge to clean the glass.

adopted universally, as at once more elegant, and more healthful to the inhabitants of tanks, either of fresh or salt-water, but especially the latter. We engrave one of these tanks; and it will be understood that it is entirely of glass.

But Messrs. Lloyd & Summerfield, we believe, designed these articles not so much to serve as tanks as for Fern-houses; although it is apparent that they are quite as well suited for the one as for the other. They are produced in very great varieties: some being larger and more shallow; others being without legs, to stand on tables; others are made to serve as fountains, standing on a graceful glass pillar, through which runs a metal pipe connected with a supply of water.

the "copper beech" of the ocean adds much to the beauty of your marine garden, the only difficulty being in the arrangement of light; it loves deep waters, and will fade beneath the rays of a strong sun. Having arranged your plants, leave them alone for two or three days, and then introduce the hardiest of your *Actinie*.

Mr. Warrington told us of a worm that conceals itself in the sand, beneath the shingle, and, in gratitude for its shelter devours all impure and dead substances; the prawns do this also, but we would not put prawns into new water, nor until the lower organisations of animal life had been fully established in their several localities: the *Bellis* (daisy) hanging from some rough stone; the *Dianthus* wandering imperceptibly along the glass, now looking like a knob of jelly, then extending like a telescope with a number of the most delicately cut fibres at the end—a living white carnation; the *Gemmacea*—so worthy of its name; and every class and colour of the *Mesembryanthemums* from the scarlet strawberry to the delicate olive green, are all safe tenants, and may be introduced at the same time. The *Crassicornis* we have not been able to keep alive more than a week—with one exception; a very small one fixed itself upon a fragment of rock, and we placed it near "high-water mark;" there it lived and bloomed seven weeks, at last dropped off and died. A very intelligent correspondent at Falmouth tells us that he takes his *Crassicornis* out of the water every day for a couple of hours, shakes a little gravel over them and returns them to the water, and that "they live months;" he does this "because," he says, "they are in their natural state frequently left exposed by the receding tide." I regret that I have not time to air them, as ladies air their lap-dogs—but the practice has reason in it.

It may be that the daisies (*Bellis*) will not fix, but "bloat" themselves out and roll about in the water; this is a bad sign, yet they may change their minds, and root well for all that; if, after three or four days, they are not fixed, they will lose their firmness and colour, become spongy, and not withdraw their tentacles when touched; then lift them to the surface of the water in your fishing-spoon, and you will soon perceive by the aroma that they are dead. Nothing dead must on any account be suffered to remain in the water, so throw them away, and put in

* Among the most intelligent agents we have met with is Mr. M. C. Pike, of Pool Valley, Brighton: he is a naturalist who has earnest joy in his vocation; and although Brighton is not the best place for variety of marine productions, he has established relations with other places, and can be useful in supplying the wants of collectors at very reasonable charges, and the information he gives with what he sells cannot fail to be instructive. He is a "dealer in shells, sea-weeds, and minerals;" but he supplies a small globe furnished with "sea things" for a few shillings; and may certainly be a valuable auxiliary to all who desire the new pleasure to be derived from the "Marine Vivarium." Of Mr. Heal and his daughter at Ilfracombe we have already spoken; they were among the earliest practical assistants of the naturalist, and have been, in a measure, taught their business by Mr. Gosse. We believe there is also a valuable agent at Weymouth. No doubt in many others of our sea-coast towns there are persons able as well as ready and willing to assist the collector, and it will give us pleasure to make them known.

others. Ascertain that your "test" globule floats upright, and when you force it down, if it rises slowly, very slowly to the surface, the water is fit; there is always, even when you cover your tank (which I strongly recommend you to do), an evaporation which renders your water too salt; you must prevent this by occasionally pouring in from a teacupfull to half a pint of fresh-filtered water, watching the movement of your "test;" you may also introduce the active and beautiful *Anthea cereus*, but I find it wiser to introduce the small not the large specimeus. My large *Anthea cereus* all died after two or three weeks, but I have two small ones which are growing; one fixed itself at what may be called "high-water mark" on the glass, the other floats on a leaf of *Uloa*, and never changes its quarters, while its sister moves an inch or so every day, but always near the surface; half-a-dozen periwinkles must be thrown into the water (taking care they do not remain on their backs), they will prevent the accumulation of decayed vegetation, and mow from off the glass the mossy growth which would soon obstruct your view of your favourites, if permitted to accumulate. Avoid disturbing the bottom of your tank; and note down the number you put in: a certain quantity of water can only afford nourishment to a certain quantity of animal or vegetable life, so I would entreat you not to overstock. You will require some (say for a tank of 18 gallons three or four,) prawns (not shrimps, who must burrow in sand, and do not float about like the beautiful prawns); they are the most gentlemanly scavengers you can imagine. All *Actinie* throw off a sort of cobweb, which in the absence of prawns I frequently sweep off with my sponge or a feather. I can see to a hair's breadth if my *Actinie* move during the night, or during my absence; they suffer from cold, and I lost several that I had just received from Mr. Dunstan, of Falmouth, simply because the water which warms the corridor where the tank stands, grew cold in the night, and the thermometer fell below freezing point; several *dianthus*, *bellis*, and *geniacea* were flat and dead in the morning. Crabs of all kinds are very active and interesting, but they are so restless and revolutionary in their movements, that I would not recommend them as inmates of an Aquarium; they scratch, and dodge, and tear everything; the hermit crabs—in fact, the whole crab family are the same: in mischief they are the very monkeys of the sea. I have still some beautiful madrepores which I brought from Ilfracombe in September; I know nothing more beautiful than the madrepores, when they bloom from out their caves; but do not let the large *Actinie* creep too near them; if once their tentacles embrace a madrepora, a prawn, a crab, a periwinkle, the next day they will disgorge the shell, but the substance will have been extracted. Sometimes, if my *Actinie* do not bloom freely in deep water, I remove them to the more shallow, and *vice versa*, which a young friend calls "giving them change of air;" though sometimes when I have removed a green, or a grey, or a scarlet *Actinia*, for the purpose of getting a nice bit of colour at a particular point, so as to add to the beauty of my tank, the obstinate thing has either slid away or died, as if in sheer perversity. I have, therefore, learned, if they seem healthy and happy in one situation, not to attempt to remove them to another.

I pray it may be understood that my notes upon this "new pleasure" are simply intended for the instruction of tyros, who will be saved much disappointment by going to the A, B, C of the "Aquarium," and then learning, from learned books and experience, what I—myself a learner—could not presume to teach. During the past winter, those "blossoms of the sea" have afforded me a great deal of enjoyment. Every bit of weed and rock—every zoophyte—has its little history. I have beguiled some lonely midnight moments by placing my candle, so as to produce different effects of light and shade on my mimic ocean; and those dim links between vegetable and animal life have carried me back, without an effort, to the delicious scenes from whence they came.

How patiently have we watched the receding tide, to enable us to explore the mysteries of

some tide-pool, difficult of access, but richly repaying our exertions by the abundance and variety of its inhabitants! How have we deplored the loss of a "specimen," and, like all bad workmen, quarrelled with our tools—"the hammer was too heavy," the "chisel too light!"—and, when we made sure of "such a magnificent *Bellis*," how foolish we have felt when it disappeared from our grasp, sinking into its rocky crevice, scarcely leaving a trace of its retreat! We triumph to this day in a *dianthus*, remembering how nearly our boat was upset beside a group of rocks off Torquay, while endeavouring to obtain the prize. What a delicious day that was! The overpowering heat of the southern sun, tempered by a breeze cool only by contrast, yet still refreshing! The sky, bright as in Italy! The distant plash of oars, as boat after boat passed to and from the delicious bays which indent the Devonshire coast with their mysterious beauty: there, a bold headland, purple and green amid its dark-browned rocks and golden veins, stands sentinel of sea and shore, shading without obscuring the low-roofed cottages, whose trellised roses and verdant lawns, hanging midway on yonder hills, realise an English Arcadia!

We frequently sought amongst the weeds which the lavish waves had heaped upon the strand for *Actinie*; and if we moved a stone, it seemed as if the bay produced nothing but crabs, such scrambling multitudes rushed forth and disappeared. We found one or two marvellously large "strawberries" there—one, who still hangs at the corner of our tank, like a pendant of "Love lies bleeding" always in active bloom, seeking what he may devour—a fragment of beef, a bit of chicken, a dead "*bellis*" or a minnow—a most gluttonous creature! and this reminds me that he is the only *Actinia* I have ever fed, though Mr. Warrington indulges his captives, at long intervals, with little scraps of mutton; and the blue old lobster, at the Zoological Gardens, has his food as regularly as the lions and tigers. But if you feed the zoophytes with palpable food, I doubt the possibility of keeping the water pure, and the water produces sufficient for their existence; though I dare say their growth would be increased by a more liberal supply.

It is quite amusing to observe how the little children, both at Torquay and Ilfracombe, have caught the taste of the times, and come to the sea-side visitor with a bunch of "zoophytes," as they used to do with a young bird or a bouquet of wild flowers. They patter along the shore with their bare feet, turning up the sea-shag, and astonishing the crabs and sand-hoppers; or plash boldly into the pools. One little fellow brought me a worm in great triumph, calling it a sea-serpent; while his sister—brown, though blue-eyed—produced a green *Actinia*, which survived until Christmas: it is pleasant to remember the children toiling up Capstone Hill, attracted as much by the music of the brass band as by the hope of selling "zoophytes."

We need only recal our own hours of most wearisome do-nothing-ness at watering-places, in days long syne, to properly estimate what this "new pleasure" was to us during our rambles along the coasts of North and South Devon—the lane-walks affording us such specimens of ferns and wild flowers as we never gathered before, and the shore rambles sending us to our lodgings with our living sea-flowers, to be turned into every available glass and basin, with the cheery and inexpensive speculation of how they would look "at home."*

* While at Ilfracombe last year, it was our happy fortune to meet there Mr. Gosse, with his "class;" it cannot be inappropriate here to say that this amiable and excellent gentleman, and accomplished naturalist, annually forms "classes," who accompany him to the sea-side, partly to obtain health, partly recreation, and partly knowledge, under the certainty that, in his valuable society, and that of his excellent lady, they will acquire much of all. We cannot do better—in gratitude for the pleasure and instruction he has given us—than print the "card" he has this year issued; for, although it is intended only for private circulation, he will not, we think, object to the publicity we give it, inasmuch as it may be the means of enabling some of our readers to enjoy this "new pleasure" under the best possible auspices and circumstances:—

"MARINE NATURAL HISTORY CLASS.—In the summer of 1855, I met, at Ilfracombe, on the coast of North Devon, a small party of ladies and gentlemen, who formed themselves into a Class for the study of Marine

It is impossible to admire these beautiful creatures, and the simple labours by which they exist, without thinking of Him who, insignificant as they appear, works for them and in them. Surely, if HE cares for them—which cannot except by the contentment they exhibit, acknowledge His bounty—how much more will HE care for us!

The amiable and enlightened Doctor Landborough claims a remote antiquity for these wonders of the shore. In one of his charming books,* he says, "the *Sertularia* that wave their plumes in the sea in the present day, are not in the least more skilful than those that lived immediately after the Deluge. But they can boast of kindred who were great before the flood—which have for ever passed away—though their existence is proved by their wonderful remains, buried in the rocks in every place of our land, and they can more proudly boast of kindred yet alive in foreign climes—numerous almost as the sand of the sea-shore, which have achieved what human power could never have accomplished, and with unwearied assiduity, are still carrying on works which the united efforts of myriads of millions of mankind would in vain attempt to effect. We speak of the coral-forming zoophytes of foreign seas."

Surely there is both simplicity and dignity in a pursuit which leads us to a more intimate knowledge of these dwellers in the sea, and when I perceive the birth of an *Actinia* and observe the little creature—hardly bigger than a pin's head—working its oars and seeking its own food, I cannot but feel that by "studying the nature and habits of these little denizens of the deep we see the kind hand of God, where our forefathers never thought of looking for it, and where we should not, in all probability, have seen it, but for the invention of the microscope. In the very lowest department of Zoology we deal with things that have life. Who, of earthly mould, can give life and voluntary motion to the smallest creature? This is God's doing; and it is not only marvellous, but pleasant to our eyes!

I have thus endeavoured to add my mite to a treasury, the wealth of which is open to all, earnestly desiring that many may share with me the enjoyment to be derived from this NEW PLEASURE. The longer we live the more we are impressed with the conviction that there can be no happiness that is not participated: it is a solemn yet a pleasant truth that we become happy by making others happy.

The "season" is now approaching when thousands will quit for a time the "busy hum" of cities for the breezy melody of the sea-shore: under such circumstances it becomes almost a duty to be idle; but surely "idle time" will not be "idly spent" by those whose daily strolls are ministers to a "new pleasure!"

Natural History. There was much to be done in the way of collecting, much to be learned in the way of study. Not a few species of interest, and some rarities, fell under our notice, scattered as we were over the rocks, and peeping into the pools, almost every day for a month. Then the prizes were to be brought home, and kept in little Aquariums for the study of their habits; their beauties to be investigated by the pocket lens, and the minutest kinds to be examined under the microscope. An hour or two was spent on the shore every day on which the tide and the weather were suitable; and, when otherwise, the occupation was varied by an indoor lesson, on the identification of the animals obtained, the specimens themselves affording illustrations. Thus the two great desiderata of young naturalists were attained simultaneously; they learned at the same time how to collect, and how to determine the names and the zoological relations of the specimens when found.

"A little also was effected in the way of dredging the sea-bottom and in surface-fishing for Medusæ, &c.; but our chief attention was directed to shore-collecting. Altogether, the experiment was found so agreeable, that I propose to repeat it by forming a similar party every year, if spared, at some suitable part of the coast.

"Such ladies or gentlemen as may wish to join the Class should give in their names to me, early in the summer; and any preliminary inquiries about plans, terms, &c., shall meet the requisite attention.

"P. H. Gosse."

ART IN CONTINENTAL STATES.

PARIS.—The splendid old building, the Hôtel de Cluny, is about to be isolated; the surrounding houses are now being pulled down for that purpose. This museum is daily increasing its stores of Art.—The celebrated manufactory of porcelain at Sèvres is to be converted into barracks; the porcelain works will be carried on in a new edifice to be built in the park at St. Clond.—The Exhibitions of Lyons and Bordeaux have been very brilliant this year; in that of Bordeaux, 49,717*f.* have been expended in purchases by the society of the *Amis des Arts*.—The Gallery du Luxembourg is about to receive several of the late purchases made at the Grand Exhibition, and will be augmented by about twenty paintings of high merit. Among them are "Hay-making," Rosa Bonheur; "Christ Mocked," by Gosse; "Burning of the Kent Indian," Gudin; "Funeral of St. Cecilia," by Bouguereau; "Tepidarium," by Chassereau; "Christ in the Garden," by Jalabert; "E. Lesueur at the Chartreuse;" landscapes by Troyon, Français, and Lecomte.—The restoration of the "Hemicycle" of P. Delaroche goes on well; the damage it received will scarcely be apparent when the repainting is finished.—The picture by M. Gosse, subject "St. Vincent de Paul converting his Master," and which has been for twenty years in the Luxembourg Gallery, has been given to the church of the Seminary of St. Pé.—The Emperor has bought the fine painting of "The Lake of the Four Cantons," by Calamé; the Empress that of "The Virgin and Child," by Deschwanden.—M. Sauvageot has been named conservator (honorary) of the museums; this gentleman had collected a valuable museum of articles of *virtù*, and has presented them to the nation, on condition that he has the care of them, with suitable apartments. We find in this collection an immense quantity of the Palissy ware, Italian majolicas, sculptured ivory and box-wood coffrets, statuettes, diptychs, mirrors, &c., Limoges enamels, Venice glass, portraits of the sixteenth century. It is said that an English *virtuoso* offered him 500,000*f.* for the collection, but he preferred the enjoyment of the same in the Louvre, in a room named the "Musée Sauvageot."—The fine weather has given an impulse to the improvements of Paris; houses are being pulled down on all sides; the town will soon deserve the title of the "Ville des Boulevards;" indeed, little that is old will shortly be left in Paris. Three of those beautiful little *tonnelles* of the mediæval times will soon be destroyed in one street, the Rue Haute-fenille.

OBITUARY.

MR. W. F. VARLEY.

WE have received from a correspondent the following biographical notice.

On the 2nd of February, died, at Ramsgate, aged 71, William Fleetwood Varley, artist, youngest brother of the celebrated landscape painter. He was a man condemned to know the severest changes of fortune, having entered the profession under the tuition of his brother with the fairest prospects before him, when a needle shot from an arrow on the playground of an academy entered his eye and nearly blinded him for some years; he in a measure regained his sight, but his eyes were ever afterwards too weak to admit of his pursuing the profession with an ardour sufficient to obtain eminence.

As a teacher he was highly patronised in Cornwall, Bath, and Oxford; at Bath he broke his right arm, which, not having been properly set, frequently gave him great pain, especially in cold weather. He married, had a large family of daughters, seven of whom, with one son, survive him; he now pursued his profession with great respectability, and to the advantage of himself and family.

When at Oxford, by the reckless frolics of a party of students, some of whom were his own pupils, he was nearly burnt to death. From the agonies he then endured, he was never wholly himself again, but gradually sunk in health and in circumstances, and, though assisted by his brother, he, with his numerous family, experienced every species of distress, even to the bitterness of want, and became a nervous, ruined man.

His death took place under happier circumstances than he had known for years, he having enjoyed the calm comforts of a domestic home for many months, under the roof of his excellent son-in-law, Mr. Joseph Conder, tended by a kind and affectionate daughter.

SPRING.

FROM THE STATUE BY B. E. SPENCE.

THIS statue has been recently executed in Rome, where the sculptor resides: Mr. Spence is also the author of two other figures, "Lavinia" and "Highland Mary," which have been engraved in our series at different periods. He has here treated the subject as it is usually represented in Iconology, where the pleasant season of Spring is always symbolised as a beautiful young female in a dancing attitude, crowned with a chaplet of flowers, and with a wreath of flowers in her hand: oftentimes flowers are seen shooting up beneath her feet, and young animals are playing at her side. The association of these objects with the impersonation are sufficiently obvious: poets and painters have in all ages thus represented her.

Joy to the teeming earth!

Once more from sleep awaking;

Blossom and bud are everywhere

In dell and forest breaking:

Fresh from the sunny south,

Dancing o'er hill and plain,

Come the light footsteps of young Spring;

—Joy to the world again!

O'er verdure-covered realms

She holds supreme dominion,

The fairest things that nature hath

Attend her bright pavilion;

Proclaiming Winter past,

The storm-fiend fled and dumb,

And that the time of singing-birds

Full pleasantly is come.

Hail to thee, beauteous Queen!

Of love a heavenly token,

In that the covenant with man

Shall not be void nor broken:

Immutable and sure

He sees the promise stand,

"Seed-time and harvest shall not cease

For ever through the land."

Yes, every thought of thee

Should be undimmed by sadness,

Though they are gone whose song of yore

Welcomed thy look of gladness.

Do not immortal flowers

Around their pathway cling?

Are not all seasons of their world

A never-ending Spring?

There is, to our mind, a peculiar gracefulness in Mr. Spence's conception of this figure: it conveys the idea of easy, elegant movement; the step is light and buoyant, yet well poised; the head, a little inclined, is indicative of motion; and the drapery, adhering closely to the front of the person, and slightly flowing behind, aids the idea which should be conveyed, that of progress. The outline of the whole figure may be so clearly made out—in some parts, as in the exterior lines of the lower limbs, it is perhaps rather too much defined, when the arrangement of the dress is considered—that it is easy to discern how carefully and correctly it is modelled; the sculptor evidently being unwilling that a suspicion should arise in the mind of any critic of his work of a desire to conceal defective modelling by covering it with drapery; just as we have known some painters who, unable to draw the hoofs of animals—not so easy a task, by the way, as might be supposed—often hide them in long grass or other herbage as a veil to incorrect drawing.

We should like to see the works of Mr. Spence more frequently in England than we do: he is a sculptor of great taste and ability; and although we cannot but be perfectly aware there is, comparatively, only small encouragement of his Art here, yet we are quite sure he would be appreciated in the way to which he is justly entitled. It is not meant to be implied by these remarks that Mr. Spence receives no commissions from this country, for we know he has executed several; but he rarely exhibits them, and therefore his name is not so familiar with the public as it deserves to be.

MODERN PAINTERS.*

Is it decent that Mr. Ruskin should assert Turner to have been killed by criticism? We have heard Turner within the walls of the Academy profess the most profound contempt for all and any criticism, and we know that he felt what he said. He has done kind things, but who will mock his memory with the mandarin assertion that he was a man of what is called "fine feeling"? He had a large and a solid reputation, which never could be injured by any of the absurd comparisons of his latter works to "salad oil and mustard." He has enjoyed a more extensive popularity of that kind most valuable to a painter than perhaps any artist that ever lived, and if he were content with the result, that was one of the best proofs of his good sense. It has been seriously asserted by painters of high position, men never given to facetiæ, that Turner's latter works were experiments on the intelligence of the public. This we cannot believe. What he did, he did earnestly, whether it were a picture painted on the walls of the Academy in twenty minutes, or one of the tree-stems, described by Mr. Ruskin, elaborated under a microscope during twenty days. He might have been soured from time to time by senseless observations on his works; but Turner sensitive!—commend us to a rhinoceros for a thin-skinned animal. Some proportion of what has been said of Turner is true, but it is the severest visitation that could rest on his memory to say that he perished of the infliction of criticism. We would vindicate him from that. But really he was never thoroughly himself after the publication of the first volumes of "Modern Painters." Were not his worst works painted after the appearance of these volumes? This painter's fondest friends may have placed "Modern Painters" above even him, and they may have assumed to discover in those productions that Turner was working up to the spirit of these essays, while, alas! he was only working down to them. Mr. Ruskin knows that even to a good cause apologies and recantations on the part of an advocate are most prejudicial: he is bound to defend Turner, for in doing so he defends himself, and, like a good pleader, he is little scrupulous. Perhaps Mr. Ruskin believes that the empiric toxicology of his volumes was too much for a man, whom certainly all who knew him would pronounce to be the last to be affected by such a treatise—a man who had lived so entirely with nature as to be altogether unimpressible by all the charlatanisms of his time—a sorcerer in his Art—but (we would not be uncharitable) one whom everybody knows to have been one of the *feræ naturæ* of society. But Mr. Ruskin seems now to have done with Turner; we trust it may be so, for his interpretation of the examples he instances from his works are such as to place in a very ridiculous light that which, according to the simple rendering intended by the artist, may be really beautiful. But to return to the book: we had expected in the chapter entitled "The Fields," to have seen something about that kind of nature for which artists usually look in the fields—something in reference to those who have painted the fields; but there is no allusion of this kind: the chapter is made up of excursive speculations on the favourite colours of ancient poets and mediæval painters. There are dissertations on the "pictures" of Milton, Dante, Shakspeare, Homer, and other poetical painters of less note. After having considered, as usual, a multitude of things altogether beside Art, the author proceeds to deductions. "There are, it seems to me, several important deductions to be made from these facts. The Greek, we have seen, delighted in the grass for its usefulness; the mediæval, as also we moderns, for its colour and beauty. But both dwell on it as the first element of the lovely landscape; we saw its use in Homer, we see also that Dante thinks the righteous spirits of the heathen enough comforted in Hades by having even the *image* of green grass put beneath their feet; the happy place in Purgatory has no other delight than its grass and flowers; and finally, in the terrestrial

* Concluded from p. 115.

SPRING.

ENGRAVED BY T. M. KNIGHT. FROM THE STATUE BY B. E. SPENCE

paradise, the feet of Matilda pause where the Lethe stream first bends the blades of grass. Consider a little what a depth there is in this great instinct of the human race. Gather a single blade of grass, and examine for a minute its narrow, sword-shaped strip of fluted green. Nothing, as it seems, there of notable goodness or beauty. A very little strength, and a very little tallness, and a few delicate long lines meeting in a point—not a perfect point neither, but blunt and unfinished, by no means a creditable or apparently much cared-for example of Nature's workmanship, &c. * * * * The fields! Follow but forth for a little time the thoughts of all that we ought to recognise in these words. All spring and summer is in them, the walks by silent scented paths," &c. Such is the material of which this chapter is composed; there is nothing of practical Art. Let the author write as many books as he pleases, but let him not assume that they are useful to the artist—at all auxiliary to the practice of Art. Another example of elaborate trifling is found in Mr. Ruskin's interpretation of the Italian word "bruno." "I was for some time embarrassed by Dante's use of it with respect to skies and water. Thus, in describing a simple twilight—not a Hades twilight, but an ordinarily fair evening—(Inf. ii., 1), he says, the 'brown' air took the animals of earth away from their fatigues; the waves under Charon's boat are 'brown' (Inf. iii., 117); and Lethe, which is perfectly clear, and yet dark as with oblivion, is '*bruno-bruno*,' brown, *exceedingly* brown." There is yet much more about this word, which, indeed, the author might have spared himself the trouble of writing, for it is well understood as simply meaning dark, and is a common word for twilight. All these dull diversions—and there are many of them—are analogous to what we have observed in the writer's notices of pictures: he fixes on a ripple or a wrinkle, and writes a page or a chapter on it, as the case may be. Hunt, the painter of "The Light of the World," has succeeded Turner in Mr. Ruskin's estimation, and many opportunities are found of mentioning him. In speaking of "affectation," it is said, "I know no painters without it, except one or two *Pre-Raphaelites* (chiefly Holman Hunt), and some simple water-colour painters, as William Hunt, William Turner, of Oxford, and the late George Robson; but these last have no invention, and therefore, by our fourth canon, chap. iii., sec. 21, are excluded from the first rank of artists; and of the *Pre-Raphaelites* there is here no question, as they in nowise represent the modern school." It might be very fairly asked of Mr. Ruskin what he means by "affectation." He does not mention the names of any painters who are signalised by "affectation," but we hear of some of those who are without it; they are chiefly artists who paint elaborately what they see; conversely, therefore, all who do not work on this principle are "affected." In the chapter entitled "Of Modern Landscape," really a fine subject, there is scarcely a page about painting; it turns entirely upon a consideration of certain of the modern poets. We are told that nothing is more notable or sorrowful in Scott's mind than its incapacity of steady belief in anything. He is educated a Presbyterian, and remains one, because it is the most sensible thing he can do if he is to remain in Edinburgh. He cared for neither painting nor sculpture, and was incapable of forming a judgment upon them. Byron is rather sulky and desperate than melancholy; Keats is sad because he is sickly; Shelley because he is impious; Scott's heartfelt and sincere love of nature is summed up in a few words by himself—"I, Scott, am nothing, and less than nothing; but these crags, and heaths, and clouds, how great they are, how lovely, how for ever to be beloved, only for their own silent, thoughtless sake." We may not, perhaps, agree entirely with Scott for the reasons he gives wherefore the rocks should be beloved; but we cannot help admiring Scott's humility of spirit as a contrast to the insufferable egotism of Ruskin. Scott is not allowed to be so subtle a colourist as Dante, which, under the circumstances of the age he could not be, but he depends quite as much upon colour for his power or pleasure. He does not say much about things, but the one character

which he gives is colour. If he has a sea-storm to paint in a single line, he does not, as a feeble poet would have done, employ some term descriptive of the temper or form of the waves: he does not call them angry or mountainous. He is content to strike them out with two dashes of Tintoret's favourite colours—

"The blackening wave is edged with white,
To inch and rock the sea-mews fly."

"There is no form in this; nay, the main virtue of it, is that it gets rid of all form. The dark raging of the sea, what form has that? But out of the cloud of its darkness those lightning flashes of the foam, coming at their terrible intervals,—you need no more." What are meant here as Tintoret's favourite colours? If black and white are Tintoret's favourite colours, how has he employed them? He was a great flesh colourist, finishing sometimes with glazes, at others with the carnation impasto: as a curious example of the latter, we refer Mr. Ruskin to the well-known head in the third or fourth saloon of the Pitti, painted, as it were, with a trowel. He may have used black and white as dead colouring; but where do black and white occur in Tintoret's works as a presumption of colour? They are employed generally for effect, either as principals or auxiliaries; and, where the one or the other prevails to any extent, there is a proportionate denegation of colour. Are we to believe that Mr. Ruskin is praising Scott for the simplicity of his tint? If so, how are we to reconcile what he says in an antecedent chapter, when he asserts that the colouring of nature cannot be too brilliant and luxuriant? Wherefore is it necessary to go so far away as Tintoretto in a question of painting, what perhaps Tintoretto never attempted? Had we desired a comparison, and especially in a question of painting water, we should have instanced at once Vandewelde, who, in his latter years, painted the sea in little else than black and white. But he did not paint the sea without form. If a sea without form be here commended, how is this to be reconciled with what is said in a former volume of the forms of the sea, in a description of Turner's picture of the slave ship! In that work (we speak only from memory) much of the force of the picture depends on the forms of the sea. Of this kind are the arguments under the heading "Of Modern Landscape;" a chapter which does not contain a sentence on the subject of modern landscape. Instead of treating of painters the entire essay is of poets; we have no objection to this; but, if there be any difference between versification and the practice of painting, this chapter should not have been called an essay on landscape. Mr. Ruskin concludes his volume with a chapter on the teachers of Turner; and concludes finally with a disquisition on the recent war. It is asserted that Turner, having suffered under the instruction of the Royal Academy, had to pass nearly thirty years of his life in recovering from its consequences. We have never seen anything in Turner's works that the Academy could have taught him: he drew figures execrably—worse than Claude; and the Academy does not teach clouds and sunshine. If he learnt anything of figure-drawing there, he must have been extremely well taught, that thirty years were necessary to his unteaching. We know living engravers who have continually improved his drawing in their plates from his works. In youth he is said to have wasted his time in painting subjects of no interest, as parks, villas, and ugly architecture in general; and, in late years, to have devoted his strength to meaningless classical compositions, such as the "Fall and Rise of Carthage," "Bay of Baie," "Daphne and Leucippas," and such others; which, with infinite accumulation of material, are yet utterly heartless and motionless; dead to the very roots of thought; and incapable of producing wholesome or useful effects on any human mind, except only as exhibitions of technical skill and graceful arrangements. The very qualities which are disparaged in the production of these works, are abundantly bepraised in the antecedent volumes.

Our notice of this volume has been what we ourselves consider slight; although, to a certain

class of readers, it may be already too long, and would have been tedious, had we followed the author analytically through all his propositions. We have from time to time counselled him for his good; but he is slow to acknowledge a benefit. We press his hand once more with this advice;—if he wish to gain credit for knowing something of Art, he must cease to sneer at the works of men of undoubted talent; men whose power is acknowledged in the face of the world; artists from whose reputation he could not detract one iota, were he to continue his so-called artistic diversions for a hundred years. Farewell, John Ruskin; if you are true to your word, we meet again in a brief space in the great room of the Royal Academy. Oh! that our friend would paint a picture!

ART IN THE PROVINCES.

MANCHESTER.—The men of Manchester are talking of erecting a Crystal Palace of their own for an exhibition, on a grand scale, of works of Art of every kind. The *Manchester Guardian* says—"The plan is to have a vast exhibition in Manchester, to embrace and be limited to everything that can be fairly comprised within the title of 'Art-treasures;' which will not only include pictures, engravings, sculpture, and statuary, but every variety of works of Art—as distinguished from works of industry, manufactures, machinery, and mechanism)—that can be collected, of all ages and countries, especially articles of taste and *virtù*, bronzes, marbles, medals and coins, gems in cameo and intaglio, works of Art in every metal and in many other substances, glass and china, ivory, wood, and stone,—in short, everything that is not mere workmanship, but may fairly be classed as Art. It is intended to have this Exhibition on a scale commensurate with the importance and dignity of this great metropolis of the manufacturing district; and the means proposed are a large guarantee fund, and the erection of an edifice of the magnificent character, if not the full dimensions, of the Crystal Palace of Hyde Park and Sydenham. We may express a confident opinion that the grandeur of the scheme, the vastness of the scale on which it is proposed to be accomplished, will give to it an attraction so universal and absorbing, as to secure its being, as a whole, self-supporting and remunerative. The Art-contributions from the private collections of Lancashire alone would cover acres of space. Everything augurs well for the success of an undertaking, conceived in a large and liberal spirit, and the plan of which is of proportions so colossal." We cannot at present understand whether the building is to be of a permanent kind or not: we can scarcely suppose that, with the example of the Sydenham Palace before them, gentlemen so shrewd and calculating as we know those of Manchester to be, can contemplate the erection of such another edifice, with a similar object, except for temporary purposes.

ST. ALBANS.—It is intended to attempt the restoration of the fine old Abbey Church of St. Albans, one of the noblest examples of Saxon architecture in the kingdom. A meeting, at which a large number of the county gentlemen, and of those interested in the preservation of our ancient architectural monuments, attended, has recently been held, when a liberal subscription was entered into for the purpose. It is supposed that St. Albans will be the seat of one of the new bishoprics which rumour states the government is about to create.

TAUNTON.—Mr. Cole, C.B., Inspector-General of the Department of Science and Art, lately visited Taunton, to aid a movement now making in the town for establishing a school of Art, which appears likely to be successfully carried out.

DUNDEE.—The travelling picture-dealers, driven out of the highways of the country, are seeking a mart for the disposal of their merchandise in nooks and corners. We have before us a catalogue of pictures recently offered for sale at Dundee, from the gallery of "the late Captain Rennard, of Southampton, a well-known collector." The names which figure pre-eminently in the list are, among others, those of Van Stry, N. Poussin, Sassoferrato, Tintoretto, Vandewelde, Panini, Paul Veronese, Brughel, Guercino, Cuyp, Jordaens, Blomaert, Spagnoletti, Murillo, Calcott, Danby, Cooper, Hogarth, Reynolds, Duncan, P. Nasmyth, Morland, Etty, &c. &c. The specimens realised from 2*l.* to 10*l.* each: not an unprofitable speculation, we should imagine, with nearly one hundred lots at the disposal of the auctioneer.

SUGGESTIONS OF SUBJECT

TO THE STUDENT IN ART.*

BY AN OLD TRAVELLER.

CHAPTER V.

The midnight Sun—Repose in the Wilderness—The World lies sleeping—Beatific influence of a beating—Immerita to witness—Good fortune of the Painter—He enters protest—Woe is me! for the *semper cadem*—Treasure trove!—A Dog that's new—A better Time coming—Penitence—Results—The Princes at Tewkesbury—Edward the King—The Son of Henry—Richard of Gloucester—A Leave-taking—Elizabeth Woodville and Elizabeth—“Porphyry-genita”—Her Brothers, also born in the Purple—An olden Tale of Wood-craft—Where are the Sheriff's eyes?—The Liege-man's Resolve—Doings of little Fiction—The Birds are coming!—Felicia Hemans—Wordsworth—Aristophanes—Division of Labour—Commissariat of the Magpie family—The Counsel of Antipas—The Ethnarch before the Sanhedrim—Simeon, whose name was Sameas—The Tetrarch beside the Fountain—Espousals of the Asmonæan Princess—The Feast of Tabernacles—The Death of Aristobulus—Arraignment of Mariamne—Defection and Death of Alexandra—The Sons of Mariamne—Costobarus the Idumean—Gadiah and Dosithens—Lapidation of Tero—Last Hours of Pheroras—Antipater the Son of Doris—The Close of all.

THE interest attaching itself to the Exhibition of works by German Artists, last year holding its third anniversary in London, was much increased by the many beautiful landscapes adorning its walls: those of Norwegian Forest and Fjord were more particularly remarkable, but among them was not one of those life-like reproductions of the MIDNIGHT SUN, for which Becker of Darmstadt, Saal of Heidelberg, and other German artists, have obtained a merited reputation.†

Among the works of the last-named painter is one,—much admired in the Austrian capital, and subsequently at Prague,—representing the Alps that rise above the Guldenbrands valley, as they lie under the deep crimson and rich rose tints of the midnight sun, in the months of June and July. The picture is one of unusually vast dimensions, a circumstance which I mention here, because, in a painting of this kind, size—if not, as in architectural effects, an element of beauty, is at least an advantage to be appreciated.

The scene chosen by the artist is a wild valley strewn with rocks, between which there grow painfully and reluctantly a few coarse herbs and stunted shrubs; in the back-ground is a range of high peaked mountains covered with snow—although we know that the season is midsummer, and the day that of St. John's festival—their grand and silent forms are reflected in the dark waters of a wide extended Fjord, now still and silent as themselves: over this waste of mountain, rock, and water, there shines the strange, weird, mysterious light of the midnight sun.

In the farthest distance the higher Alps are tinged with a delicate rose-hue, while the shadows of the lower range are blue and cool; but the bare gigantic rocks of the fore-ground are glowing like molten steel beneath the fervid beams, for they are still fervid, midnight though it be. Towards the far left of the picture, which exhibits a vast space, as we have said, the light is varied; a less glowing, yet still brilliant tinge of red is shining over all, and in the pale blue sky of this portion of the work are scattered, at wide intervals, great piles of clouds in strange fantastic forms, yet such as we have all seen at times in our own beautifully varying heavens.

But perhaps the most peculiar characteristic of this truly wondrous scene, and that which most effectually distinguishes it from every other, familiar to the dwellers in more southern climes, is the clear perception forced upon you that, despite the glowing sunshine, it is midnight; profound solitude, dead silence, inviolate stillness, all betoken the hour of universal repose: the painter has not permitted any human form to appear; silently, and with very

slow movement, a rein-deer is crossing a low hillock, but, beside him, not a living mortal is seen. Yes, you are made to feel that it is midnight, and if you could venture to speak in that solemn presence, it would be in the lowest of murmurs only. But can you speak?—by no means, it is not the time for converso, nor yet for movement, and being here, in the midst of this great pause of life, you sink down quietly into the couch of soft mosses and beside the stilly waters, and you take part in that calm and trusting repose in which the beautiful creation is all lying, child-like and helpless, yet softly breathing and in blest security, beneath the beneficent guardianship of the Father Supreme.

The rein-deer mentioned as passing across this strangely solemn “place of rest,”—for to this, notwithstanding the rudeness of the features, is the scene here depicted consecrated by the potency of the hour—the reindeer, I say, contributes greatly to the force of the general effect, by its singularly unrestrained and leisurely demeanour: this is not the moment for haste, there is nothing waking but himself, the beautiful world around him is all his own; his step—nay, he scarcely makes a step, he is only about to do so in good time—gives clear intimation of his perfect ease, and this attitude of the animal has been judiciously adopted by the painter, being, as it is, in perfect harmony with the profoundly touching scene he has depicted.

There is a picture of similar character and also of great merit, but with different treatment, by Leu of Dusseldorf, to which I would fain call your attention; but uncertain whether both may not have been exhibited in our country last year, I refrain from doing so, since, in that case, they will most probably have been discussed by the Critic in Art, who takes possession of the whole subject, and does not confine himself, as is the case with the present writer, to the mere choice of the theme.

“Blessed is he who hath got himself well beaten, for he shall mend his manners,”—such is the purport, or nearly so, of an adage not unfrequently heard in Immerita, and if we cannot subscribe cordially to the truth of its averment, neither is this a convenient opportunity for proving the fallacy thereof. Let us even assume it true for the moment, and that accorded, how fortunate is your case, oh ye painters, and how effectually shall your manners be mended!

For such an amount of “stick-meat” as they are making you eat! *Ye Bogh!* as the Muscovite says,—and a learned man is your Russ, when the *batogs* are in question—they have provided you with rods of every growth and thickness; you have but to choose and must by this time have decided which tree you like best, unless you are very difficult indeed: at all events you will have acquired a critical judgment in the discrimination of varieties.

Right and left you are getting it—blows are raining from every point of the compass and all at once, so that, beneath which side of the hedge you were best take shelter must be a question just now puzzling you mightily, the rather as you do not all seem to be largely gifted in the bump of find-which-way-the-wind—blows-ativeness, if we are to judge by the fashion in which you place some of your poor creatures *à l'abri*, when you have first exposed them to pitiless storms. For proof of this, I refer you to *qui de droit*.

“They are being very uncivil persons, these Critics!—and why should we care for them? We won't! for say they have some show of right on their side, when they abuse Blank Blank, of Blank, and demolish What's-Lis-name, and tear in pieces no end of other fellows, yet my picture of—never mind its title—is a good one, and if they have not the wit to discern its merit, so much the worse for them.”

Well, that is all very true perhaps, and, argumentative beside,—“if we had but the wit to discern its force,” and clever too perhaps, and above all useful, for criticism will be doubtless put down by its eloquence, or if not, it ought to be, but in despite of your oratory, the critics are now grumbling, and they will grumble. Why,

they maintain—But no, we won't repeat their talk of “this not right” and the other “all wrong”—why should we, since you don't intend to profit by it? Let us rather confine ourselves to what concerns our own especial matters, and hear what they say of that ceaseless iteration whereof they make their plaint. One deplores what he is pleased to call “the yearly increasing tendency of artists to repeat themselves,” and adds, “this perpetual repetition would be bad enough if the pictures were good, but as things are!”

“Enough of him!”

Hear the next then—“This never-ending recurrence of poor and meaningless subjects has been long matter of universal complaint. This year we are more than ever oppressed by—”

You don't like that neither? Let us try a third—“Weak and shallow! what has become of the rich invention once—”

You wave your hand impatiently, you will not have that *non plus!* but there is then no hope of pleasing you, for all is in the same tone! One declares that “even of the good pictures, people are disposed to speak reproachfully, after counting the number of times each subject is repeated in every essential point, all over the galleries.” He further asks, “Why must we have the same Italian boys in all sorts of disguises and in half a hundred exhibitions?”

Complainant then proceeds to specify cases wherein the same figures are presented perpetually with only the slightest difference, but we do not give place to the instances—our remarks are general—not particular: he adds piteously, “These children we have seen *ever so many times!*” And hath he so? the poor good man! But are you not ashamed so to becheat him of his reasonable expectations? and have not things come to an evil pass when a good friend and warm lover of yourselves and your works is reduced to self-gratulation over “this dog, because he is *new* to us?”

For observe; what the writers I now cite are complaining of is, not things bad—but things old—“iteration”—omitting the malediction—“iteration is the burthen of their Jeremiads,—“Who shall deliver us from these weariful self-repeating?” they exclaim; and they are right. One remarks, and certainly not without cause—“There is an utter absence throughout, of pictures from Scripture, from English history, from English poetry, and even from English fiction.”

And they are your friends who speak thus, they are those who wish you well, and who wish well to Art. Yet these it is whom you compel to ask you—Is there no such thing as a Goldsmith in the land! has no tradition of a Lemprère, ever penetrated your haunts? or could you not at least contrive an introduction to some penny story-book, (in this our day, when the supply of intellectual needs is not particularly meagre,) with, it may be, an apology for a picture upon its front, by way of rousing up your imagination a little?

Nay, but wherefore will you suffer these discourtesies to be addressed to you? and how long shall the regrets of your friendly monitors be rendered yearly more profound? “No scripture subject—no history—not even fiction.”—You will surely not let further cause be given for these too justly merited accusations, since it is certain that the power of preventing them is in your own hands.

Of the scriptural subjects we will not now speak, we are not in fitting mood for the discussion: but what prevents you from turning to history? that of every nation lies open to you, not one shall refuse its stores,—or to poetry, and in that bright region you shall find equal riches; meet as cordial a welcome. For the realms of fiction, I do make mine avowal that they be somewhat of the widest; they demand a peculiar kind of courage from him who shall enter on quest therein, but at worst you shall find a very plethora of provender, and if it be not of the daintiest, let us have it nevertheless, since better may not be; food of any kind is better than famine. Give us something. Let it no longer be said, as of late it hath been and with too much truth, “Our English artists are neglecting books and men, they shun galleries and whatever tends to promote the love of Art

* Continued from p. 104.

† Since writing the above, it has occurred to us, that the two previous exhibitions of the German artists may have made our youngest student acquainted with these works, but the writer was not in England on either of those occasions, and cannot at the moment refer to the obvious sources of information.

in its highest phases, as if some pestilence were in the air of all that elevates. Many have even severed all connection with the realms of fancy and seem to have abandoned themselves to the rule of common-place."

It is true that the critics have as yet but the light skirmishers before them, and when the great guns of the Academy are brought to bear, they may see cause to change their tone. And you will perhaps say "Neither is this the heaviest artillery of criticism that comes rattling about our ears." Perhaps not, but if the *mitraille* be effective, one gets pretty well peppered even by that, and methinks the shower falling on this occasion is none of the lightest. Then the weapon of your assailant is ever the more sharply penetrative when he has pointed it with a truth, and I ask you if these that are now flying about you do not "hit in the white" every one?

Still, it is not I who will consent to despair of a good time coming, had we not the dawn of it in the very last year's works? were there not the — of — but no — there shall be no names or titles specified, we know what we know, and by and bye we shall have better still. Even now you do not all wear those defiant looks of "Harry, who didn't care!" with which you began to listen, as we repeated to you what your friendly critics are saying. There are some of you indeed who seem to be getting your penitent faces on. Good boys! One has even crept into a corner, slate and pencil in hand; he has determined on some grave exposition of History! you divine it by the importance of his preparations. A second rubs his eyes—he has heard of the "fine frenzy rolling," you shall see now if he will not give us poetry! As to you third! I think he must have borrowed the milkman's chalk: what has made him so short of tools, and bow does he mean to employ the loan he has secured? perhaps he will regale us with some preparation from the *cuisine* of fiction, we shall see.

Suppose we look over the shiny shoulder of each toiling urchin—and I would that some one might paint me this studio bodily, every tiny man depicted as he is bending him to his task,—what may History be doing to begin with?

None so bad upon my word! He has made us a tent—a regal pavilion rather—ample of dimensions and richly appointed; the period he has chosen considered, for you see that the warrior figures who occupy the interior are Edward IV., with his brothers, Richard of Gloucester and George of Clarence. Other leaders are also there, Lord Hastings among them; but who is the handsome youth so boldly confronting the king?

Alas, it must needs be the unhappy son of Henry VI., and our student has given us the tragedy that closed the battle of Tewkesbury.

King Edward is asking—as we know he did—"How darest thou so presuming, with banner displayed, to enter this my realm?" And the youth—according to Speed—is replying: "It is not thy realm, but that of thy sovereign and mine, King Henry VI. and I come to recover my father's most rightful inheritance."

"Then," says the same historian, "did King Edward, with his gauntlet, dash the prince on the mouth, whom Gloucester, Clarence, Hastings, and the rest did then most shamefully murder, even before the face of the king." *

Another moment and these acts of violence shall be in course of their unhappy progress; but our limner has pleased to give us the point of time as above stated—and the wiser man he:—not badly done either. King Edward, handsome, but of hard and doubtful expression, with as much cruelty of aspect as a face still youthful might well express; Richard, also very young, —not twenty in fact—no vulgar hunchback, a somewhat ungraceful person, but with more of intellect on his brow than belongs to any other in the assembly; George of Clarence is weak and treacherous looking—and rightly so, for a

notable traitor he was, as the unhappy Warwick, his father-in-law, had already learned to his cost. All are good and characteristic figures; wherefore, borrowing words of encouragement from that kindly personage, Dame Juliana Berners, I cannot but say—"Loke ye do ever soe, my dere child, and ye shall come good speede."

But he turns his slate! The good fellow! he has done us another; who said there should be no more history? Edward IV. again, but this time with his Queen, Elizabeth Woodville and her three fair children: Edward V., a two-months' king; Richard of York, now turning his sweet bright face of six years old, towards the uncle, who was afterwards to incur the infamy of being his murderer—whether justly or not has never yet been made clear; and Elizabeth, doomed subsequently to become the detested wife of Gloucester's mean successor—Henry of Richmond.

Not so rigidly matter of pure and authentic history as the last picture, this, which is apparently a leave taking for some short absence, is yet correct as regards the personages depicted. The two princes—Edward the King and his brother, Richard of Gloucester, are much older than in our previous study; the period is indeed that immediately preceding Edward's last and fatal illness, as is manifest from the age of the children, nor have the excesses of his life failed to produce effects that are even now visible; Richard is urging his brother to hasten, but Elizabeth—her beautiful face much careworn—has still some words to say, and the king pauses to listen. Her eldest son is standing close beside her; he eyes his uncle Richard doubtfully, but the younger boy, a child of little more than six years old, is clearly preferring some childish suit to Gloucester, whom he holds fast by the hand. It is an effective picture; said we not well—"there's a good time coming."

Now for my little Poetry: he comes tossing his bright curls well from his brow, and there is a right saucy look in the merry bright eye of him; it is not in melting mood that he has been working, and so may be seen. He is holding his picture on a fat round rosy knee;—such have I seen in a certain chamber of the Vatican;—who will fail to remember the instance? An old-world tale of archery perfol: The "proud sheriff of Nottingham,"—no less a personage—hiring Little John "to be his manne," as he did to his sore repentance and heavy discomfiture; a fact that none of us can have forgotten. But what possesses the sheriff to trust him?—might he not see the roguish purpose of the tall archer in those bold laughing eyes? No wonder my Poetry's two good-looking blue orbs should themselves laugh as he recalls his work. The sheriff too, a very comfortable sort of personage, not too obese,—my "dere childe," Poesie, has too much good taste to fall into caricature;—beside that, so keen a lover of wood-craft as was the sheriff, must needs have kept some measure in the matter of girdle. The scene is a sort of chase, at no great distance from the town, since we have the towers of a cathedral in the extreme left, with some portion of a rich and stately abbey appearing beneath the magnificent oaks of the middle distance. Well done! and very well done too, my Poetry, also. The words that served to inspire him, after he had well rubbed his eyes, would seem to have been these that follow:—

"Lithe and listen, gentle-men,
All that now be here,
Of little Johan, that was the knightis man,
Good mirthe ye shall hear.

* * * * *
"Three times little John shot about,
And alway cleft the wand,
The proud sheriffe of Nottingham,
By the marks 'gan stand.

"The sheriff swore a full great oathe,
'By him that died on tree,
This manne he is the best archere
That ever yet saw I me.

"Say me now, wight young man,
What is now thy name?
In what country wert thou born
When-as thou wast at hame?"

"In Holdernesse I was born,
I wis that from my dame,
Men call me Reynold Greneleaf,
When-as I am at hame."

"Say me, Reynold Greneleaf,
Wilt thou dwell with me,
And every year I will give thee
Twenty mark to thy fee?"

* * * * *
"Now so God me help," said little Johan,
And by my true lowtce,*
I shall be the worst servaunte to him,
That ever yet had he!"

Without doubt he will; and this is clearly the thought which it has seemed good to our painter to reproduce on his face. How is it that the sheriff does not see it there? Of the "mirthe" that ensued from the fact that he had not the faculty for doing so, another good picture might be made, and perhaps will be; but of this at some future time. We have now to look after little Fiction.

He has given us a solitary figure only, but full of promise; let us look at it somewhat closely. A subject taken from the very prince of his class—even Defoe; and the moment is one abounding in the deepest interest. It is that when the hero of the book—everybody's hero, for it is Robinson Crusoe—describes his terrible discovery of the foot-prints on the shore.

"One day it happened that, going to my boat, I saw the print of a man's naked foot on the shore, very evident on the sand, as the toes, heel, and every part of it. Had I seen an apparition in the most frightful shape, I could not have been more confounded. My willing ears gave the strictest attention. I cast my eyes around, but could satisfy neither the one nor the other. * * * * * Struck with confusion and horror, I returned to my habitation. That night my eyes were never closed."†

Manifestly they have no chance for doing so: dread and anguish have murdered sleep. You have but to look on the lone figure before you to be sure of it, and if, in their effective simplicity, the words of our author are eloquent, so also is this rendering of them by the painter. The utter loneliness of the solitary man is impressed on you with a force there is no resisting; you do not look in the distance for any other figure—you feel that there is none. Solitude has no partner in her reign, save only Silence, and she too is absolute; the stillness is unbroken, the water laving the boat can make no sound, for it lies altogether without motion, and it is the slight and almost imperceptible movement of the boat itself that alone breaks the level of the waveless shore.

Well done to Fiction also, then, and there shall be no more talk of slate-pencils or the milkmau's chalk; 'tis a pleasant thing to be able to shake hands cordially with one's "dere children" all, and to say with the genial abbeſs of St. Alban's, "ye shall speede welle."

For the last six weeks has one of Nature's gladdest and most entrancing voices been calling us forth, that proceeding from the rejoicing birds, namely: nay, the woodlark has sent out her invitations even longer than that, and despite the acrimony of the weather, she found courage to make her sweet notes heard even in the doubtful days of February. March brought us the blackbird and thrush, nor were there wanting snow-drop and brilliant violet to give them welcome; these greeted even your wearied eyes, oh, unhappy ones, who do not escape from the far-reaching breath of the toiling town, but for ye—beloved of the kinder gods—who may take your way deep into the unspoiled wilds, there is less sophisticated company, and whither-soever your path may lead you, there shall rise the music of a glad some brotherhood to greet your advent withal.

Is your way across the fields, you find the joyous bunting crossing your path in his merriest mood; keep forward to the bright streams, and you shall have the reed-sparrow to bear you com-

* Loyalty.

† "Life and most surprising Adventures of Robinson Crusoe, of York, Mariner," edit. London, 1719, p. 65.

* So Speed and other chroniclers; but we are not to forget that Bernard Andreas, a well-accredited author, writing within less than forty years after the event, declares Prince Edward, son of Henry VI., to have been killed in the battle of Tewkesbury, and the story here related is by many affirmed to have been invented by the enemies of the House of York.

pany; pursue the breezy upland, and lose yourselves among the sheep-walks,—there you need have no fear of oppression from too profound a solitude—pleasant is the society awaiting you there, were it only in the person of the stone-crow; or if you more affect the woodlands, there will come the willow-wren to cheer you with her note. On the downs are the wheat-ear and the lap-wing, to say nothing of their agreeable neighbour the whinchat, snugly nestling amidst the furze. Blithesome now is the ring-ousel on a thousand hills; or should none of these delicious haunts be within your reach, and you have but the beach of the coast for all appanage, even there shall the sea-mew be found hastening to exhibit for you the most graceful measure that he can dance with his gay red legs, as who should say “not even amidst unpromising sands shall you fail to meet some creature rejoicing in the happiness provided by Nature’s bounty for all.”

To the glad arrival of the passage-birds, there will be none so cold as to profess indifference. Who is there that does not think long of her coming, if the nightingale delay to follow her mate* beyond the last days of the showery April? Hear, also, the truth and the wisdom that come to us with these beloved wayfarers, when adjured to declare their mission by such as know how to enquire aright. It is Felicia Hemans that questions them; these are her words,—

“ ‘Birds! joyous birds of the wandering wing,
Whence is it ye come with the flowers of spring?’ ”

And they answer promptly—

“ ‘We come from the shores of the green old Nile,
From the land where the Roses of Sharon smile,
From the palms that wave through the Indian sky,
From the myrrh-trees of glowing Araby.’ ”

“ ‘And what have ye found on the monarch’s dome,
Since last ye traversed the blue sea’s foam?’ ”

“ ‘We have found a change, we have found a pall,
And a gloom o’ershadowing the banquet-hall,
And a mark on the earth, as of life-drops spilt,—
Nought looks the same save the nest that we built.’ ”

“ ‘Oh, joyous birds, it hath still been so,
Through the halls of kings doth the tempest go,
But the hints of the hamlet lie still and deep,
And the hills o’er their quiet a vigil keep.
Say, what have ye found in the peasant’s cot,
Since last ye parted from that sweet spot?’ ”

“ ‘A change we have found there, and many a change,
Faces and footsteps and all things strange.
Gone are the heads of the silvery hair,
And the young that were have a brow of care,
And the place is hushed where the children played,
Nought looks the same save the nest that we made.’ ”

“ ‘Sad is your tale of the beautiful earth,
Birds that o’ersweep it in power and mirth!
Yet, through the wastes of the trackless air,
Ye have a guide, and shall we despair?
Ye over desert and deep have passed,
So may we reach our bright home at last.’ ”

Hear, too, what Wordsworth finds to say to your oldest of old acquaintance, the heart-gladdening skylark—

“ ‘Ethereal minstrel! pilgrim of the sky;
Dost thou despise the earth where cares abound?
Or, while thy wings aspire, are heart and eye
Both with thy nest upon the dewy ground?
Thy nest, which thou canst drop into at will,
Those quivering wings composed, and music still!’ ”

“ ‘To the last point of vision and beyond,
Monnt, daring warbler! that love-prompted strain
(Twixt thee and thine a never-failing bond),
Thrills not the less the bosom of the plain.
Yet mightst thou seem, proud privilege! to sing
All independent of the leafy spring.’ ”

“ ‘Leave to the nightingale the shady wood,
A privacy of glorious light is thine,
Whence thou dost pour upon the world a flood
Of harmony, with rapture more divine.
Type of the wise, who soar, but never roam,
True to the kindred points of heaven and home.’ ”

Of the ability exhibited by birds, when it pleases them to become artificers, let us hear what Aristophanes declares:—

“ ‘Birds, with their own good hands, have wrought these works.’ ”

* The male bird is known to arrive invariably some fifteen days or so before the female.

Bricklayer, nor stone-mason, nor carpenter,
But birds with their own hands—’tis marvellous!
From Libya came about three million cranes,
Who had swallowed stones for the foundation: then
The corn-rails, with their beaks, did chip and hew;
The storks, another myriad, bare the bricks,
While water, to the air from underneath
Was brought by sea-larks and the river-birds.
Pisthetarus. And who with mortar served them?
Messenger. Herons, with hods.
Pisth. And how did they the mortar throw therein?
Mes. That, too, was managed, sir, most dexterously,
For by their feet the geese, with understroke,
As ’twere with trowels, cast it in the hods.
Pisth. Oh, what may not by help of feet be done!
Mes. Aye, and the drakes, by Jove! with aprons
tucked up,
Bare bricks, and after them, like serving-lads,
Flew up, with cement in their mouths, the swallows.
Pisth. Who now would pay hired labourers for his
work?
But, let me see, the timber-work o’ th’ wall,
Who wrought at that?
Mes. Those carpenter-fowls, the hickwalls,*
Who with their beaks did hack the gates out workmanly,
And of their hacking the like sound arose
As in a dock-yard.”†

Now we do not bid you paint the good drakes with their aprons tucked up, nor insist on a picture of herons stiling along under hods of mortar as aforesaid; yet has the artist occasionally made him merry with “metal” infinitely less “attractive;” and if you do nothing worse than reproduce the old Greek dramatist, all the easier shall be your shrift. Meanwhile there is a story told by an observant traveller in our own country, wherein the power of combination, not unfrequently refused to animals by writers who treat of their instinct, is singularly exemplified. More than one good name, well-honoured in Art, might be cited, whereof the owners would indubitably have called pencil to aid had they witnessed the little incident thus described by the traveller in question.

“On the road between Huntley and Portsoy, I observed two magpies hopping round a great bush within the garden of a poor-looking house, and remarking something peculiar in their proceedings, I stopped to see what they were doing. The countryman then told me, that these magpies had built there during several successive years, and had brought up their young in that bush; he added that they had not only barricaded their nest, but had so strongly encircled the bush itself with briars and thorns, that no cat or hawk could penetrate to the young; nay, so formidable were their defences that it would cost even a fox, cunning as he is, some days of painful labour before he could get into the nest. I found that the whole length of my arm did not suffice to reach from the outside of the bush to the centre, so that man himself could not break through without the use of a hedge-knife, hatch-bill, or something of the kind. The parent-birds fed their young with frogs, mice, worms, or any thing living within their power to subdue.”

So far our traveller loquiter. One day it chanced that the mother magpie had ventured to attack a rat in the absence of her mate, but after a long battle the quadruped was on the point of getting the best of it, and was fast making off, when one of the young ones came from the nest and joined the fight; a conflict of great animation then ensued, but their antagonist was too many for both mother and son, and the rat would still have escaped had not the father happily arrived with a dead mouse in his bill; this he deposited safely, then adding his forces to those of his wife and heir, poor Ratibolan was eventually killed, when that handsome piece of venison, which had previously formed his personal identity, went to swell the stores of the magpie larder.

After that, do not say that birds are incapable of combining; above all, admit their talents for performing the duties of the commissariat.

“Stand not before the Sanhedrim as stands the guilt-stained, or the suppliant, but appear thou in thy might and thy splendour; be the purple of thy sovereignty the robe of thy wear; and let the most approved and faithful of thy guard keep watch around thee.”

Such were the counsels of Antipater, or as, in

the Hebrew form, he is called, of Antipas, the father of Herod, when the latter, summoned to answer for the death of Hezekias, had finally determined to appear before the great tribunal of the Jewish nation in awful convocation assembled. For their president the Sanhedrim had the high-priest Hyrcanus, grandson of that renowned pontiff;—one of the most distinguished among the Asmonean rulers of his people,—the great John Hyrcanus, and inheritor of his name no less than of his office. Well had it been for the Hebrew nation had he likewise inherited his grandsire’s indomitable force of will; but this boon had been withheld, and in the countenance of the high-priest you detect the weak irresolution of his character.

The respect of Herod for his father was unbounded, it was equalled only by his love; had the wise and able Antipater enjoyed length of days, his son might have developed only those finer qualities which he certainly possessed, but the father died untimely, and from that misfortune dates the downward tendency of Herod.

Conforming to the counsels of that beloved father, it is in his “pride of place” that the young Ethnarch—he was then sole governor of Galilee—advances to confront his judges; martial forms precede, and open to him a broad free path up the hall of justice. Herod is in the first summer of his youth, and of faultless beauty. Thus it is that you shall paint him: he comes arrayed in robes of flowing amplitude, and of the richest texture; jewels of mighty cost lend all their lustre to heighten the gorgeous effect of his imposing presence. Nor are those who should repress that insolence of demeanour wholly uninfluenced by his boldness: the awful patriarchs wear looks of doubt and anxiety; some are gathering their robes around them as do men who are meditating flight; but there is one who rises superior to that unworthy weakness, and even more beautiful than the brilliant youth of Herod, is the reverend age of him who lends on the glittering Ethnarch the full majesty of his reproving gaze, after he has exhorted his brethren to remember their duty.

These are some few of his words, as recorded by Josephus—read them; and there cannot fail to rise before you that high nobility of aspect, which it is for you to render permanent on your honoured canvas, in the person of the grave and reverend speaker.

“Oh, you that are assessors with me, and thou, Hyrcanus, who art our chief, I neither have ever myself known such a case, nor do I suppose that any one of you can name its parallel, that one called to take his trial at our hands, ever stood in such a manner before us. For every man, whoever he be, coming to be tried by this Sanhedrim, presents himself submissively, as one in fear, and who would move us to compassion: all come hither with hair dishevelled, and in the garments of mourning; but this man Herod, accented of murder, and called to answer an accusation so heavy, stands clothed in purple, his hair finely trimmed, and his men of war around him. Now if we condemn this man, he may slay us, and shall himself escape; neither do I now complain of Herod himself in this matter; he is more concerned for his own safety than for your laws. But know ye, my brethren, that God is great, and by this very man, whom ye, for the sake of Hyrcanus, will now absolve, shall he punish both yourselves and your chief.”*

Thus spoke Simeon, whose name was Sameas,† and the effect was immediate; some anxious faces still remained in the assembly, and so must you depict these men of feeble heart; but, turning their eyes on the noble Sameas, are others worthy to be his compeers; let the dignity and distinction of their majestic persons not be lost in your hands. These men are

* “Nor did Sameas fail to prove a true prophet,” says Josephus; Herod, when king, slew all the members of that Sanhedrim, Hyrcanus included; Sameas alone, “whom he honoured for his righteousness,” was permitted to escape, although he still persisted in maintaining that evil would befall the Jews at the hands of Herod. See Antiq., h. xiv., c. 9, sect. 4.

† Ireland observes, that the Talmudists confirm this account: they call Sameas, Simcon the son of Shetach. Ibid., note.

* Hickwall, the woodpecker.

† “Birds of Aristophanes,” Cary’s translation, p. 109.

prepared to affirm his decision, and will uphold the sanctity of their law to the death. But the high-priest extends his hand, he defers the discussion to some future day, the Sanhedrim is adjourned, and the Ethnarch is saved.

Look closely at Hyrcanus, for this is your moment, and it is now that you must paint the picture. No worthy successor of the Asmonean princes, there is yet a certain dignity in his bearing as he utters the few words whereby the assembly is dissolved; notwithstanding his deplorable irresolution of character, you have still the descendant of a noble race for your study. Nor is Hyrcanus actuated solely, by unworthy motives, in thus shielding Herod from the ire of the Sanhedrim; it is not for dread of Sextus Cæsar that he labours to save the Ethnarch, the letters of the Syrian general may have had their effect, but "Hyrcanus loved the youth as his own son," says Josephus; and at this time Herod was not unworthy of his affection.

Neither was the act of which he was accused a murder. Hezekias, a noted robber and assassin, had been justly punished—the whole fault of Herod was that he had put him to death without first obtaining the sanction of the Sanhedrim—an illegal action, but not a crime. Thus there is a conviction of his own rectitude on the proud brow of the accused, and this lends valuable aid to the fine effect you will produce by the mere portraiture of his magnificent beauty.

Your next picture of him is wholly different, and must show him under a less favourable aspect. His first great crime has been committed, he has caused the secret murder of Malichus, and if his provocation has been great—for by Malichus, his beloved father, even Antipater has been foully poisoned—* so also is the guilt now resting heavily on his soul, and you have no longer the consciousness of an upright intention to depict. Oh! "*Facilis descensus Averni*;" let us never forget it!

"*Facilis descensus Averni:*
Sed revocare gradum, superasque evadere ad auras,
Hoc opus, hic labor est."

His first youth has passed; Herod, now Tetrarch, is in the force of his manhood; thus it is a figure of imposing stateliness rather than of youthful grace, that you have here to set before us. He is standing beside a fountain within the great court of his palace; pain and grief are in every feature, for the brother of his dearest love—the brave and sincere Phasaelus, has fallen into the toils of the wily Parthian, from which he shall escape only by a painful death.† Herod feels that the power to save that beloved brother is not with him, although he would give his heart's blood to secure it, and the iron hath entered into his soul.

Bitter is the expression with which he follows the retreating figures of the Parthian messengers, who have come to entrap him also, if that be possible; but he distrusts their purpose, and they are departing foiled. Soldiers of his guard recline beneath the shade of the portico surrounding the court; they mark his displeasure, and some are placing a ready hand on their weapons, but their commander gives no sign and they retain their place. Crossing from the colonnade to the fountain, is a woman of regal beauty, though no longer young, this is Alexandra, the daughter of Hyrcanus, and mother of Mariamne, Herod's betrothed but not yet wedded wife. She comes to implore that he will not go forth of the city, as the treacherous Parthians would fain have him do; he does not yet perceive her approach, but the position of each figure is favourable for your purpose; let us have them as they now appear.

Your third picture shall be one of glad

triumph—alas, that it must be the only one of that character. Woe, woe for Herod! Few and fleeting were the moments of happiness permitted to brighten that storm-tossed life. This is the last.

The scene is Samaria, the event to be delineated is the marriage of the Tetrarch with his long-loved Mariamne. How radiant was her beauty you well know, and the joy of the hour has restored a portion of their early splendour to the looks of Herod. The gorgeous accompaniments of these espousals do not need description; you are familiar with their details, they are such as befit the regal state of the affianced, and all is brilliant festival. One face alone has turned a look of menace on the bride, but there is a world of evil in that glance; half concealing its malignant fire beneath the sheltering veil, it yet glares balefully from the glowing eyes of her who was soon to become the evil genius of the wedded pair. This is Salome, the sister of Herod; even now is she preparing a heavy future for the hapless Mariamne, and of one among the earlier results of that fiend-like woman's influence shall be the fourth picture in your series.

Evening is falling over the shadowy palm-trees of the Royal Gardens; the fervid evening of an eastern clime. It is the feast of Tabernacles, and after a day of high revelry the brilliant guests are gathered about the fountains. A youthful band surrounds the sparkling waters in that ample basin, and Aristobulus, the young brother of Mariamne, not then eighteen, and described as a very miracle of beauty, has been persuaded to join them, as they plunge beneath the crystal lymph: together have the young men entered that unwonted bath, luxuriously are they disporting themselves in the delicious coolness—all is joy and exultation.

Now you will remember that the criminal ambition of Alexandra has imposed the burthen of the high priesthood on those young shoulders; but Aristobulus recked little of his unbecoming dignities; gaily has the princely boy borne his part in the festival, and joyously have the peals of his laughter rung forth on the well-pleased ear of his mother and sister, as they recline at a distance beneath the sheltering trees.

But there is treachery in that seeming sport. Salome has taken part with those who have led Herod to believe the youth dangerous to his power: perhaps he was so, in the hands of the designing Alexandra, but he will menace no more. The young companions are full of playful gladness; each labours to plunge the other beneath the waters; loud are the cries of ecstasy as the revels go on, but all who gather round Aristobulus are not his friends; surely, they keep him too long immersed! Alarm succeeds to merriment, there is a rushing and tumult; they have laid on the dark soft bordering turf a white inanimate form; you cannot see wherefore that marble stillness, for you are distant, but the agony of Herod, not all feigned, tells too clearly what has chanced. Doth not the Tetrarch rend his garments?—then Aristobulus is dead! and the unhappy son of Antipas has made a further descent adown the precipitous path to that gulf of crime which now yawns inevitably before him. Alas for Herod!

Years of fearful violence succeed, each marked by the searing effects of frequent crime and varied suffering. Deeply has King Herod dyed his hands in kindred blood; Hyrcanus, the grandsire of his bride, and Joseph, his father's brother, have followed Aristobulus. The latter had revealed to Mariamne the command of her husband, that in the event of his death she should not be permitted to survive, and when that became known to Herod he "was like one distracted, his anger made him stark mad; leaping from his couch he ran about the palace wildly, resolved on the destruction of Joseph, at which time his sister Salome took the opportunity and so moved him against Mariamne that he commanded to slay her also, but revoking that order out of his exceeding love for his wife, he caused Joseph to be put to death alone."*

But her escape was not to be for long; proud and resentful, the unfortunate Mariamne took no measures to conciliate her enemy; other charges succeeded, and she was at length brought to trial; the accusations against her were adultery and attempted murder, of both which it was known certainly, that she was innocent.

Here, then, is the melancholy scene you have next to depict. His councillors have assembled by command of the king, and before them is arraigned the wife he still so dearly loves. She is condemned, for so do those unworthy judges believe to be the will of their master. "A woman," says Josephus, "of excellent character both for chastity and greatness of soul; if she wanted moderation and had too much contention in her nature, yet was she endowed with many great and fair gifts; her beauty and majestic appearance surpassed whatever can be said to describe them, and the charms of her conversation were even more powerful than her beauty in the influence they gave her over Herod."

You behold then the kind of woman whom you have now to present to the future ages; no longer the brilliant bride, she is something infinitely more touching, more sublime—she is a faithful wife, a good mother, and a deeply wronged woman; so will you depict her. Her sentence she hears with calmness, for life has long been a weary load, but the serenity of her aspect is for one moment troubled; it is when her worthless mother, Alexandra, whom you perceive to be addressing her with flashing looks, affects to overwhelm her with reproaches, and is daring to express a belief in the truth of those who accuse her daughter, although none can be more firmly assured of Mariamne's innocence than is Alexandra.

By this act the wretched woman, tempted thereto by a mean terror for her own life, ensures the contempt of all who witness it. Even Cyprus, the mother of Herod, and no friend to Mariamne, yet regards the raving Alexandra with abhorrence; she might even be led to plead for the condemned, although she, too, as well as Salome, has but too frequently felt the scorn of the proud Hebrew princess, to whom her Idumean birth was an offence and a stumbling-block; but her daughter is at hand; no ruth is in the heart of the vile Salome; she marks the anguish of her brother, she beholds him on the point of relenting, but the name of Sohemus escapes her lips, that sound has re-kindled all his fury, and Mariamne is led to death. Fearful is now the misery endured by Herod: not this the splendid Ethnarch of the Sanhedrim; the rejoicing bridegroom of Samaria; nay, the figure of the king, as you must now delineate him, shows clearly that much has been performed and suffered, much of wrong-doing and its retributive sorrow, since last we met him at the Feast of Tabernacles, although the brightness of his pristine glory had even then departed.

The unworthy Alexandra is his next victim; her base abandonment of her child did but serve slightly to prolong her miserable existence, and she dies unpitied; all remembering how the murdered Mariamne "gave her not a word, nor was discomposed at her perverseness, save that out of her greatness of soul she could not but feel concern for her mother's offence, and was grieved to see her expose herself by that unbecoming violence."* Thus Alexandra knew herself to be the object of universal scorn.

The Idumean Costobarus followed Alexandra, with Gadias, Dositheus, Lysimachus, and others, until the sword of the tyrant had at length left him no friends to share his woes.

Next there conspires with Salome the first-born of Herod, even Antipater, the son of his Idumean wife Doris; their object is to ruin the two sons of Mariamne, Alexander and Aristobulus, and by their machinations these young men are brought to a deplorable end. But as if it had been decreed that no evil thing should chance without the agency of the doomed king, it is by himself that his sons are arraigned before Cæsar, and even after they have been acquitted by the tribunal of the Emperor, it is by his own

* See "Wars of the Jews," b. i., c. 11, sect. 8.

† "The manner of that death is related on this wise: refusing to abandon Hyrcanus, who, as well as himself, had been lured into the power of the Parthians by false pretences, Phasaelus, who might else have escaped, was straightway bound. He then tried to dash his head against the walls of his prison, but his bonds prevented him from striking an effectual blow, and a physician, subsequently sent to tend him, put poison into the wound. Of this it was that Phasaelus died, but, being aided by a certain woman, he found means to send an account of the whole to Herod, saying, 'Now shall I die content, since my brother will avenge my fall.'"—Antiq., b. xiv., c. 13, sect. 10.

* Wars, b. i., c. 22, sect. 5.

* Antiq., b. xv., c. 7, sect. 5.

voice that they are condemned. They receive the pretence of a trial, at Berytus, and this concluded, those ill-fated descendants of the noble Maccabees are taken to Sebaste,* where both are strangled.

Then it was that the old soldier Tero, Herod's last remaining friend, broke into his presence, declaring that "Truth had perished from the earth, and justice been taken from among men." "I am not able to endure these evils, O king!" exclaimed the veteran warrior, "and have resolved to devote this day, which thou wilt assuredly make my last, to one more and final attempt at causing thee to hear of things as they are." The old man then proceeded to describe the evils that must result from the course pursued by the king, who seemed for some moments disposed to listen: but Tero was ultimately east into prison, and being subsequently accused of conspiring against his master, he was stoned to death at Berytus, as was his son, who had been involved in the accusation. †

And now why continue this melancholy series of pictures? why further dwell on the vast amount of wasted blessings and misapplied endowments that might have rendered the life of this lost king so glorious?—nay, but even to these our days, some lessons may be taught by the story: here however is its end. His days draw to their close, and thus does he approach it. Pheroras, the last beside himself now remaining, of Antipater's four sons, and Herod's well-beloved brother, is accused of designs against his life, the women of his household are tortured into admissions of guilt which is not believed to have had existence, but Pheroras finds means to clear himself: he is nevertheless commanded to leave the capital and retires in bitter resentment to his Tetrarchy, where he subsequently falls sick unto death. Then revives all the old affection of Herod, whose love for his brethren was among the most powerful impulses of his nature, and he hastens to the couch of the dying Pheroras.

Here then will we meet him for the last time. The mere wreck of his former self, he bends sorrowfully over the couch of the sick man, who had registered a solemn vow to see his face no more, and had refused to return to the presence of the king when Herod had himself been at the point of death. Yet has Herod come hither uncalled and unwished for—nay, the pale face of Pheroras wears an expression of reproach, heart-breaking to the wretched brother, who is at this moment repentant. A woman is kneeling beside the bed, it is the wife of Pheroras, grief and terror are in her looks, she is conscious to a guilty knowledge that poison had been prepared for the king, but it is by the wicked Antipater, who has caused it to be brought from Rome by his freed-man Bathyllus, nor has there ever existed any intention on the part of Pheroras to use the drug against his brother. He has indeed supplied her unhappy self with a portion thereof, as a means of escape from the anticipated cruelties of the king, when he shall himself be laid in the grave. These things are made known after the death of Pheroras, and when the fears of his wife have caused her to attempt self-destruction. But we pursue the grievous theme no further, already has that "fire which glowed in him slowly," as says Josephus, commenced its ravages, and his remaining days are to pass in maddening torture. Even now, you have small trace of the stately monarch we formerly knew: that ruined form bent over the couch of Pheroras gives evidence of suffering more terrible than that of the dying.

In his last paroxysms, Herod commanded the death of the wicked son of Doris, even Antipater, whom he already held in bonds. Presuming to indulge in rejoicing anticipations of his father's approaching death, the words of his first-born are repeated to Herod, and the result we have related. Five days after the execution of Antipater, Herod himself departed. ‡

* Our readers will remember that when Herod had strongly fortified Samaria, the name of the city was changed, and it was thenceforth called Sebaste.

† Antiq., b. xvi., c. 14, sects. 4 & 5.

‡ To be continued.

BRITISH INDUSTRIES.*

No. VIII.—THE WHITBY JET AND AMMONITE ORNAMENTS.

THERE are not many branches of Art-manufacture which are of more interest than the working of JET. The material itself—which is a comparatively rare production—being confined in this country to the neighbourhood of Whitby, is curious in its general character, and peculiarly interesting in its mode of occurrence.

Jet was certainly known to the Romans, and used by them for ornamental purposes. A few fragments of jet ornaments which have from time to time been discovered in this country, prove that it was worked at an early period in these islands. The jet of our coast was known to the ancients by the name of *gagates*. In the history of Whitby, by Lionel Charlton, we find this passage—"I myself have lately viewed the earring of a lady, who had most certainly been buried in one of the *houes* (tumuli or barrows) long before the time of the Danes in England. It is of jet, more than two inches over, and about a quarter of an inch thick; made in the form of a heart, with a hole towards its upper end, by which it has been suspended to the ear: it lay when found in contact with the jaw-bone." Ornamental articles have probably been manufactured from the jet of Yorkshire from the earliest historic times; and during the period of monastic rule, especially when the Abbey of Whitby was a seat of learning, and the resort of pious pilgrims, there cannot be much doubt but that jet-crosses and rosaries were common. A good specimen of a jet crucifix of ancient manufacture is in the possession of Mr. John Robinson, of Gros-mont. In the time of Elizabeth it is certain that this manufacture was carried on, since affixed to a deed dating April, 1598, we find the name, "John Carlile, of Whitby, *jet worker*." This manufacture appears, however, to have declined, if it did not, indeed, entirely cease, and it was not until 1800 that we have any further information of this branch of industry. The rise and progress of the jet trade from this period is interesting, and from a local journal we extract the following particulars: "About the year 1800 a painter named Robert Jefferson, who is still living (1854), and one John Carter, who kept a public-house in Haggsgate, a native of Bedale, and who is often spoken of by the name of Katterfelto, in consequence of having married the widow of Gustavus Katterfelto (a Prussian who delivered lectures on science in the Town-hall, Whitby), began to make beads and crosses of jet with files and knives. A neck-guard, made in this barbarous manner, was sold for 17. 1s. A short time afterwards Captain Fremlett, a naval pensioner, came to reside at Whitby, who, stopping in Carter's house, observed Jefferson and Carter pursuing the art in its rude state. He showed them some amber beads, which he had turned with a lathe, and said he would ask some turner if jet could not be turned in the same way. The trio went to one Matthew Hill, who had the workshop lately occupied by Mr. Thomas Horsman. Hill succeeded in making beads, but had no confidence that the art could be pursued to profit. Fremlett, however, agreed to pay him his wages as a turner if he would work for him in the making of jet ornaments. Subsequently Mr. Thomas Yeoman, silversmith and druggist, in Bridge Street, employed Hill's whole time in the manu-

facture; and, business increasing, one Frederick Ward, who had been taken by the abovementioned Carter, out of Leeds poorhouse, to assist him in his inn, went to work with Hill. Mr. Yeoman afterwards employed Foster, another turner. Others then entered the ranks—the next being George Harrison, a cartwright of Sneaton, who was taught by Jefferson. One Charles Brown, of Scalby Mill, near Scarborough, then commenced, and a lad named Wormald served his apprenticeship to him; since which the trade has gradually increased, and by the exertions of Mr. Thomas Andrew, now jet-ornament manufacturer to her Majesty, Mr. Isaac Greenbury (who has had the honour of an order for bracelets for the Empress of the French), with others who have adopted the jet-manufacture as their vocation, the art has arrived at its present excellence, and the trade to its present extent." Learning that this homely account of the rise of the jet-manufacture was strictly reliable, we have thought it advisable to transfer the paragraph entire to our pages. A very important industry has been created from very small beginnings, it has been steadily extending itself, and, notwithstanding the manufacture of cheap imitations of jet in glass, papier-mâché, shell-lac, and Cannel coal, the real material still keeps its position, and from the beautiful polish of which it is susceptible, and the intensity of its blackness, it is not likely to be superseded.

The origin of jet must still be regarded as a matter of doubt. In many respects jet has the characteristics of amber so closely, as to warrant us, from the analogies, in supposing them to have a similar origin. But this idea will not satisfactorily hold, when all the conditions under which the jet is found, are considered. Most of the local authorities who have carefully examined the subject, ascribe to jet a vegetable origin. Young, in his "Geology of the Yorkshire Coasts," says—"The principal repository of jet is the main bed of alum shale, but it is not limited to the aluminous beds. We found some of it in the *second shale*, near Torrington, and it has been often found in the same bed at Malton. Even the sandstone sometimes contains it, though in that matrix it is rather in the form of anthracite, holding a kind of intermediate station between the best jet and coal. Much of this anthracite coal is found in the sandstone cliffs near Whitby, and along the coasts." This writer, in his "History of Whitby," writes—

"Jet, which occurs here in considerable quantities in the aluminous bed, may be properly classed with fossil wood, as it appears to be wood in a high state of bituminisation. Pieces of wood, impregnated with siliceous matter, are often found completely encased with a coat of jet about an inch thick. But the most common form in which the jet occurs is in compact masses of from half an inch to two inches thick, from three to eighteen inches broad, and often ten or twelve feet long. The outer surface is always marked with longitudinal striae, like the grain of wood, and the transverse fracture which is conchoidal, and has a resinous lustre, displays the annual growth in compressed elliptical zones. * * * Many have supposed this substance to be indurated petroleum, or animal pitch, but the facts now quoted are sufficient to prove its ligneous origin."

It does not appear to us that the "ligneous origin" of jet is by any means established—indeed we think the bulk of evidence is against it. There is no evidence, as far as we can learn, of any discovery of

* Continued from p. 68.

true jet having a strictly ligneous structure, or showing anything like the conversion of wood into this coal-like substance. There appears, however, to be some confusion in the observations of those who have written on the subject. Mr. Simpson, the intelligent curator of the Whitby Museum, who has paid much attention to the subject, says, "Jet is generally considered to have been wood, and, in many cases, it undoubtedly has been so; for the woody structure often remains, and it is not unlikely that comminuted vegetable matter may have been changed into jet. But it is evident that vegetable matter is not an essential part of jet, for we frequently find that bone, and the scales of fishes has also been changed into jet. In the Whitby Museum there is a large mass of bone, which has the exterior converted into jet for about a quarter of an inch in thickness. The jetty matter appears to have entered first into the pores of the bone, and there to have hardened; and, during the mineralising process, the whole bony matter has been gradually displaced, and its place occupied by jet, so as to preserve its original form." After an attentive examination of this specimen, we are not disposed to agree entirely with Mr. Simpson. Jet certainly encrusts a mass of matter, which has something of the structure of bone, but, without a chemical examination of its constituents, we should hesitate to say it was bone. Wood without doubt has been found *encrusted* with jet, as fragments of animal matter may also have been. But it is quite inconsistent with our knowledge of physical and chemical changes, to suppose that both animal and vegetable matter would undergo this change. By the *process of substitution*, we know that silica will take the place occupied by carbon, or woody matter; as, for example, in the fossil palms of Trinidad, and the silicified forests of Egypt; but we have no example, within the entire range of the coal formations of the world, of carbon taking the place of any of the earths.

Jet is found in plates, which are sometimes penetrated by belemnites. Mr. Ripley, of Whitby, has several curious examples,—two plates of jet, in one case, enclose water-worn quartz pebbles; and in another, jet partially invests an angular fragment of quartz rock. "This is the more remarkable," says Mr. Simpson, "as quartz rock, or, indeed, any other sort of rocky fragment, is very rarely found in the upper lias."

The very fact that we find jet surrounding belemnites, casing adventitious masses of stone, and investing wood, seems to show that a liquid, or, at all events, a plastic condition, must at one time have prevailed. We have existing evidence of this. Dr. Young, in the work already quoted, says:—"In the cavities of nodules containing petrifications, we sometimes meet with *petroleum*, or *mineral oil*. When first exposed, it is *generally quite fluid*, and of a dark green colour; but it soon becomes viscid and black, and at last hardens into a kind of pitch, which readily melts with heat, and, when ignited, burns with a crackling noise, and emits a strong bituminous smell." One more sample of evidence in favour of the view that jet has been formed from wood. It is stated ("Reed's Illustrated Guide to Whitby") that in front of the cliff-work of Haiburne Wyke existed a petrified stump of a tree, in an erect posture, three feet high, and fifteen inches across, having the roots of coaly jet in a bed of shale; whilst the trunk in the sandstone was partly petrified, and partly of decayed sooty wood. Even in this example it would appear, that after all, a coating of jet was

all that really existed upon this example of the Equisetum, which probably stands where it grew. Mr. Simpson, in a valuable little publication, "The Fossils of the Yorkshire Lias described from Nature; with a Short Outline of the Geology of the Yorkshire Coast," says:—"From all we know respecting this beautiful mineral, it appears exceedingly probable that it has its origin in a certain bituminous matter, or petroleum, which abundantly impregnates the jet-rock; giving out a strong odour when it is exposed to the air. It is frequently found in a liquid state in the chambers of ammonites, and belemnites, and other cavities; and, whilst the unsuspicious operator is breaking a lias nodule, it flies out and stains his garment. * * * * This petroleum, or mineral oil, also occurs in nodules which contain no organic remains; and I have been informed by an experienced jet-miner, that such nodules are often associated with a good seam of jet, and are therefore regarded as an omen of success." The readers of the *Art-Journal* will now form some idea of the difficulties which beset those who would account for the formation of jet.

Having in the most obliging manner been allowed by Mr. Simpson to examine all the specimens in the Whitby Museum, especially those to which he himself refers in his work, we are quite disposed to think that bituminous matter, separating from the alum shale during the process of consolidation, has distributed itself between the laminations of the shale, and insinuated itself into all the cavities, formed by pieces of wood or stone which had been involved in the alum mud. The layers of jet are often not thicker than the edge of a knife; and they seldom exceed, indeed, rarely, are found of, two inches in thickness. These are not, therefore, the conditions belonging to any vegetable formation; but, just such as would prevail, if bituminous matter had gradually filtered through mud, slowly consolidating, and assuming a state of lamination.

The process of mining for jet is rather one of quarrying; although some judgment is required, in order to determine the direction in which the search should be prosecuted. The best jet is obtained from a lower bed of the upper lias formations at Whitby. This bed has an average thickness of about twenty feet, and is known as the jet rock. An inferior kind, known as soft jet, is obtained from the upper part of the upper lias, and forms the sandstone and shale above it. The production of jet seems to be limited along the coast of Yorkshire, from about nine miles south of Whitby, to Boulby about the same distance to the north, the estates of Lord Mulgrave being especially productive. There is a curious allusion to this in the Poly-Olbion of Drayton:—

"The rocks by Moulgrave, too, my glories forth to set,
Out of their crannied rocks can give you perfect jet."

Jet is also obtained in the district extending from Roserdale, near Pickering, to Bilsdale. There is, indeed, every reason for believing the jet-deposits will accompany the peculiar rock in which it is found at Whitby, wherever that formation may extend.

Collecting jet is attended with some danger; since working upon the edge of the cliff, the men are obliged to expose themselves in very perilous places. In a paper now lying before us, we see recorded the death of a labourer in the jet-works at Kettleless, who was killed by a fall from the top of the cliff. He fell upon a piece of broken rock, and was killed on the spot.

The number of people employed in the several branches of industry connected with jet at Whitby, or dependent upon it for their support, has been estimated at a thousand. The population of Whitby does not greatly exceed ten thousand; so that nearly one in ten of the population rely on this special manufacture. Raw jet varies in price according to its quality; soft jet being sold for two shillings the pound, whereas the best varieties of the hard jet will fetch twelve shillings the pound. There are about twelve manufacturers of jet in Whitby; the principal ones being Mr. Isaac Greenbury, Mr. Thomas Andrew, and Mr. Wright. The value of the manufactured jet was, last year, somewhere about twenty thousand pounds. All the best examples of the manufacture find their way to the metropolis; while a very large trade, especially in the less valuable varieties, is carried on with the United States of America.

Since jet manufacture has been almost entirely confined to the purposes of ornament, and those ornaments such usually as can be worn only in seasons of sorrow, there are no very extended limits for the art of the designer. Necklaces, ear-pendants, brooches, and articles of a similar description, have a somewhat stereotyped character; but still we cannot but think that a considerable value might be given to this manufacture, if some skilled designers, acquainted with the peculiarities of the material with which the maker has to deal, turned their attention to the material. It appears that the more spirited of the manufacturers of jet have offered prizes for, and have endeavoured to adopt many new designs. But owing to the fact that the artist has not been a manufacturer, the designs furnished have not been generally applicable. In this, as in other departments of Art industry, it is necessary that the power of the artist, and the skill of the manufacturer, should be united. It would be of the utmost advantage to the town of Whitby in which, what may be regarded as a new manufacture, is developing itself, if means were taken for the establishment of a school of design, in which there should exist a class, whose sole study should be the construction of forms, which should combine all that is elegant in design, with adaptability to the beautiful material in which it was to be worked. An intelligent jet manufacturer informed us that very few of the designs which he obtained by purchase from the metropolis could be worked; that they were far more successful in their attempts to copy from natural objects, than from any artificial combination. In the large collection of jet ornaments manufactured by Mr. Greenbury, we saw many examples of copies from nature, which were very perfect as copies, and exceedingly beautiful as ornaments. We were much pleased also with some examples in jet from ancient brooches, and copies in jet from works of superior excellence in gold. Notwithstanding many satisfactory examples of this kind to be found in the collection of Mr. Greenbury, we know he is fully impressed with the advantages to be derived from the introduction of some Art-education. It appears that he frequently avails himself of the designs published from time to time in the *Art-Journal*, but still the necessity for a good designer in jet was freely admitted.

Jet manufacture must be regarded as in some measure the staple of Whitby. Long celebrated for its ships, ship-building still takes precedence of every other industry; but next to it comes the jet, so peculiarly associated with this locality in nature.

The Ammonites—of which fossil no less than one hundred varieties have been found around Whitby, and described by Mr. Simpson—are characteristic of the lias rocks of this neighbourhood. These are the well-known "snake stones" of popular tradition, rendered familiar by the verses of Scott in "Marmion":—

"They told how in their convent cell,
A Saxon princess once did dwell,
The lovely Edelheid,
And how, of thousand snakes, each one
Was changed into a coil of stone,
When holy Hilda prayed."

These Ammonites are found in the greatest abundance, of all sizes, and, as we have said, of numerous varieties. These are mounted in gold and silver as brooches and pins, and are eagerly sought after by the curious; forming, at the same time, most elegant ornaments, and instructive examples of one of the forms of life which had existence upon this world ere yet man had being.

Such are a few of the peculiarities of the natural productions, found within a limited area, from which have grown an important industry, still capable of considerable extension.

ROBERT HUNT.

THE NATIONAL GALLERY AND ITS DEFAMERS.

"He defied any one to point out any artist who could have been appointed to the situation, who would not have been immediately a butt for the anonymous attacks of every disappointed competitor." These are the words of Lord Palmerston in the House of Commons, during a debate on a motion moved by Mr. Otway, and seconded by Mr. Harcourt Vernon; which motion was intended to show that Sir Charles Eastlake is entirely unfitted for the position he occupies, as Director of the National Gallery; a motion that was rejected by 152 against 72. Mr. Otway in reply said, that "the House was not dealing with anonymous slanders, but rather with the criticisms of the most eminent journals in the empire; every magazine of character; every newspaper worth anything; nay, more; the very gentlemen who had been appointed by the government to high office—Mr. Hurlstone, President of the Society of British Artists, and Mr. A. Stevens, the Gold Medallist—had commented with severity on the proceedings and purchases of Sir C. Eastlake."

The two passages we have quoted contain pretty nearly all that is to be said—for and against—concerning the recent attacks upon Sir Charles Eastlake, and those with whom he is allied in the executive of the National Gallery; and Lord Palmerston very well knows, that if it were possible to collect the knowledge of all who have ever lived, and condense it into "one small head," that head would as surely be "a butt for disappointed competitors," as Sir Charles Eastlake has been.

But, with respect to Mr. Otway's statement; it is as fair a specimen as could be had of the nature and style of this discussion—a bold assertion unsupported by fact. We deny *in toto* that every magazine of character, every newspaper worth anything, has commented with severity on the proceedings and purchases of Sir Charles Eastlake. We are fully aware that in several periodical works, attacks of this kind have been made; but they all, or very nearly all, issue from the same source; and may be traced to one of four persons—Mr. William Coningham, Mr. N. T. Walter, Mr. F. Y. Hurlstone, and Mr. A. Stevens. With regard to the two latter, whom Mr. Otway describes as "the very gentlemen who had been appointed by government to high office," and who in so describing them exhibits the accuracy of his information, the public know the one as President of the Society of British Artists—that is his "high office" to

which he has been "appointed by the government;" but, of the Society and the office it can only be said, that neither the one nor the other is calculated to give weight to any testimony concerning Art; nor has Mr. Hurlstone ever supplied a solitary proof of his fitness to judge of pictures, or of the capabilities requisite in a Director of the National Gallery. The "high office" to which "government has appointed" Mr. Stevens, we imagine to mean one of the junior masterships of the Government School of Design; but, as to what are his qualifications as a public guide in this matter, we are as ignorant as we believe Mr. Otway to be. He boasts, indeed, of his long residence in Italy; it appears he spent his youth in Florence, whither he was carried as a boy. "Mr. N. T. Walter" is a pawnbroker living in Goswell Road; we may judge of the value of his cool and considerate testimony, who asserts that "the Eastlake-Wornum-Mündler Paolo Veronese, an extremely damaged, vamped-up, and originally bad picture, is not worth two pence." If we know but little of Mr. Walter, we know too much of Mr. Coningham: for many years past this gentleman has perpetually assailed the management and condemned the purchases of the National Gallery, and will continue to do so until Mr. William Coningham is made Director thereof. This is as simple a truth as that two and two make four. If the Trustees would but effect this easy change, they would save themselves much vexation and annoyance: all things would then go right; there would be no confusion; no ruinous picture-cleaning; no jobbing of any kind; and the nation would be at once convinced that—"the right man being in the right place"—Parliament would be only troubled to make annual grants; and that Mr. William Coningham, assisted, perhaps, by Mr. Hurlstone, Mr. Stevens, and Mr. Walter, would "do all the rest."

In treating this case—which Mr. N. T. Walter has so gracefully described as the Eastlake-Wornum-Mündler job—and the judgment of the public concerning which depends so mainly on his "opinion"—regard must be had to the "previous character" of the accused as well as the accusers.

Of Herr Mündler we know little: he is a German of high repute as a judge of pictures; of large experience; a good linguist; and, perhaps, on the whole, as valuable an ally as could be found as "travelling agent;" whose information as to when and where pictures are for sale, and whose services in the negotiation of such sales, are to be made available by the Director. We believe his duty does not extend beyond this; and for such a post, a familiarity with foreign languages is indispensable.*

Mr. Wornum, the Keeper and Secretary, is, beyond doubt, a gentleman of extensive knowledge concerning Art; to say nothing of the "high office" to which he was "appointed by the government" in the School of Design, he may be judged by evidence far less fallible—his published writings. These are *authorities*; and prove beyond controversy, that few men living have seen more of, or thought more about, the works of the ancient masters: he is a scholar, a gentleman, a critic, and a man of letters, and singularly well fitted for the post he occupies—that of *Secretary* to the National Gallery. He, too, has resided many years abroad.

With regard to Sir Charles Eastlake very little need be said: no one disputes his capabilities as a scholar; no one doubts that he has derived large experience from a lengthened residence in Italy, and frequent visits to the Continent; all admit his merits as a painter; and none question, even for a moment, his high integrity,

his unblemished honour, or his earnest aim to do in all things right. If Sir Charles Eastlake stood in need of "testimonials," he might obtain them upon all these points, not only from the purest of all sources at home, but from every man of learning in Art and letters abroad: we would undertake to back his claim to the Directorship of the National Gallery by a thousand "opinions," every one of which should have more weight than that of Mr. William Coningham.

For the present we shall content ourselves with quoting some three or four passages from the Report of the Debate in the House of Commons, which forms the ground of this article.

The Lords of the Treasury in their minutes of March 27, 1855:—"My lords propose to appoint a director of the National Gallery, with a salary of 1,000*l.* per annum, such appointment to be for a term of five years, but the director to be eligible for re-appointment, which appointment, however, may be at any time revoked by the Treasury. My lords consider it a fortunate circumstance that they are able to select for the first appointment to this important office a gentleman of such high attainments as Sir C. Eastlake, who is president of the Royal Academy, and has shown qualifications of the highest order for the office."

Mr. Harcourt Vernon, who seconded the resolution of Mr. Otway, and who did not wish to see Sir Charles Eastlake Director to the National Gallery, said—"In Sir C. Eastlake the government had found a gentleman, and a man above all sordid considerations. He was a person of great refinement, and of considerable pictorial knowledge."

Mr. T. Baring:—"The trustees were unanimous in thinking that the management of Sir C. Eastlake had been most satisfactory up to the present time; and they were happy to see in the National Gallery a director of knowledge, taste, and discretion, and upon whom perfect reliance might be placed."

Mr. Otway "knew Sir Charles Eastlake to be an honourable man, and an excellent artist."

Lord Palmerston:—"With regard to Sir Charles Eastlake, he had no hesitation in concurring in the previous determination that he should be the director; because his high character, his great knowledge of Art, and his professional ability as an artist, pointed him out as undoubtedly fit to hold the office intrusted to him."

With such "testimonials" as these, Sir Charles Eastlake may safely leave unnoticed the sneers, sarcasms, calumnies, and insults, he receives from "disappointed competitors." It would be, indeed, a public calamity, an outrage on common sense, and an irreparable injury to Art, if this gentleman "above all sordid considerations," on whom "perfect reliance can be placed," who has "shown qualifications of the highest order for the office," and who is pointed out as undoubtedly fit to hold the office entrusted to him, because of "his high character, his great knowledge of Art, and his professional ability as an artist," should be displaced by a person who has no solitary claim to the appointment, except that he "talks big"—

"Makes gallant show and promise of his mettle;"

whose sole merit is derived from the simple process of abuse; and towards whom no party or person has, as far as we know, ever expressed a particle of confidence, for any one of the qualities so universally attributed to the President of the Royal Academy.

In this article we have to do only with vague assertions, or with "opinions" entirely unsupported by the semblance of facts. Nay, there is one fact undoubtedly;—Sir Charles Eastlake admits that he was deceived in the case of the spurious Holbein; and in a speech, to say the least of it, most ungenerous, Mr. Otway is reported to have said, *therefore* Sir Charles Eastlake has himself admitted his unfitness for the office of Director of the National Gallery. We should like to know which of the connoisseurs, in or out of Parliament, will "cast the first stone?" what buyer of "old masters," no matter how large may be his knowledge or experience,

* "He had seen Mr. Mündler in some of the towns of Italy, and that gentleman appeared to be an extremely painstaking and laborious person, and he had heard his opinion with reference to pictures very favourably spoken of by competent persons. He also—though his opinion might be worth very little—was favourably impressed with what he saw of Mr. Mündler."—Mr. Harcourt Vernon, seconder of Mr. Otway's motion, in the House of Commons. Mr. Stirling, in the House of Commons:—"Two or three years before Mr. Mündler received his present appointment, he heard him mentioned by several artists in Paris as a person remarkable for his honesty and integrity."

has never been taken in; and that, when his own money was to pay the price of a deception. If Mr. Otway wishes for easies in point, we can ourselves supply him with a score or two, of dealers, collectors, connoisseurs, and amateurs, who have been occasionally the victims of clever rogues, who buy, and sell, and manufacture pictures.*

This is the only "fact" upon which are based the arguments of Mr. Otway, and those by whom the honourable gentleman has been instructed. Mr. William Coningham has indeed printed in a Morning Newspaper a letter—of which he has extensively circulated copies—extending to three columns; in which we cannot find a single other fact, or the semblance of a fact.† We find indeed some thirty or forty assertions—such as these: "a disgrace to the National Gallery, and spurious," "a commonplace work of a degenerate school and of doubtful origin," "ignoble in character, and spurious;" "a scandalous purchase," "utterly unfit for study," "useful only as a beacon what to avoid," "a libel on the painter to whom it is ascribed," &c. &c.

If we are to believe Mr. Coningham—which assuredly we do not—Sir Charles Eastlake, either because of his ignorance or of his dishonesty, or both, has been invariably taken in: he has been either the victim or the ally of all the chief picture-swindlers of the age; he has betrayed his trust, degraded his country, and ruined Art.

Consequently, inasmuch as, by a Treasury minute, "the appointment of the Director may be at any time revoked by the Treasury"—"if the Treasury deal honourably by their trust, they will at once revoke that appointment."

So thinks, or so says, Mr. William Coningham; but the Treasury is supplied with no *proofs* except the said Mr. William Coningham's *opinion*. The writer well knows that, with no better evidence, no jury would convict a ticket-of-leave man accused of attempt at burglarious entry. Will the public find it difficult to believe that if Mr. Coningham had a single *proof*, he would have hesitated to adduce it? Is it not quite certain that he has sought for proofs—in books from buyers and sellers, from dealers at home and abroad—in short, that he has ransacked every possible source by which to sustain his assertions—and now, as ever, without procuring one? This consideration alone gives to Sir Charles Eastlake a triumph on which he may be congratulated; he has been, to our thinking, over and not under cautious; it is, we believe (and we regret it) his nature to be so; if he had been more venturesome, he might have been more fortunate in his acquisitions; but he has hitherto passed unscathed through an ordeal—where he was watched at every movement and dogged at every step, and where a moment's departure from the straight path of rectitude would have been ruin.

Concerning the other three newspaper letter-writers, a very few remarks only are necessary.

Mr. Walter—from his "picture-gallery in Goswell Road"—writes in admirable keeping with his calling. He describes the picture, which those ignorant pretenders, Sir Charles Eastlake, Mr. Wornum, and Herr Mündler have bought,

as "damaged, vamped up, and originally bad," and he values it at "two pence:" he does not say how much he would advance upon it if pledged at his shop, but we take it that the utmost sum he would *lend* on such security is *one penny*—without the frame.

Mr. Hurlstone, indeed, tells us "there is strong evidence that 'The Adoration of the Magi' is not by Paolo Veronese." What that strong evidence is he does not inform us—merely because he cannot. If it be "the absence of the best characteristics of the artist," that is opinion—his opinion—and not evidence: it may be taken at its full value, and not be worth much, although Mr. Hurlstone has been appointed to "high office"—that of President of the Society in Suffolk Street—by "the government!"

The letter of Mr. Alfred Stevens is simply an impertinence: a bare opinion—that "'The Adoration of the Magi' is a work of the lowest type of the Venetian school"—is followed by a coarse assertion—that the purchase "is the natural consequence of placing the National Gallery under the control of three such notoriously incapable men as Sir Charles Eastlake, Mr. Wornum, and their 'travelling' adviser, Herr Mündler." Only think! Mr. Alfred Stevens talking to the world of the "incapacity" of Sir Charles Eastlake: a Goliath of Gath slaying little David, and borrowing Samson's weapon for the death-blow. Truly, these four apples swim very prettily.

The world is not now to be told that there is a pretty large class of persons who mistake notoriety for fame, and think they are elevating their own characters by decrying those of others. Some of them go farther, and, believing, with Sir Fretful Plagiary, that "the malice in a good thing is the barb that makes it stick," take especial care never to be without a supply of the article—always ready for use.

These four "letter-writers" have had for some time possession of the public ear: the voice of Sir Charles Eastlake will not be heard in answer. Such adversaries are not to be encountered by such a man; he does wisely in treating them with silent contempt. As little right has he to answer Mr. Otway, Mr. Gladstone, or Lord Elcho, so long as they insinuate, and do not attempt *proof*. In fact, where there is no charge there can be no defence.

But we all know that to create a prejudice is easy: calumny takes rapid root; and it is by no means unlikely that a portion of the public are believing the Director of the National Gallery to be either so ignorant or so dishonest as to have bought all the trash Mr. Coningham says he has bought, and to have let the fine pictures he might have secured pass into other hands.

And this upon such "authorities" as the four persons we have been describing!

We have left ourselves but little space for comment upon the picture—the "Adoration of the Magi," by Paul Veronese, by which has been raised this storm in this puddle. Mr. Walter, as we have said, values it at two-pence: Mr. Bowyer says it is worth 50*l.*, and was offered, "he has been told," for sale some time ago, at that sum; Mr. Otway opines that it would not be appraised by an auctioneer at more than 100*l.*; on the other hand, Mr. Wilson affirms he had seen a letter from Paris in which 2400*l.* had been offered for it. These statements may be taken at what they are worth.

The picture is now placed in the National Gallery, and any one who pleases may see and judge for himself. It is, to our thinking, a fine and valuable work of the master. But, good or bad, useful or useless, of its authenticity no honest man has a doubt. Its history is this—we extract from the blue book.

"*Paul Veronese.*—'The Adoration of the Magi.' In the foreground the Virgin and Child, Joseph, and the three Magi; on the right and above, some peasants. Behind is the retinue of the Magi, some bearing presents, others attending to their horses and camel. A ray of light, with winged cherubs hovering along its course, falls upon the Infant; above is a group of infant angels. Painted on canvas; measure, 11 feet 7 inches high, 10 feet 7 inches wide. Purchased in London, in November 1855, from Signor Angelo Toffoli, of Venice, for 1,977*l.* Engraved by Carlo Sacchi, 1649. On the whole, well

preserved. When the picture was removed from the church in which it had been originally placed, it was folded twice, horizontally. The foldings, which may still be traced in certain lights, occurred, however, in unimportant parts, and have been skillfully repaired.

"This picture, which bears the date 1573, was, about that time, placed in the church of S. Silvestro in Venice. It is mentioned as being there by Sansovino, Boschini, Ridolfi, Barri, Zanetti, and others. The church having required repairs, the numerous works of art which it contained were, in 1837, together with this picture, removed from the walls to a room within the precincts of the building. In the course of the architectural repairs, the internal form of the church had undergone alteration, so that when the pictures were to be replaced, as originally proposed, not one of the larger works could be fitted to the new altars and compartments. After much delay, a papal decree, together with an order from the local authorities, was obtained for the sale of those pictures. In August 1855 they became the property of Signor Toffoli, from whom, as above stated, the Paul Veronese was purchased for the national collection."

Now, these statements are not impugned in the slightest degree by any one of the polite letter-writers by whom the picture has been assailed. Mr. Coningham calls it "a daub:" Mr. Walter describes it as "damaged, vamped-up, and originally bad:" what is said in the *Lancet*, the *Dispatch*, the *Civil Service Gazette*, the *Empire*, the *Church of England Quarterly*, (papers quoted as authorities by Mr. Otway) we cannot tell. The *Examiner*, also quoted by him, has observed—"We should really like Mr. Otway to favour us with a reference to the page of the *Examiner* in which that journal has been found joining in an unprovoked and ungenerous cry against an able artist, and a competent critic of Art." Probably, if we had the means of reference to "every magazine of character, and every newspaper worth anything," which Mr. Otway says has commented with severity on the proceedings and purchases of Sir Charles Eastlake, we should find their comments represented with about the same amount of accuracy as were those of the *Examiner*.

Of this the public may be perfectly sure— notwithstanding the testimony of these four gentlemen—that a high-class work, of one of the greatest of the Italian masters, of unquestionable originality, its history being perfect, has been purchased for the National Gallery at a price not beyond its value.

We ask therefore, with the *Literary Gazette*—at least as safe an authority as the *Lancet*, or the *Dispatch*—if the public "are willing to abandon the guidance of accomplished artists, who have made the practical and literary study of Art the object of their lives, for the opinions of jealous professional men, or of interested jobbers and dealers, whose violent and partial statements are guided by the experience of shops and auction-rooms; and whose critical faculties, always on the stretch to preserve them against fraud, suspect nothing but trickery in every straightforward statement!"

Such insolent and scandalous attacks on public men are public grievances, and it is the duty of the public to protest against them. Where shall it find trustworthy and intelligent servants, if they are to be exposed to such outrages without protection? Neither of the gentlemen thus insulted are dependent on the offices they hold: and the probabilities are that, but for the opinions expressed in Parliament by Lord Palmerston and Mr. T. Baring—nay, by the mover and seconder of the motion to degrade them—they would have resigned in disgust and indignation. Men who do their duty, and have the consciousness of integrity, can bear much; but there is a point at which endurance becomes dishonour. Under present circumstances, retirement from their posts would be discreditable to Sir Charles Eastlake, Mr. Wornum, and Herr Mündler: but it might have been otherwise.

We should find it very difficult—if it were possible—to name three gentlemen better qualified to fill the important offices these gentlemen fill in our National Gallery.

* One may for the present suffice:—No one will doubt the judgment, knowledge, and experience of the late Mr. Hope, more especially as concerned the works of the Flemish school. He purchased a "Rembrandt" for 2000 guineas; upon hanging it up, he found there was some difficulty in getting it easily into the frame, and sent for a common carpenter to ease the panel a little with his plane. Mr. Hope had been telling the carpenter how large a sum he had given for the picture, and how good was its state of preservation, considering it had been painted nearly two hundred years. The simple workman saw at once the error, and observed that was impossible, for the picture was painted on mahogany, and mahogany was not introduced into Europe until some time afterwards. Mr. Hope examined the panel, and saw at once he had been taken in; he burnt the picture immediately: he could afford to lose 2000*l.*, but he could not afford to show the world he had been cheated into a belief that a forged picture was a genuine production of the master. We could also tell a story of a well-known gentleman, of undoubted skill and knowledge, who, having bought a fine example of an early school—painted on copper—discovered, not long afterwards, the names of "Thompson & Smith," stamped on a corner; the painting had sunk into the indented letters, and the fraud was obvious.

† In alluding to the Holbein, Mr. Coningham says, "the notoriety of this production exempts it from comment," and forthwith proceeds to comment upon it to the extent of half a column of the newspaper.

MINOR TOPICS OF THE MONTH.

THE ROYAL ACADEMY.—The exhibition will be opened, as usual, on the first Monday of May. Report speaks of it highly: we have no doubt of its being such as to uphold the reputation of our school. Its principal strength will be derived from the labours of the younger members: members, however, who are not now young. We confess it would give us greater pleasure to learn that among the hitherto "unknown" there was found rich promise of the hereafter. The sculpture-den will be over-full, a considerable number of large works having been sent in: the memorial of the Sculptors' Institute will thus have a practical illustration. The evil might be easily removed by the simple erection of a temporary building for the exhibition of works in sculpture.

THE HANGERS this year at the Royal Academy are Messrs. E. M. Ward, Cope, and Cousins, all of whom, we believe, discharge this onerous duty for the first time. They are gentlemen in whom the public and the profession will confide: but if they were archangels, they would fail to give "entire satisfaction." At all events, let them do the worst they can, they cannot do worse than was done last year in this important matter.

THE LIBRARIAN OF THE ROYAL ACADEMY.—Mr. Uwins has resigned this office, in consequence of declining health, which, we rejoice to know, however, has been much restored of late, although he deems his strength insufficient to enable him to discharge the duties incident to the appointment. The Council has selected in his stead Mr. H. W. Pickersgill, and the nomination has been approved by the Queen.

THE NEW SOCIETY OF PAINTERS IN WATER-COLOURS—being the twenty-second annual exhibition—opened their rooms to the public on Monday, the 21st April,—too late in the month for us to do more than place the fact on record. We shall, of course, review the collection in our next.

THE NATIONAL COLLECTION OF BRITISH PICTURES will be deposited in the gallery now ereciting at Kensington, probably about the end of the autumn of the present year: the museum of the School of Art will occupy the ground floor; the pictures the floor above. It will contain the Vernon Gallery; all the works of British masters the property of the nation; and the pictures become national property under the will of J. M. W. Turner, R.A. These latter will amount in number to between thirty and forty; and among them will be the two grand works at Trafalgar Square. These two pictures were bequeathed by Turner under the express condition that they should occupy places beside the Claudes: they stand so at present in the National Gallery: but this condition has been ignored by the Court of Chancery, and they will be removed to Kensington. The drawings—"all that came from Mr. Turner's hand"—are now at the National Gallery: but it is probable they will go to the British Museum. The Exhibition cannot fail to be deeply interesting as well as instructive; it will be a monument to the great painter even more worthy than that which is to be erected to his memory in the Cathedral of St. Paul.

A MR. BOWYER, who is a member of Parliament for somewhere, has informed the country, speaking from his place in the house, that it "has a sculptor:" the sculptor to whom he refers is the Baron Marochetti. It is truly lamentable to find such utter ignorance existing in the House of Commons whenever Art is considered or discussed; there was no one to rise and set this honourable gentleman right. He is not aware of the existence in England of such men as Baily, Foley, MacDowell, Marshall, Bell, and others—who are in comparison with the one sculptor "now in England" the great masters whom he cannot approach: and if Mr. Bowyer would seek opinions better than his own, he would find that such is the testimony of every school of Europe, wherever the works of British sculptors have been seen. If the honourable gentleman would but examine the statues of Hampden, Clarendon, and Falkland—the works of Foley, Marshall, and Bell—and con-

trast them with the Peel of Marochetti—which he may see at the Crystal Palace, we imagine he will be enlightened as regards this particular class of sculpture, and that his "one sculptor" will dwindle much: we trust he may also have an opportunity of examining the "Bacchus and Ino" of Foley, the "Sabrina" of Marshall, the "Day Dream" of MacDowell, to say nothing of the "Eve" of Baily; and if his eyes be open, we can scarcely doubt his conviction that England has more sculptors than "one." It is an outrage on sense, justice, and patriotism, perpetrated in the House of Commons,—many apathetic witnesses standing by—against which we enter our protest.

TO BRITISH SCULPTORS.—We heartily and cordially rejoice to record the following statement made by Sir Benjamin Hall, in the House of Commons, in reference to the monument which the country is to erect in St. Paul's, in memory of the Duke of Wellington: "It was his (Sir B. Hall's) intention, if the conduct of this business should be placed under his control, to call in the aid, not only of four, but of several artists of the greatest eminence in this country, in order that we might see what the talent of England could produce, and that we might have something worthy of the memory of the great man whom we all desired to honour." This is most encouraging—full of hope! It was stated also that a sum of nearly 25,000*l.* would be appropriated to this high purpose: such sum being the balance remaining out of the amount voted by parliament to pay the expenses of the great Duke's funeral. It will be remembered that the sum fixed was no more than 5000*l.*, and when four sculptors were called upon for models—i. e. Baily, Foley, Gibson, and Marochetti; the two latter refused to compete: the designs of the two former were rejected by Sir William Molesworth: but we may well ask what could have been done for such a sum? and we may add, what may not be done by a sum four times larger! We earnestly hope—nay, we devoutly pray—that in this case there may be no interest covertly at work to prejudice this lofty branch of Art in Great Britain. No event of our time is so pregnant with good—or evil—to the British sculptor: there has been none upon the issue of which so much depends for the honour, glory, and permanent benefit of the country.

THE REPORT OF THE DIRECTORS TO THE TRUSTEES OF THE NATIONAL GALLERY extends to twenty-two pages: it consists of remarks under the several heads—"Report on the purchase of pictures; arrangement of the pictures; description of the pictures; conservation of the pictures; general arrangements; and bequests and donations;" and the information conveyed is remarkably clear and distinct. The Appendix contains a variety of interesting documents with regard to the general plans, the duties of officers, the recent purchases, and so forth. This Report may be purchased by any person for a sum of about one shilling. We do not, therefore, occupy our pages by printing it; but, from time to time, we shall refer to the various matters upon which it comments. Meanwhile, we entirely agree with a contemporary—the *Literary Gazette*—in considering that, "So far as this Report is concerned, we think, there is nothing that the most captious critic can condemn. On the contrary, its clearness, fulness, and simplicity, appear to be the very model of this sort of compilation, where every point connected with the subject is prominently set out, and illustrated with just the sufficient amount of correspondence and precise information in the Appendix."

AN ADDITION TO THE NATIONAL GALLERY has been hung during the past month. It is a Mantegna, of which the following particulars are stated in the Report:—The subject is the 'Madonna and Child Enthroned'; on the right of the spectator, the Magdalene; on the left, St. John the Baptist, both standing. It is inscribed, "Andreas Mantegna, C.P.F." It is painted on cloth, and fastened but not glued to a panel; the medium being tempera, or something "differing in its results" from oil. The picture is from Milan: it has been engraved by Aliprandi, and is described by Selvatico, in a commentary upon Vasari's "Life of Mantegna."

ART-MANUFACTURES.—Scotland, we believe, has the credit of introducing into Britain those societies which, under the name of "Art-Unions," have been the means of circulating through the country, for many years, so large a number of Fine-Art productions, and of extending a love of Art through the empire: from a printed circular which has recently come into our hands, we see she is desirous of promoting a similar movement in favour of Art-manufactures. The prospectus we have received is headed "Association for Encouraging the Application of Fine Art to the Manufacture of Articles of Utility and Ornament." This object, it is thought, may be attained by an extension of the system of Art-Unions, which have already been successful in the encouragement of Painting and Sculpture. It is proposed to have periodical exhibitions of manufactured works, remarkable for beauty of design and execution, and to distribute among the subscribers such of the articles exhibited for sale as may be deemed worthy of being purchased, under the superintendence of a committee annually appointed. These exhibitions it is proposed to hold in Edinburgh, Glasgow, or elsewhere, where encouragement may be given. The objects to be acquired for distribution are intended to be exclusively such as may be properly described as works of Art, and will embrace articles executed in metal, stone, and marble, porcelain, glass, stone-ware, papier-mâché, tapestry, &c. &c.: and in order to secure manufactures of the highest class, it is intended that the committee shall have the power to purchase examples both at home and abroad, and to give commissions for original works, or for copies of existing works of superior excellence. The funds of the Association will be raised by annual subscription, in shares of one guinea each, and by donations. Such is a general outline of the plans of the Association, the object of which has our hearty approval, and there is little doubt it will have the cordial support of every manufacturer of any importance throughout the kingdom. It is, indeed, the manufacturer who will derive the greatest advantage from the operations of such a society, by the encouragement it will give to the production of works of a high class, which, as is now too often the case, are made only to show what he can do, and then are left unsold in his ware-rooms for years. We have frequently heard manufacturers complain that it is of little use to execute articles of a high standard of excellence, as the cost of production almost places them beyond the hope of sale. Another benefit accruing from the society is, that it must materially assist in elevating the public taste with reference to such matters, and so, indirectly, be the means of calling into existence a description of articles, even of an ordinary kind, far superior to those now commonly sent out. The artisan, also, will find a stimulus to his skill and talent by the demand which will thus be created for objects requiring both: and thus all classes will be benefited by the success of this Association, which, we understand, has received the approbation of the Privy Council, and has already a goodly list of subscribers, including many of the leading artists and manufacturers of Scotland, and of persons eminent by their position in society. Earnestly, and—it may be added, we trust, without presumption—not unsuccessfully have we laboured to advance the progress of the Industrial Arts of the country: we rejoice to see such a movement as the present, which ten years ago would never have been contemplated, but which now requires only to be extensively known to be liberally supported.

PUBLIC WORKS AND BUILDINGS.—The estimates recently published include 195,141*l.* for public buildings and royal palaces; 7,868*l.* for additional works in the south portion of Buckingham Palace, for external enclosures, lighting, and warming; 91,684*l.* for royal parks and pleasure gardens; and 99,383*l.* for the New Houses of Parliament. As regards the parks, it is found that to St. James's, the Green, and Hyde Parks are appropriated 25,631*l.*; to Kensington Gardens, 2,716*l.*; to Chelsea Hospital grounds, 750*l.*; the Regent's Park, 6,601*l.*; to Victoria Park, 4,860*l.*; to Greenwich Park, 2,287*l.*; and to the Royal Botanical and Pleasure

Gardens at Kew, 19,078*l*. Under the head of the New Houses of Parliament, Sir C. Barry demands 9,500*l*. for the completion of the Victoria Tower, 7,600*l*. for the clock-tower, and other items, amounting altogether to 52,540*l*.; exclusive of the works not under his direction : 4,000*l*. is to be applied this year to the decoration of the new Palace at Westminster, under the direction of the Fine Arts Commission. The works include Mr. J. Gibson's statue of the Queen and its bas-reliefs, Mr. J. R. Herbert's frescoes in the Peers' robing-room, illustrative of "Justice on earth and its development in law and judgment," and the marble statues of men of eminence (as members of Parliament) in St. Stephen's Hall. The work of Mr. Gibson is nearly completed. Mr. Herbert is about to commence his fresco paintings, and, as regards the statues, commissions for ten, at the cost of 1,200*l*. each for three, and 1,000*l*. each for the other seven, have already been given. The sum of 25,643*l*. has been voted for the British Museum, exclusive of the estimate for General Building Purposes: this sum is apportioned as follows—painting the walls and vaulting of the basement under the Egyptian Gallery, 90*l*.; alteration in the form of the windows of the New Reading Room, and in glazing of the external sashes, 1,413*l*.; area between the main building and the New Greek Gallery, proposed to be roofed over and converted into a place for the public exhibition of Assyrian and other sculptures, total estimate, 4,500*l*.; on account, 3000*l*. For works, fittings, and furniture—in the department of printed books, 12,507*l*. 10*s*.; manuscripts, 1550*l*.; antiquities, 2,788*l*.; natural history, zoological branch, 844*l*.; mineralogical and geological branch, 991*l*. 10*s*.; botanical branch, 124*l*.; prints, 218*l*. 10*s*. Miscellaneous works, 1,726*l*. For professional remuneration to Sir Charles Barry, 390*l*. 12*s*.

A MARBLE STATUE OF "OMPHALE MOCKING HERCULES," the work of JOHN BELL, life-size, is now being exhibited at Dickenson's, 114, New Bond Street. It is emblematic of the triumph of Beauty over Strength. She has taken the club and lion's-skin, and the apples of the Hesperides, held by the Farnese Hercules, which statue she travesties somewhat in her attitude; in fact, she is jesting at her great lover. The statue was in the Paris Exhibition in an unfinished state, but it attracted much attention there. It is now completed, and will be justly ranked among the most meritorious examples of British Art. It will undoubtedly raise the reputation of the accomplished sculptor, whose position is already so high.

THE ARCHITECTURAL MUSEUM.—The two prizes offered by the committee and Mr. Ruskin have been awarded "for the best carvings in wood and stone." On the occasion of their presentation, several distinguished gentlemen were present, Professor Cockerell, R.A., in the chair. Other prizes were offered, and several speakers addressed the assembled workmen, explaining that one of the chief objects of the museum was the encouragement and "individualisation" of the Art-workman of the present day, by offering to him a prize for the produce of his own invention and skill.

THE BRITISH INSTITUTION.—We rejoice to find a very large number of pictures have found purchasers. We had prepared a list for publication, but are compelled, from want of space, to postpone it till next month, when, there is little doubt, we shall be compelled to make considerable additions to it.

INSTITUTE OF BRITISH ARCHITECTS.—The Council of this Society has awarded the "Queen's Gold Medal" for the present year to Mr. Tite, M.P., the architect of the Royal Exchange.

FRIEND OF THE CLERGY CORPORATION.—Among the numerous benevolent institutions which, at this season of the year particularly, are brought before the notice of the public through the annual festivals, there is not one more worthy of whatever aid we can render it than the "Friend of the Clergy Corporation." At the present time especially, it demands the increased exertion of every one interested in its existence and progress, owing to the serious defalcations of its late secretary, Mr. Aldrich, amounting to 4500*l*., and the loss of 500*l*. by the failure of

Messrs. Strahan, Paul, & Co., the bankers. Such heavy losses to the funds of a young society must have jeopardised its existence, had not its friends, as we were pleased to hear Lord Feverham say, at the sixth anniversary dinner, on the 16th of April, rallied round the committee, and, by their liberality, partially extricated it from the difficulties in which it had been placed. The object of this corporation is to allow "permanent pensions, not exceeding 40*l*. per annum," to the widows and orphan unmarried daughters of clergymen of the Established Church, and to afford temporary assistance to necessitous clergymen and their families. It would be perfectly useless to expatiate on the merits of such an institution as this; nor need we stay to remark how many and urgent are the claimants on its resources.

A NEW CRYSTAL PALACE, on a small scale, is now in course of erection near Brompton Church. It is intended partly for the articles presented to the Royal Commission by various exhibitors of 1851; partly for the Museum of Animal Produce formed at the Society of Arts, in conjunction with the Royal Commission; for the Patent Museum; and for the important collection illustrative of Industrial Art in Marlborough House; and here these various collections are to remain until a more commodious and permanent gallery is provided for them. It will thus be seen that the government is preparing in earnest to make Kensington Gore the home of our Art-museums. Already 80 acres of ground have been purchased, and still further acquisitions are contemplated. The present building is being constructed by Sir William Cubitt entirely of iron and glass; it is about 40 feet in height, 266 feet in length, and 126 feet in breadth; the roof is circular, and the arrangement of the interior is much like the world-renowned building which graced Hyde Park in 1851. It will speedily be completed.

AN ORIGINAL PORTRAIT OF SIR WALTER SCOTT, painted by no less an artist than DANIEL MACLISE, R.A., will, we understand, be sold by Messrs. Christie during the month of May. It was, we believe, painted by MacLise somewhere about the year 1825 or 1826, at Cork, during the visit of the great author to the south of Ireland. It is said to be—and we do not doubt it is—an admirable and striking likeness of the man. From the same collection there will be also sold a fine Romney, a portrait of the beautiful Mrs. Crouch: she is represented sitting on the coast at Brighton, the head being highly finished and very lovely. Also there will be disposed of, at the same time, the original of the well-known engraving of Miss M. A. Tree (Mrs. Bradshaw), the sister of Mrs. Charles Kean.

THE BRITISH MUSEUM.—The *Literary Gazette* says there is a rumour abroad that an Art-Director is to be appointed at the British Museum, in the person of Mr. Owen Jones.

BRITISH ARCHITECTS.—Whatever unfavourable opinion foreigners, and, indeed, too many of our own countrymen, may entertain of the British Schools of Painting and Sculpture, it is quite clear that our architects must not be included among the incapables. The architects of all countries were recently invited to compete for the rebuilding of the Cathedral at Lille: forty-one designs, from England, France, Germany, Switzerland, &c., were sent in answer to the appeal, and of this number twenty-two were put aside by the jury, either for want of merit, or excess of cost over the estimate. Of the remainder, the first prize has been awarded to Messrs. Clutton & Burges, of Westminster; the second to Mr. Street, of Oxford; and the third to M. Lassus, of Paris. Of the ten prizes awarded by the jury, five were carried away by Englishmen; silver medals having been given to Messrs. J. Olden & Son, Manchester; Mr. C. Brodbeck, Leeds; and Messrs. Evans & Poplarel, London: "honourable mention" is also made of the designs of Mr. J. L. Pealey, Birmingham, and Mr. J. Robinson, London. Nor must we forget that a few years since, Messrs. G. Scott & Moffatt received, under similar circumstances, the first prize for their designs for a new cathedral at Hamburg, now, we believe, completed, under the direction of Mr. Scott, who was recently elected Associate of the Royal Academy.

"THE LIVERPOOL WELLINGTON TESTIMONIAL.—At a meeting of subscribers, Mr. Moss stated that the amount subscribed was 5893*l*. 16*s*. 6*d*., all of which, except 161*l*. 1*s*., had been collected. The interest amounted to 551*l*. 2*s*. 8*d*., and the balance is 6275*l*. 10*s*. A column, as first intended, would cost 10,000*l*. or 12,000*l*.; and the question was, what was to be done.—Mr. Charles Turner thought a column could be erected for 7000*l*.; and if the money was left at interest for a time a sufficient sum would be realised. He made a motion to that effect.—Mr. Wm. Rathbone and Mr. James Aikin preferred an equestrian statue, and Mr. Aikin made a motion to that effect.—Mr. George Arkle observed that there was no site in Liverpool for a column.—Mr. Torr objected to an equestrian statue, as there was no English artist could model a horse. Ultimately, Mr. Aikin withdrew his motion, and that of Mr. Turner was adopted." We extract the above from a Liverpool paper; and entreat Mr. Torr and the other members of the Committee, to see the equestrian statue of Lord Hardinge, by Mr. Foley: the result will be a change of opinion as to whether an English artist can, or cannot, "model a horse." We earnestly hope a column will not be adopted: but that the Committee will take steps to expend the large sum at their disposal, for the advantage of Art and the honour of their city.

MR. LEWIS GRUNER is about to leave this country for his own, having been appointed Keeper of the Royal and National Collections at Berlin. Mr. Gruner is here favourably known as an engraver and a decorative artist; in the latter capacity his services have been frequently called into requisition by the highest personages in the realm, who, we believe, have also often taken counsel with him on Art-matters generally, of which his knowledge, experience, and taste render him a safe adviser. He has been for some time at work on engravings from the Cartoons of Raffaele; how these will be completed when he is removed from them we know not. His absence will certainly be a loss to this country, and we are selfish enough to regret the preferment which deprives England of his services.

THE ROYAL NAVAL FEMALE SCHOOL.—We see, by reference to our advertising columns, that a Bazaar will be held during the current month to aid the funds of this excellent Institution, whose object it is to provide the daughters of "necessitous Naval and Marine officers, of and above ward-room rank, at the lowest reduction of cost practicable, a good, virtuous, and religious education, in conformity with the principles and doctrines of the Church of England." The cost, to the parents and guardians, of one pupil of the school, is about 12*l*. per annum; but it is clear that this sum would go but a small way towards the end proposed, and that the Institution must therefore appeal to the support of the public for a large portion of its income. We believe it is only necessary for us to direct attention to the proposed Bazaar, to obtain for it such contributions as will be of essential service to its promoters.

THE SIBTHORP COLLECTION.—A sale of nine days has dispersed a large miscellaneous collection of objects of all ages, kinds, and qualities, formed by the late Colonel Sibthorp. A more heterogeneous gathering has seldom passed under the hammer, and, considering the quantity, the quality was far below the average. The sale, however, attracted considerable attention, and realised good prices. An ivory tankard, that cost the Colonel 50*l*., realised 250*l*.; but, as some few good things went cheap, while others of inferior merit fetched three times their value, caprice rather than judgment seems to have influenced buyers. As at the Bernal sale, some most absurd prices have been given, which would never have been offered in the ordinary way of business.

ASSYRIAN SCULPTURES.—Another shipload of antiquities from the East has arrived in London, and been deposited in the British Museum; they consist chiefly of architectural and other sculptured ornaments, and of animals, some of which are reported to be admirably represented. These works are of a somewhat later date than those we have hitherto received from Assyria, and many are, we regret to hear, much injured.

REVIEWS.

CRANIA BRITANNICA: DELINEATIONS AND DESCRIPTIONS OF THE SKULLS OF THE EARLY INHABITANTS OF THE BRITISH ISLANDS, TOGETHER WITH NOTICES OF THEIR OTHER REMAINS. By J. B. DAVIS, M.R.C.S., F.S.A., &c., and JOHN THURNHAM, M.D., F.S.A., &c. Decade I. Printed for J. B. DAVIS by TAYLOR & FRANCIS, Red Lion Court, London.

Although a work of such a nature as this scarcely comes within the limits of subjects to which our notices are usually confined, it is yet one that can hardly be considered out of place. The cranial peculiarities of any of the great races of men are worthy the study of every intelligent mind, for, "as the guardian of that ray divine, which is essentially 'the image' of his Creator, the receptacle of the grand yet delicate centre of his nervous system, the skull has for some time been recognised as the best epitome of Man." From the examination of these relics of the dead may be derived knowledge of the utmost interest to the inquirer after the principles of physiology, so that those who have made them their study do not hesitate to determine the character of the living man from the osseous formation which the spade of the excavator has once again brought to the light after centuries, perhaps, of interment. The motives for the publication of this work will be found in the following remarks by Mr. Davis:—"As these islands have become the dwelling-place of a people, which in future ages of the world will inevitably excite many curious inquiries, their origin and extraction, and ethnological histories and characters, must be regarded to be surrounded with great interest, and every valid contribution to knowledge on these matters as deserving of attention. It is in the spirit of this impression we propose to conduct our labours, remembering the importance of our subject, the obscurity in which it is almost necessarily involved, and the fallibility which may attend the best efforts to give it that illumination it deserves."

Until we had gone through the pages of this work we had no conception the subject would have yielded so large an amount of matter interesting to others than those whose business it is to investigate such a branch of natural science. True, those ghastly-looking skulls, with holes

"which eyes did once inhabit,"

are pictures humiliating enough to bring down all man's loftiness of look, and his aspiring imaginations; but they are no less reminders of his divine origin, his ennobling capacity, and his intellectual and moral powers, than they are of the ultimate destiny that awaits the most exalted of human intelligences.

There are some curious antiquarian remains engraved in the book, and representations of tumuli, from which they and the skulls were taken: altogether, the "Crania Britannica," as illustrating the origin of the English people, should find a place in every well-selected library.

THE HISTORY OF FRANCE, FROM THE EARLIEST PERIOD TO THE PRESENT TIME. By THOMAS WRIGHT, M.A., F.S.A., &c., Corresponding Member of the Imperial Institute of France. Part I. Printed and Published by the London Printing and Publishing Company, St. John Street.

Had such a work as this been commenced a year or two back, the announcement of its appearance would have fallen listlessly on the ears of the public; now the intimate alliance that has been formed, and cemented by mutual daring and suffering, between the two countries of England and France, must, it will be supposed, naturally incline each to know something of the history of the other. It is not a little remarkable how ignorant even many educated Englishmen are of the history of a country only separated from our own shores by a few miles of ocean, except it be of those periods of her annals which are interwoven with our own; and of these the points most familiar to the mind—and very often they are all that are known—are the battles we have fought, and the victories we have won: we believe that five-sixths of our countrymen who talk about Cressy and Agincourt have gained their information from no other source than the dramas of Shakespeare. But this ignorance, presuming it to exist, is not altogether inexcusable; we have hitherto had no history of France in such a form as to become popular: histories of particular periods have appeared occasionally, chiefly in connection with the biographies of distinguished characters, and translations from French writers, but such works can never supply the information we

would desire to have respecting a country which for many centuries has exercised so powerful an influence on the destinies of Europe. Such a desideratum Mr. Wright's book professes to supply, and no doubt will supply, so far, at least, as the chronicle of events that have taken place in that kingdom during the eighteenth and nineteenth centuries, for it is notified that, "although the history of France previous to the year 1700 will be sufficiently detailed to satisfy all the wants of general readers, it shall be so far condensed as to give more ample room for a minute history of the many important revolutions which have succeeded each other since that period. Of the three sections, therefore, into which the history will be divided, the first will include that portion which preceded the death of Louis XIV., while the two others will be devoted to the events of the last century and a half." It is to be regretted that such an arrangement should have been determined upon: it is the earlier periods of French history of which we here are most ignorant, from the commencement of the fourteenth century, when our Edward III. went over to Guienne, to pay homage to Philip VI. for the territory of Guienne, to the end of the sixteenth century, or a little later, when the hopes of Protestant France were crushed by the murder of Henry IV.: what a catalogue of great and remarkable events affecting the future destinies of the nations of Europe does this epoch open up to the historian! we think, therefore, it is a pity the narrative should be here compressed within narrow limits, for of the subsequent periods—the long reign of Louis XIV., and the era of the great Revolution, almost a natural consequence of the state into which France had been brought by the acts of that monarch, the licentiousness of his nobles, and the neglect of the clergy—our literature furnishes ample records.

Mr. Wright, whose name has often appeared as a contributor to our columns, is well qualified by his intimate acquaintance with French history, antiquities, and language, for the task he has undertaken; all the resources which the literature of the country affords for the prosecution of his work are at his command, and his mind is of an order that leads us to anticipate in his writings the truthfulness of facts—which should be the chief aim of every historian—rather than the vivid and often false colouring, bordering on romance, in which we frequently find history presented to us. He has a wide and rich field of investigation before him, and we have little doubt his labours will have the effect of contributing to eradicate many of the prejudices existing on this side the Channel against our ancient foes, when we are made as well acquainted with the bright side of their nature as we have hitherto been with their faults and weaknesses.

HER MAJESTY THE QUEEN, HIS ROYAL HIGHNESS THE PRINCE ALBERT, HER ROYAL HIGHNESS VICTORIA, PRINCESS ROYAL. Lithographed by R. J. LANE, A.R.A., from the Portraits by WINTERHALTER. Published by J. MITCHELL, London.

Of these three portraits we greatly prefer that of the Queen, and that of the Princess Royal: they are elegant yet unpretending pictures, broad and artistic in treatment: the likenesses of both the royal ladies are excellent, and very pleasing in expression: her Majesty, we presume, is represented as she is accustomed to appear at the meeting or prorogation of Parliament, reading the speech to the assembled members. Mr. Winterhalter has been less successful in his portrait of the Prince Consort; the face lacks far too much of the intelligent expression which is so characteristic of his Royal Highness, and the attitude is stiff and constrained: but we have always noticed in the various pictures which this artist has made of his royal patrons, that he has been less happy in the male portraits than in the female. The drawings from which these lithographs are copied, were made, in 1855, by the Queen's command.

LITHOZEOGRAPHIA. By JOSEPH ARESTI. Published by the Author, 61, Greek Street, Soho Square.

The word Lithozoeographia is explained on the title-page of the book by "Aqua-tinta stippled Gradations produced upon Drawings washed or painted on Stone:" the object of the brief treatise is to afford directions for the execution of such drawings with "ease and celerity." All who are practically acquainted with the art of drawing on stone, are fully—we may add painfully—aware how much time is expended in producing with the chalk highly-finished flat tones or tints, as in skies and in buildings. Attempts have been made, at various

times, by different artists and lithographers, to overcome this difficulty by using a solution of the chalk with the brush; to this method was given the name of "litho-tinting;" it was adopted by Mr. J. D. Harding in some of the drawings made for the "Baronial Halls and Mansions of England," as well as by Mr. F. W. Hulme in several landscapes he executed; but from some cause or another, it was found, in the printing, not always to answer its intended purpose, and, in consequence, has fallen into disuse. It is obvious that if the sketch of the artist could be reproduced by this method, it would have many advantages over the ordinary process of working with the dry chalk, even if accompanied with the use of the stump. The object of Mr. Aresti is to effect more than this; he would "enliven the sombre or photographic cast so opposite to the stippled effects of aqua-tinta on copper, to which beautiful, but difficult, Art it so closely approximates, and which, perhaps, it is eventually destined to supersede, as much by the greatest variety of tones, as the manifest rapidity and ease in producing them." The method of effecting this is explained in a few brief paragraphs, to which we must refer those who may care to make the experiment. We must confess, however, that the fine-art examples introduced into the work do not much dispose us in its favour: the mechanical and architectural examples are better: but we believe Mr. Aresti is preparing a second edition of his work, which will exhibit vast improvement in the plates.

GOLDEN A B C. Etched from the German by J. F. HOPER. Published by J. H. PARKER, Oxford and London.

A volume of scripture texts, each beginning with a letter of the alphabet in consecutive order, and containing precepts, aspirations, and exhortations, selected with much good taste. The initials are filled with minute delineations of scriptural events, and each text is enclosed in an ornamental framework. The title-page by Luke Limner is very graceful, but the smaller etched title is more quaint and characteristic. The volume is calculated for all ages in life, and its simple texts may be daily conned with advantage. Such a volume will grace a drawing-room table more than many of greater pretension; it gratifies the eye while it elevates the mind.

ELEGANT ARTS FOR LADIES. Published by WARD & LOCK, London.

Should any of our young female friends be unfortunate enough to suffer an attack of *ennui*, or find cause to complain they "have nothing to do"—either of which is no uncommon malady affecting young ladies—by all means we recommend them to look into this book, where they will assuredly find enough

"For idle hands to do."

A score of "elegant arts," many of them branching out into a diversity of ramifications, are here taught, both by letter and illustrated examples—feather-flowers, weaving or plaiting hair-ornaments, imitation carvings in ivory, shell-work, painting on velvet and glass, illuminating on vellum, gilt leather-work, bead-work, potichomanie, wax flowers and fruit, and many more "arts" beside. And it ought not to be forgotten that in becoming well acquainted with some of these subjects, the mind is at the same time acquiring a knowledge of higher matters, is gaining such an insight into certain portions of the natural sciences as must elevate it above the comparative trifles upon which it is employed, and produce in it nobler aspirations.

BECHSTEIN'S HANDBOOK OF CHAMBER AND CAGE-BIRDS. Edited by H. G. ADAMS, Esq. Published by WARD & LOCK, London.

Bechstein has so long been an authority on the treatment and management of "birds in captivity," that his work has become as much of a "household book," with those who keep birds, as Buchan's "Domestic Medicine" used to be with matrons and housewives in the days of our boyhood, when, in all well-conducted households, it ranked only second in estimation to the family Bible. But Bechstein's volume is rather an expensive one for a large class of those who own feathered pets, and therefore Mr. Adams has extracted from it all the most really useful information, adding thereto instructions derived from his own experience and from reliable sources, which, neatly printed, prettily illustrated, and tastefully bound, will be heartily welcomed by many lovers of chamber and cage birds.

THE ART-JOURNAL.

LONDON, JUNE 1, 1856.

THE ROYAL ACADEMY.

EXHIBITION THE EIGHTY-EIGHTH: 1856.

LOOKING round these walls from year to year, we observe the spirit of the old school disappear—the spirit which held that drawing was not necessary to painting—that free and facile execution was the essence of Art. The works of men of that “persuasion” are now regarded as curious instances of senile infatuation. Who will say that in painting there is not a fashion independent of nature? In any given exhibition we may show all the decrees of nature pleasantly reversed, yet in the extraordinary progress of our school there is one thing for the accomplishment of which we still wait—that is, to see the microscopic labour of some of these small works applied to what is called the “grand style,” with life-sized figures—then may we expect to count the threads in draperies painted with a touch that shall make the labours of even Maclise look coarse and sketchy. But the stipple that is becoming so universal, and as it is used in working out heads, is destructive of good colour—this is instanced in all Millais’ works—it evidences labour, but vitiates the tints of natural shade. The time is not long gone by when foreign critics declared English works to be not only faulty in drawing but altogether wanting in finish; yet many of the works lately exhibited in Paris were there noticed as marvellous instances of assiduity. We regarded not long ago the works of the German school as dry and hard in their impertinent elaboration: but there may be instanced works in this exhibition which far out-distance the most careful productions of modern German Art. Our school of landscape is superior to any other in Europe, but curiously enough there is this year no landscape by any member of the Academy, and those landscapes which have recently been exhibited by members have been much inferior to those in other exhibitions regarded as very subordinate in comparison with the Academy. We have frequently of late years remarked this—this year our assertion is forcibly illustrated—*there is no landscape, essentially so-called, by an academician.* Our landscape is taking a curious divergence towards intense green, a fact more striking now than in preceeding years; the colour has reached its ultimatum—it may be yet more abused. We look at many of these works—seriously marvelling what Sir George Beaumont

would do with his brown tree (we believe it is in Leslie’s Life of Constable that the anecdote is revived). The Academy may look round inquiringly as to whom they could honour by electing as landscape painters; they need not hesitate long, there are many by whose election they would do honour to themselves. Long did we think that the walls of the Academy were alone without ears—it is not so; there are to be no more excursions in the Octagon-room—at the door is written “Price Office,” instead of what might have been formerly the inscription—

“Per me si va nella città dolente,
Per me si va nell’eterno dolore.”

The President, Mulready, Danby, Maclise, Herbert, and Dyce exhibit nothing—with one work from each of those the exhibition would have been the best that has ever been seen in these rooms; as it is, with so many valuable contributions from non-members, and even without any landscape strength, the collection is one of very superior merit.

It is probable—nay, perhaps, it is certain—that those of our painters who may have seen the great exhibition of Art in Paris, have been benefited by their visit. They could, at least, compare French and English pictures in juxtaposition, and so learn from such comparison what qualities may be safely adopted from the French school. In the exhibited works of this year, there is a greater degree of earnestness than we have ever seen before; our sketching school, to which we have already alluded, is all but extinct; and the French, who knew our school only from prejudiced tradition, were immeasurably astonished at seeing the very opposite of that which they expected to see—that is, a degree of finish far surpassing that of their own school. Unfortunately, in their criticism of all modern Art, the maxim of the mass is—“Ce qui n’est pas Français, n’est rien;” the surpassing colour of our school was not understood; but there are intelligent men who, while they justly uphold the merits of their own school, do justice to ours, and, among other things, admit the pre-eminence of our colour: in this we have nothing to learn from the French. It occurs very opportunely that there is now a portrait of Mr. Dickens by M. Ary Scheffer (according to the Catalogue), in the Academy. We regard at all times the productions of M. Scheffer with the highest admiration; he is one of the most accomplished of living artists, and stands alone in the exaltation of his sentiment; he is a school of poetic Art;—but we cannot receive this work as an example in ought to be followed: the features want relief and roundness, and the colour of the flesh is entirely false. M. Scheffer is one of the magnates of the French school, but there are fifty portraits more natural, on these walls. It is not, therefore, colour that we have to learn from French artists, but more of serious narrative in our subject-matter, be it historical, poetic, or didactic. Any observation, how rapid and superficial soever, will show the great amount of frivolous and uninteresting subjects on which the most patient and valuable labour is exhausted. When we look round the walls of the Academy, we feel some degree of shame that the objects of our school should be so little dignified, for even caricature is not without its place there. The spirit of “Pre-Raffaellism” survives, but in a modified form; the manner of execution, so called, is so easy of attainment, that many young artists, dazzled with the notoriety which has attended the efforts of the first professors of this taste,

will be continually publishing themselves as followers of the heresy, though gradually subsiding into something more reasonable, as with those who have gone before them. There is, we think, more good masculine portraiture on the walls than we have ever seen before. The heads are admirable; all full of thought and argument, most penetrating in expression, and at once engaging the spectator in speculation on the character of the individual. We are not prejudiced: we are cosmopolites in Art, and have studied every European school, but in none can we find such examples of portraiture as we find in this exhibition.

The “opening day” was, as usual, the first Monday of May (May 5),* and, as usual, the rooms were crowded with artists, eager to know their fate. Of the hanging this year we have little to complain; but it is understood that the number of pictures “rejected” is immense. This melancholy fact is easily accounted for; naturally, artists increase: all professions are, so to speak, over-crowded; and the Arts afford peculiar temptations now-a-days; for mediocrity has its chances, and will have, so long as Art-Union societies flourish, and provincial exhibitions are eager to exhibit all works “unsold.” While applicants for space greatly augment, the space they are to occupy is diminished. It is, we think, a boon, that the “Octagon Room” is converted from an exhibition-room into an office, where a clerk sits at the receipt of custom; but the consequence is, necessarily to reduce by about fifty, the number of works placed on the walls of the Royal Academy in 1856. Surely, then, it is high time to remove a grievance which presses heavily on the profession; and this can be done only, by appropriating to the Academy the whole of the building in Trafalgar Square. The members are sufficiently rich to purchase it; or, at all events, arrangements might be made by which they could become its purchasers at a “fair valuation,” deducting the estimated worth of their vested rights,—rights which must be considered as unquestionable. The

* THE DINNER AT THE ROYAL ACADEMY was reported fully in the *Times*; the party was large; several of her Majesty’s ministers were there, and others whom, for obvious reasons, the members “delight to honour.” Mr. Dyce, it appears, is a composer of music as well as pictures: the event of the evening was some new music by him to the old words, “Non nobis.” The President spoke much and well: the only passage in his speeches, however, which calls for special comment is the following: he said, or is made to say—“the office of the professed critic is, almost necessarily, to detect imperfections.” From this doctrine we utterly dissent: it is unsound in principle and untrue in fact; and coming, as it does, from high authority, is pregnant with danger. That criticism is not only unwholesome, but thoroughly evil, which labours to discover blemishes, and takes little or no note of beauties or perfections. There is no way in which genius could be so effectually crushed, or talent rendered so entirely useless, as by a system so ungenerous and unjust. We emphatically deny that any such office necessarily or unnecessarily belongs to “the critic.” On the contrary, the duty of the critic, and surely his pleasure, is to do good; to create happiness where it may be done faithfully; and to avoid giving pain where it can be avoided honestly. The man who looks upon any work—the result of toil, the produce of anxiety, and the seed of hope—or, indeed, upon any work of any kind—merely, or principally, to “detect imperfections,” is not a man whose head and heart are to be envied. The only happy man is he who disseminates happiness: this is a solemn, an impressive,—an eternal—truth. Genius is proverbially sensitive: and genius is rarely without fault. Accused he who would depress rather than sustain it; and doubly accused he who would inflict a pang where he might heal a wound.

We have felt no common indignation at the perusal of the passage we have quoted—delivered in the presence of many artists and a few men of letters. It is adding largely to the want of sympathy we have long deplored as separating the two professions: we humbly think the duty of the President is rather to combine them for mutual aid than to divide them by mutual distrust.

money thus acquired by the country might be added to a parliamentary grant; and would considerably increase the sum, which the nation will soon be called upon to expend, in the creation of a National Gallery, either at Kensington, or on the site of Burlington House.

Among the "rejected" this year are the productions of many artists who have been regular exhibitors at the Royal Academy for a quarter of a century, and who have not yet passed their zenith; while many of the most meritorious among our younger painters have also been doomed to disappointment. No one will consider this as aught but a serious evil; it is an evil that must not be tolerated. We trust that steps will be taken by the many who have thus been placed at a disadvantage; and that any appeal they make to the Government, or to the House of Commons, will receive the earnest and cordial support of the Royal Academy.

The long existing misery to which Sculptors have been subjected, is this year greater than ever. It is impossible to enter the dark den on the ground-floor, without feeling how terribly it acts against the progress of this branch of Art,—an art which advances in spite of so many positive discouragements. The subject is one that involves so many considerations—and is of such deep importance to Art—that we have resolved to postpone for a month our comments on the Sculpture Room of the Royal Academy—merely remarking now that a large number of very valuable and highly meritorious works are therein "huddled together."

No. 6. 'The Lady Claude Hamilton,' J. R. SWINTON. A full-length portrait of the size of life, in which the lady is introduced standing, and in full dress. The taste of the present day tends to plainness of attire in portraiture, and with the best reason,—it is less liable to be vulgarised than full dress: this observation is prompted by the treatment of this portrait.

No. 7. 'A Dream of the Future,' the landscape by T. CRESWICK, R.A., W. P. FRITH, R.A. This might be an incident from some of our elder novelists or poets—Richardson, Fielding, or Crabb. Although called "a dream," there is nothing somnolent, either in substance or allusion. It is a story of a country girl leaving her native village, and about to seek employment in London which appears in the distance, St. Paul's being always the notable sign of the great city. The features are charmingly painted; we see the head in profile, as she turns to take a last look at her home. The trees are pencilled very much more carefully than Mr. Creswick has worked of late, and the foliage is more natural in tint.

No. 9. 'An Arab Sheikh and Tents in the Egyptian Deserts,' T. B. SEDDON. A small picture, in which the sheikh is seen standing, and in the background, at a little distance, appears the camp. The impersonation, we doubt not, is very characteristic, and the whole is most elaborately worked out: but there is yet something insipid in these sunny shadeless breadths of desert, which no skilful painting can qualify.

No. 10. 'Christmas Day in St. Peter's at Rome, 1854,' D. ROBERTS, R.A. We have seen very few pictures in which the vastness of the interior of St. Peter's is satisfactorily given; the subject here, however, receives ample justice,—and, compared with 'Rome,' the large picture of last year, it is more scrupulously worked out. The area is filled by a gorgeous procession, in which

Pio Nino appears enthroned, surrounded by all the state of the Catholic church, and the course of the procession is lined on each side by French troops. The near figures are accurately drawn, and the more distant ones very spiritedly sketched and indicated. There is much more colour in this work than we have seen in later productions of the painter, while less than there is would not have been consistent with truth. The passages of light, half light, and shade, are most effectively distributed; in short, it is a picture of the very highest excellence—one of the best of the catalogue of important productions at which this accomplished artist has, of late, been long and earnestly labouring.

No. 11. 'A Roman Balcony during the Carnival,' R. LEHMANN. A subject frequently painted, and, we think, not of sufficient interest for figures of the size of life. In the features there is much of the Italian character, and the heads are altogether worked out with the utmost precision. The picture claims, and deserves marked attention: it is a work of high order both in composition and execution.

No. 16. 'Mrs. Coningham,' R. BUCKNER. The features tell with a certain degree of brilliancy, but they are also somewhat hard in execution. The lady is standing; she is dressed in black, and relieved by a background treated for depth. In all the portraits by this painter the persons are represented as taller than in the life: this appearance is effected here by carrying the drapery below the extremities of the person.

No. 17. 'Love's Labour Lost,' F. R. PICKERSGILL, A. The composition is according to the second act of the play.

"Biron. Lady, I will commend you to my own heart.
Rosaline. Pray you do my commendations; I would
be glad to see it.

* * * * *
Longaville. I beseech you a word; What is she in the
white?
Boyet. A woman sometimes, an you saw her in the
light.

* * * * *
Shot, by heaven; proceed, sweet Cupid."

The theme, it will be seen, is not a continuous and perfect subject from the play, but is rather comprehensive; the incidents being culled from separate passages,—but all the *personæ* are present—the Princess, Rosaline, Maria, Katharine; the King, Longaville, Dumain, Biron, and others. It is much the most natural and least ethical composition that we ever remember to have seen exhibited under this name. It is more eloquent in the language of the human heart than any antecedent production, either imaginative or from Spenser, although here there is still a tendency to allegory which sorts but ill with an everyday expression of human passion. In looking at the picture, we are at once struck with its strong relation rather to schools than to nature. The female figures remind us at once of Titian; the male figures recall Giorgione. Titian, in the vigour of his life, painted principally from one person; we see her everywhere where Titian's works are preserved; but she is especially found as 'Flora' in the Venetian Room of the Palazzo Vecchio at Florence—a picture still as bright as when it left the easel. There is the prototype of all who follow Titian, and there is the ever-surviving idea of the picture before us. We see continually a recurrence of identity in the works of most painters; but no artist would paint a series of such identities could he divest himself of the paramount idea by which he is exclusively possessed. All the figures are well drawn and painted, and the whole is brought most fittingly together; but in the upper part of the work there is a group of Cupids, which cannot be present

with real impersonations; and the objection may be even more strongly urged against the Cupid with sun-bright wings in the immediate foreground.

No. 18. 'A Group of Fowl,' W. HUGGINS. Very well drawn and painted, but not sufficiently relieved.

No. 19. 'Bedroom of Mary, Queen of Scots, Holyrood Palace,—showing the ante-room whence Rizzio was dragged and murdered, and the secret staircase by which the conspirators entered,' S. D. SWARBRECK. Rather a long title for such a subject, but an instructive picture to those who have not been to Holyrood. The historical mark on the floor is now so indistinct that we really think the story of the commercial traveller and his scouring drops, so pleasantly told by Scott, was no joke. The "damned spot" has been recently in greater danger from an enthusiastic student of chemistry, who is most anxious to scrape away the surface, and, by chemical test, set at rest for ever the question as to its being a stain of human blood. The picture is very like the place.

No. 23. 'Ennui,' the property of the Right Hon. Lord Londesborough, A. COOPER, R.A. This is really a beautiful work as a portrait of a horse; it is the kind of subject to which this artist should exclusively adhere.

No. 24. 'Haymaking,' N. LUPTON. The subject is a section of a meadow with near trees and a glimpse of upland distance; it looks as if painted on the spot and has been very diligently worked out. The trees are painted with less decision than the lower parts, and there is an unpleasant greyness in the foliage tints.

No. 25. 'A Portrait,' T. GOODERSON. A head of a child very simply and delicately painted.

No. 33. 'Sea Weeds,' H. TIDEY. We notice this to instance the silly inapplicability of the title to a party of fish girls dancing. If we are wrong in our description, the hangers are in fault, though it is one of the works that we would not have one inch lower.

No. 34. 'Mrs. Campbell of Monzie Castle, Perthshire,' SIR J. W. GORDON, R.A. The lady is standing, attired in black, and relieved by a plain background. The treatment is entirely free from affectation,—the features are fresh and clear.

No. 35. 'Home,' J. N. PATON. Here is a domestic tale recited with the most penetrating power of moving eloquence. A corporal, apparently of the Fusilier Guards, has returned from the Crimea with the loss of his left arm; he has just entered his cottage home, his clothes rent and travel-stained, for he has been long on the march. He has just sat down and is held in the embrace of his wife who kneels at his feet, and round her he has thrown his remaining arm, while behind him is his mother who hides her face and weeps upon his shoulder in that tumultuous grief which has no utterance. Even beyond the high artistic merit of the picture is its simplicity and truth—so difficult of attainment is simplicity. The group is such as we see them in this condition of life. We can discover no attempt at refinement which would at once vitiate the entire narrative—even the washing or whitening of the hearth pronounces as favourably for the observation of the painter as for the household care of the wife—that incident is a long chapter of the history. The broken boots and trowsers bespeak a toilsome journey; it is many a day since that part of his kit was on parade—and then the helmet of the Russian guardsman on the floor is a

trophy that speaks of victory won by personal prowess as dear to him even as the medal on his breast with its three clasps—poor fellow, he deserves the best pension the board can give him. Adieu, mon caporal. You will have to be honoured in old age, and fight your battles over again with your children's children; although the wife and mother look so hopeless now: and herein is the fault of this truly admirable picture—a "gem" of its class and one that honours our British School. The artist should certainly have given a more distinct impression that he meant his hero to live: and not have made the wife and mother so utterly abandoned to despair.

No. 39. 'The Stream from Llyn Idwal, Carnarvonshire,' A. W. HUNT. Really a charming production, exemplifying in a great measure the deficiencies of what is called "Pre-Raphaelite" art; these are harmony of colour with harmony of parts, combined with the utmost finish that can be accomplished in painting. The view is selected with good taste and a feeling for composition, a circumstance which we are always glad to notice, for it is not merely anything that will make an agreeable picture. The work is worthy of all praise as the best we have yet seen in the manner of its execution.

No. 40. 'The Wear at Durham,' J. PEEL. Not at Durham, but somewhere in the meadows above the city; the picture is fresh and natural in colour. The artist maliciously introduces a piscator on the banks—we wish him success: for ourselves we could never touch a fin in the Wear—commend us to the Whitadder, Till, and Tweed.

No. 50. 'Sir Anthony de Rothschild, Bart.,' S. A. HART, R.A. A portrait of the size of life, treated in the simplest manner, with a perfectly plain background; the head is successfully painted. The portrait is intended to be placed in the Jews' hospital at Mile End.

No. 52. 'Spring Flowers,' J. H. S. MANN. A little girl with her apron full of flowers; the head is an interesting study.

No. 53. 'Dutch Pinks arriving and preparing to put to sea on the return of the tide,' E. W. COOKE, A. These are the same boats that the artist has celebrated for the last two or three years; he seems as determined to make Dutch pinks as famous as Dutch tulips, but it were desirable that he should paint some other sea-flower. The skipper of the "Van Kook" (that we see is the name of the craft) is we hope too wise a man to venture to sea in such a gale. The sea is painted with a greater liberality of touch than usual, the water is not so thready as we have seen it; and this contrast gives a degree of hardness to the boats and their rigging.

No. 54. 'The Administration of the Lord's Supper,' J. C. HORSLEY, A. The cup is held by an old man and his son who kneel together at the altar, and before them stands the officiating clergyman. The figures are well drawn and painted, and to the composition is communicated a solemnity becoming to the subject.

No. 61. 'The First Buttons,' D. H. FRISTON. A small picture very minutely executed, the subject of which is a little boy trying on his first jacket and trowsers.

No. 62. 'Charles Dickens, Esq.' A. SCHEFFER. This is scarcely such a portrait of Dickens as we should have supposed that Ary Scheffer would have painted. It is extremely unassuming, but we think too highly glazed, which toning will become deeper with age. It is not, we think, a very striking resemblance: it is something, however, to be painted by so great a master.

No. 63. 'His Grace the Duke of Rutland,' F. GRANT, R.A. The Duke is presented as a man of business, being in the midst of papers and accounts, a very much better arrangement than any introduction of state. The identity is at once pronounced, but it should have been the purpose of the painter to have reduced the angularity of his study.

No. 67. 'The Lady Edith Campbell and the Lord George Campbell, children of his Grace the Duke of Argyll,' J. SANT. The two children are grouped as at prayers and wearing their night-dresses, with an expression of feeling eloquently devotional. The treatment is very simple, the light group tells against the dark background. The picture is absolutely delicious: the children are exceedingly beautiful: they belong to Nature as much as to the Duke.

No. 68. 'Little Red Riding Hood,' R. REDGRAVE, R.A. This is a large study of sylvan scenery very conscientiously rendered from the selected subject. The near section of the picture with all its grass and weeds, and the minute drawing and painting of the stems of the trees, is a most veracious transcript from nature, but the colour generally strikes the eye as too green. We have looked for leafage of this colour, but could never find it; we have never seen it either in the lights or shades, without light warmth or dark warmth—nothing is more difficult than to paint foliage under penetrating light so as to give relief respectively to the different masses; the artist has felt that difficulty here—anything that would relieve the flatness of the upper part of the picture would be an advantage.

No. 69. 'A Welsh Interior,' E. J. COBBETT. A very careful study of a portion of a cottage, in which the light, in all its effects and gradations, is admirably described. A more successful picture of the kind is rarely met with.

No. 75. 'The Last Parting of Marie Antoinette and her Son,' E. M. WARD, R.A. Scene, the Prison of the Temple; persons present, the Queen, her son and daughter, the sister of Louis XVI., and the members of the Revolutionary Committee. The subject is derived from Beauchêne's "Life of Louis XVI.," in which it is stated that the Queen, having collected all her energies, seated herself, drew her son near to her, and placed both her hands on his little shoulders; calm, motionless, so absorbed in grief that she neither wept nor sighed. She said to him in a grave and solemn voice:—"My child, you are going to leave us; remember your duties when I am no longer near to remind you of them. Never forget the merciful God who has appointed you this trial, or your mother who loves you: be modest, patient, and good, and your Father in Heaven will bless you." It is a large picture, with more freshness, less of the yellowness of the French school than we have seen in antecedent works. The composition is divided into two agroupments, that of the Queen, her children, and sister-in-law; and on the left the revolutionary committee; the former light, the latter in shade. The character and the accessories of the picture—the poignant distress on the one side, and the coarse insolence on the other, with the peculiar personalities, declare the subject as unmistakably an incident in the history of the royal family of France after the first revolution. The group on the right is of itself a picture; the darker group on the left does not approach it in the success of its chiar-oscuro, although the description of the men is co-incident with the treatment to which the unfortunate prisoners were subjected.

We cannot too highly praise the dispositions; the composition is not thronged with useless material; every object has its voice in the story. Upon the whole, we think, it cannot fail to be pronounced the best of the pictures which the artist has executed from the history of these "unfortunates." It will establish a reputation already among the highest: and may be safely considered the most admirable work of the exhibition.

No. 76. 'Mrs. Hanbury Leigh and Children,' W. BOXALL, A. This work is not so successful as others which the artist has exhibited; the figures are deficient in roundness and substance.

No. 82. 'Miss de Rothschild,' J. SANT. A portrait of a young lady in a gauze dress; she is represented standing, and the features are seen as a three-quarter face; the head is a masterly study; and the whole picture is beautiful: but the artist has been fortunate in his model.

No. 83. 'The Brook, Chudleigh, Devon,' W. F. WITHERINGTON, R.A.

"Falling fast, from gradual slope to slope,
With wild infracted course and lessened roar
It gains a safer bed, and steals at last
Along the mazes of the quiet vale."

The stones, broken bank, near herbage, water, and all the foreground material, are very successfully rendered; and not less so is the upper foliage, with the stems and branches. It is most difficult to paint sunshine on leaves, and because there is no such occurrence here, the picture is more like the reality of nature than any other production by the same hand, in which this condition of light is seen. It is altogether the most agreeable essay in this genre that has appeared under this name.

No. 85. 'Hark!' W. H. KNIGHT. An agroupment of small figures in a cottage. The incident which points the title is the father of the family holding his watch to the ear of his youngest child, seated on its mother's knee. The group is most effective, as well in relief as in colour; the head of the father, and the wondering features of the infant, are a triumph of miniature in oil.

No. 86. 'Brook Ford, Devon,' J. M. CARRICK. The arrangement consists principally of a streamlet crossed by a wooden bridge. The water flows over a shallow with weeds and stones, and is shut in and shaded by trees; the subject has undoubtedly been painted on the spot, and every passage of the work has been wrought out with the nicest manipulation.

No. 87. 'The Persian Maid,' H. W. PICKERSGILL, R.A. This picture is painted after the lines in "Lalla Rookh"—

"The young village maid when with flowers she dresses
Her dark flowing hair for some festive day,
Will think of thy fate till, neglecting her tresses,
She mournfully turns from the mirror away."

It is one of those oriental costumed figures of which the artist has painted many, and has based a reputation on them.

No. 88. 'The Countess of Ducie,' F. GRANT, R.A. The lady is attired in black velvet, and is seated, holding a book on her knee, but looking out of the picture. The features are characterised by too much severity.

No. 92. 'Crossing the Sands to Swansea Market,' E. F. D. PRITCHARD. There is a bright daylight breadth about this work which is very agreeable in effect, but it is too high for inspection: this is to be lamented, for the artist has established a prominent reputation for pictures of the class, and this is apparently one of his best.

No. 93. 'Richard Owen, F.R.S., Hunterian Professor of Anatomy and Physiology, &c.,' H. W. PICKERSGILL, R.A. The Professor, who wears his academical gown, is presented

standing as if in the act of lecturing. It is a striking likeness of a great and good man.

No. 94. 'The Abandoned,' C. STANFIELD, R.A. This is a shipwreck story, a tale of interest profoundly pathetic, painted from a passage in "The Voyage," one of the narratives in Washington Irving's "Sketch-book." A portion of the extract runs thus—"There was no trace by which the name of the ship could be ascertained. The wreck had evidently drifted about for many months; clusters of shell-fish had fastened about it, and long sea-weeds flaunted at its sides. But where, thought I, is the crew? Their struggle has long been over; they have gone down amidst the roar of the tempest; their bones lie whitening among the caverns of the deep. Silence—oblivion—like the waves, have closed over them, and no one can tell the story of their end. What sighs have been wafted after that ship! What prayers at the deserted fire-side of home!" The pathos of the writer is fully realised by the artist; with respect to the ship itself, the sad story is continued even farther. Since the abandonment of the once brave vessel, the furiously must have sunk many times into repose; but we see it now as if in sport tossing to and fro the helpless hulk, with her broken cordage hanging over her sides, and her riven copper shown as she heels to port. To give importance to the wreck, she is lifted on to the crest of a sea, while the spectator sees her from the trough. Neither on board nor around is there any sign of life; the gallant craft survives many tempests, and is yet the plaything of the mocking waves, a history even more sad than if she had gone down with all her crew—the ship, their home, still struggles to live upon the waters, but where are they? Without them she moves no more; without her they perish. The picture more than realises the sentiment of the written description. It cannot fail to be classed among the most valuable works of one of the greatest artists of our age and country.

No. 98. 'Shade,' H. JUTSUM. A small picture, a miniature in oil, showing a shaded nook of woodland scenery, of which the foreground especially is a highly meritorious passage of art.

No. 99. 'On the River Brent,' C. SIMMS. The river winds into the picture between wooded banks, and crossed by a bridge at a little distance. The view is well selected and creditably painted.

No. 100. 'West Australian, the property of the Right Hon. Lord Londesborough,' A. COOPER, R.A. This is a portrait of a horse beautifully painted and well drawn; perhaps too much refined upon.

No. 101. 'The Greeting in the Desert—Egypt,' J. F. LEWIS. Here is illustrated the ceremony of the meeting of friends in the desert. Two men, perhaps in the condition of merchants, address each other in friendly terms, grasping each other at the same time by the hand; there are also camels and a slave introduced. The men do not wear the same costume; there is a difference in their dress which may define respectively the Arab of the city and the Arab of the desert, or some other distinction of condition or country. In the execution of this picture there is a greater degree of breadth than in the water-colour works by this painter; but everything here must be accepted as of the most unquestionable accuracy.

No. 102. 'Lady Fitz-Wigram,' Mrs. CARPENTER. The lady is seated, resting her head on her left hand; there is a natural ease and relief in the pose of the figure, which is one of the best qualities of portrait-painting.

No. 110. 'Winter,' W. F. WITHERINGTON, R.A. The season is typified by a group of two figures, circumstanced in the open and bare fields, consisting principally of a field-labourer busied in cutting down the superfluous growth of wood, and secondly of a child who has brought him his breakfast or dinner. The incident is realised in a feeling which raises it beyond any of the other figure pictures of the painter—for instance, "Autumn," No. 124, is described by two children returning from gleanings, a production by no means equal to the other.

No. 114. 'Hide and Seek,' T. WEBSTER, R.A. This is a work of great self-possession. It is not like a composition, consisting of a long catalogue of household items, very embarrassing to the inmates; there is a wholesome economy, and an earnest sobriety about the scene of these gambols, which look infinitely more real than a confusion of chattels. The *materfamilias* is sitting nursing her infant, and all the elder children have hidden themselves in various parts of the room, yet to be discovered by the boy who eagerly enters the door. But all are partially visible to the spectator—here a hand, there a head, elsewhere a pair of legs—a notable distribution of heads and limbs. Were we invited to join in the game, the place of our selection would be under that hamper. The whole is rendered with that truth and sincerity which distinguish these works; the children especially are represented not as children without youth, but as children with the buoyancy and freshness of childhood.

No. 116. 'Field-Marshal Lord Raglan,' F. GRANT, R.A. The figure is presented standing in an open landscape composition, and wearing a plain military undress. The work is not vulgarised by any extravagant allusion to actual warfare. The head is well painted, and is very like what Lord Raglan was a few years ago.

No. 122. 'Burd Helen; Helen, fearing her Lover's desertion, runs by the side of his Horse as his Foot Luge,' W. L. WINDUS. The subject is from an old Scottish ballad—

"Lord John he rode, Burd Helen ran,
A live-long summer's day,
Until they cam' to Clyde Water,
Was filled frae bank to brae."

We instance this as an example of the worst taste in the selection of subject. The lady appears as a page running by the side of her mounted lover, who was a dastard; not to say anything of the discredit attending such a course on the part of the lady. The greater the success in the treatment of such a subject, the more painful it becomes.

No. 123. 'The Lady Clementina Villiers,' F. WINTERHALTER. Simply a life-sized head, elegant in character, and pointed in life-like expression; but the shaded portions are indifferently coloured; the low tints are extremely impure; they are deficient in natural transparency.

No. 125. 'A Sister of Mercy,' Miss A. E. BLUNDEN. She is visiting the bedside of a poor woman, whose days seem numbered. The principal figure is a successful study.

No. 131. 'Many happy Returns of the Day,' W. P. FRITH, R.A. A family party is here assembled in celebration of the birthday of a little girl, who is crowned with, and embowered in, flowers. She looks very much frightened; we presume she has not yet made her speech. If this work be a portrait composition, we must say of it that it is painted as well and as brilliantly as the subject can be; but if proposed as a pictorial production, it must be observed that it is an ungrateful subject. The accomplished artist might easily have selected from a thousand better.

No. 132. 'Cologne—Vegetable Market,' G. JONES, R.A. This does not look like the Altmarkt, and if it be not the Neumarkt, near the church of S. Aposteln, we give it up; we know not the *locale*. We instance this picture as an example of what we have spoken of in the introduction—our elder school of Art. It is not unprofitable to meet with something to look back upon; we see this picture down the shadowy array of the last fifty years; it is now what it might have been fifty years ago. We cannot even in old age stand still; the years then pass more rapidly, and the greater exertion is necessary to catch "the Cynthia of the minute."

No. 137. 'In Arundel Park,' P. W. ELEN. In this view we look over the trees behind the castle, the upper turrets of which catch the eye. It is an interesting view, more attractive than park scenery generally.

No. 138. 'Mr. David Cox,' Sir J. W. GORDON, R.A. There is some significance in that name; we wish it had been catalogued without the "Mister;" but let us copy the rest of the text—"Painted by subscription, and presented to him by a number of his friends and admirers of his professional eminence and private worth; to be ultimately placed in some public building in Birmingham, his native town." An ungrateful addition that, from "ultimately,"—the father of the Water-Colour ought to have been spared that *memento mori*. What, we ask, are the people of Bettws to do?—they ought, at least, to have a statue, for David Cox's constancy to Bettws has seen two generations laid in that primitive churchyard. What is not due in these days to the man whose patriotism sternly refuses to paint anything but English scenery? We might well expect such a resolution from a head like that; farewell, "Mister" Cox: may we yet meet, for years to come, under your own weeping skies, in Pall Mall East.

No. 139. 'Napoleon III., Emperor of the French,' the picture the property of the Queen, E. BOUTIBONNE. This is a small equestrian portrait of the emperor, who wears a military uniform. The resemblance is most perfect. The figure and horse are relieved by an open and plain background.

No. 140. 'Hero and Leander,' J. COLBY. A small picture; apparently is the discovery of the body of Leander by Hero. The agroupment and circumstance point directly to the subject.

No. 144. 'Hermione,' C. R. LESLIE, R.A. She is here presented upon the pedestal, and we may suppose her contemplated by Leontes and those with him. The features are modelled to a most appropriate expression—that of tender supplication—she wears the courtly ermine and a regal robe. The head, with the exception of being somewhat too large, is sufficiently successful to suggest the wish that the figure had been made more statuesque.

Nos. 145 and 146. 'Geraniums and Roses,' by Miss MUTRIE and Miss A. F. MUTRIE, exquisitely painted: and with an accuracy that rivals nature.

No. 147. 'Saved!—Dedicated to the Humane Society,' Sir E. LANDSEER, R.A. This is a large picture, showing the rescue of a child from drowning by a large Newfoundland dog. The little boy has been playing on a jetty or breakwater and has fallen into the sea, whence he has just been dragged by the dog. He lies motionless across the fore legs of the animal, the head of which is raised and looking for further assistance. Beyond the fragment of the jetty all is open sea—the attention by the way paid to the individualisation of these stones reduces the importance of the group.

The head of the dog is of course a most masterly study, but the paws have the appearance of being too large. The picture is careless of finish: it is, indeed, a work of genius without labour. Especially it is to be noted that the dress of the child has certainly never been in the water at all.

No. 153. 'Thomas Carlyle, Esq.,' R. TAIT. The subject is presented in profile, in a pose of profound thought. The head is a careful and characteristic study.

No. 154. 'After Sunset,' T. S. COOPER. A group of cows on the bank of a river, seen as in deepening twilight. The work evinces much of the feeling of a foreign school.

No. 155. 'H. M. the Empress Eugénie,' the picture the property of the Queen, E. BOUTIBONNE. The Empress is mounted and wears a lilac silk riding-dress, and is circumstanced as if in the gardens of Versailles, it may be. The resemblance is at once recognisable, and throughout, the composition is brought forward with the most scrupulous nicety.

No. 157. 'The First Scrape,' R. FARRIER. A small picture, in which a boy is seen attempting to play the violin. His success is indicated by his sister, who holds her ears, and the howling of the dog. The figures are very studiously finished.

No. 160. 'The Letter,' E. DELFOSSE. A small work painted in the taste of the French school; it is agreeable in colour.

No. 161. 'The Old Church on the cliff, Bonchurch, Isle of Wight,' J. E. MEADOWS. This has been studied very accurately from the place; there is nothing very tempting in the subject, the merit of the picture consisting entirely in the natural reality of the representation.

No. 162. 'The Graces,' W. E. FROST, A. To this every-hymning triad the artist adds a small company of Loves, we think with injurious effect. In these figures the flesh tones seldom rise above a middle tint, but the surface texture is delicate to a degree. The movement of the figures looks constrained and measured, a circumstance likely to arise from an expression of fatigue in the model. The back of the figure, turned towards the spectator, looks near the waist as if it had been compressed by the stay. It is however a work of very high merit—elegant and refined in every idea; and sustains the reputation of an artist who deservedly stands at the head of "his order" in this particular line.

No. 166. 'Hugh Heber Percy,' C. COUZENS. Study of the head of a child, a fair-haired boy—executed evidently with infinite nicety of execution, though too high to be examined.

No. 171. 'The Brambles in the Way,' J. C. HOOK. As to careful execution and reality of representation this work is of a high character, but it is deteriorated by one default not uncommon in these times—that is, the greens are greener and colder than those of nature. With reference to the title—the allusion is to the passage of a country girl over a stile, her progress being impeded by the brambles.

No. 174. 'Part of the city of Morocco (containing the Sultan's palace and gardens), and the Atlas range of mountains as seen from the roof of the Mahmonia palace, the residence assigned to her Britannic Majesty's mission during the months of March and April, 1855,' W. H. PRINSEP. Morocco is a place we know little about, therefore in as far as such pictures are correct, they are instructive. The edifices are low and unpicturesque, we see something however of the country, which is hot enough—without vegetation sufficient to afford one meal to a grasshopper; even the snow on the peaks of the Atlas looks hot.

No. 175. 'The Emperor Charles V. at Yuste,' A. ELMORE, A. This picture is painted from Sterling's Cloister life of Charles V., and the immediate incident—that of contemplating the portrait of the Empress—is one which has been already several times studied. "The sunshine again tempted him into his open gallery. As he sat there, he sent for a portrait of the Empress, and hung for some time lost in thought over the gentle face, which with its blue eyes, auburn hair, and pensive beauty somewhat resembled the noble countenance of that other Isabella, the great queen of Castille. He next called for a picture of our Lord praying in the garden, and then for a sketch of the Last Judgment, by Titian, &c., &c." The Emperor wears a suit of black, and is seated in a black chair, a repetition which we never remember to have seen before practised with such force of effect—such force as to nearly annihilate the remaining agroupments. The Emperor is seated on the left of the composition, and near him stands Philip II., who looks older than Philip was at this time, and handsomer. The pictures are brought and placed before the Emperor by monks and servants; and on the extreme right is a group the removal of which would improve the picture, as it detracts from the concentration which should be the feeling in respect of the Emperor. The work is however a composition of great power; the subject is the best the artist has ever entertained, and he has done it ample justice.

No. 176. 'Sir John Watson Gordon, R.A., President of the R.S.A.' Painted for the Academy by JOHN GRAHAM GILBERT. The great portrait-painter is here introduced in court-dress, we had rather seen him in tweed, and on the Tweed with a salmon-rod in his hand. The head is very like that of the subject and is satisfactorily painted, but the extremities should be re-constructed.

No. 177. 'Scene in North Wales,' W. S. BACH. The lines here tell with good effect, and the quantities compose well, with the exception of the principal mountain being brought into the centre of the view, beyond this we can see nothing—the picture occupying a distinguished place near the ceiling.

No. 179. 'Shells of the Ocean,' G. E. HICKS.

"I stooped upon the pebbly strand,
To cull the toys that round me lay,
But as I took them in my hand,
I threw them one by one away."

It is a young lady who thus gathers and throws away the shells. It is apparent that the head of the figure is too small, but also that there is knowledge and judgment in the picture, but beyond this nothing is discernible.

No. 181. 'Children,' MRS. W. CARPENTER. A group of two life-sized heads—a boy and girl; the features of the former are engaging.

No. 182. 'Handy Janie,' R. REDGRAVE, R.A. This young lady is presented to the spectator in a small section of pastoral landscape; she is flanked on each side by a water-pail, and stands near the well: we cannot speak too highly of the diligent manipulation of the work.

No. 184. 'Near Moreton, Cheshire,' E. HARGITT. A small sketch of a piece of flat scenery remarkable for sweet and harmonious colour.

No. 186. 'Trukkee, February 28th, 1845,' G. JONES, R.A. A large picture showing a rock-fastness in India, the stronghold of a daring and powerful robber-force, which is here represented as being attacked by troops under Sir Charles Napier. If the sketches from which the the picture has

been painted be true, the picture is useful in so far as it describes the nature of the pass.

No. 188. 'Daniel Wilson, D.D., Lord Bishop of Calcutta,' M. CLAXTON. This portrait has been executed for the congregation of St. Paul's Cathedral. The head is remarkable; the features are thoughtful and benevolent.

No. 189. 'Sunset in the Atlantic,' H. J. JOHNSON.

" * * * Far up the wave,
The clouds that lay piled in the golden heat
Were turned into types of the ancient mountains,
In an ancient land." * * *

The subject is not shown as at sea, but the spectator is placed in shore, whence he contemplates the sky, and the red draperies which the departing sun has so richly hung over the horizon. The sea opens on the left, on the right the view is closed by a cliff. This picture merits a better place than that in which it has been hung.

No. 190. 'Lieut.-General the Earl of Lucan, Lord-Lieutenant of Mayo,' presented by his friends in the county on his return from the command of the English Cavalry in the Crimea, F. GRANT, R.A. This is not among the most successful of the artist's works.

No. 191. 'A Guarda Costa riding out a Gale, off Fuentarabia, at the mouth of the Bidassoa, Basque Provinces,' C. STANFIELD, R.A. The landscape portion of this picture is more beautiful in colour, and more satisfactory in its various description, than any of the recent works which its author in the same class of material has dealt with. But the guarda costa—there is the pith of the story—she is jumping over these avalanche-like rollers, holding on by only a painter, not even a hawser—a cunning device of the artist to move the sympathies of the bystanders towards these poor fellows whose lives are thus wantonly jeopardized; for a few yards behind her are rocks, on which they must instantly be cast. The boat and all her gear are admirably painted.

No. 193. 'On the Rosslyn-park Estate, Hampstead,' H. TIFFIN. Small but solidly painted—spotty with busy lights, inasmuch that the eye has no resting-place; it must be a very circumstantial imitation of the place.

No. 194. 'Scene in the Highlands,' R. H. ROE. A small picture, showing lake and mountain; the essence of Highland scenery; too highly coloured perhaps, but very effective and deeply interesting in subject and treatment.

No. 198. * * * R. HANNAH. A small picture, which in the catalogue is described by a couplet from a song instead of a title.

"When I showed her the ring, and implored her to marry,
She blushed like the dawning of morn."

The fair one is a cook maid who is occupied in scouring her pans at the window of her pantry, wherein is introduced the hand of a policeman holding the ring; but the painter has not worked up to the sentiment of the verse, for the lady is neither coy nor blushing. The figure, with all the household gear by which it is surrounded, is accurately drawn, and very firmly painted.

No. 200. 'Peace Concluded, 1856,' J. E. MILLAIS. One of the happiest results of peace—one which as dealing directly with our affections, not with our interest, and so coming home to our hearts and hearths—is proposed for illustration here. An officer—it is not shown whether he has returned to his home sick or wounded or on leave—reclines on a sofa, holding in his hand that number of the *Times* which announces the conclusion of peace. On the same sofa sits his wife,

with one arm thrown round his neck and the other joined in his; behind them is a very large and wide-spreading myrtle, and before them are their two children, playing with the box of toys known as Noah's Ark. The agroupment of the two principal figures, although a probable incident, is not easy. We lose first the extremities of the husband and have to look for them beyond the wife, and then the question arises as to what she is seated on—being upheld only by a supposition that she occupies some mysterious space at the edge of the sofa. The proposed sentiment upon the part of the wife is an inward tumultuous gratitude, too large and impetuous for mere words, for it has filled the citadel of her heart, and for a time overpowered the tongue to silence; the feeling may be shared by the husband, but it must be in a mixed form. The children in their play make a pointed allusion to the political phase of the time (whether they be both girls, or boy and girl, we cannot tell, so fantastically antique is their dress), one offering a dove with an olive branch to the father, and on the mother's knee the other typifies the four belligerent powers by a lion, a bear, a cock, and a turkey. These allusions could not be understood by children of such tender years—hence this passage of the composition becomes caricature—an infelicitous counterpoint to the emotions of the parents. The colouring and shading of all the faces is the same: the shade tints are brown, opaque, and unnatural; in the children these shades exist in the same strength and in the same tints as in the parents. The drawing and painting of the lady remind us at once of the drawing and painting of the mother in the 'Rescue' (we mean the fire picture); that is, beneath the draperies there is no substance, and the drawing in other respects is glaringly faulty. For instance, the shoulder has no breadth or roundness, the line of the shoulder and that of the arm coincide in an obtuse angle. Whether the arm and shoulder did or did not fall into such lines, they should not have been so drawn. The head-dress of the lady is vulgarised by a towering plait of hair, and the children are stultified by antique dresses in which they cannot move. If we further consider the drawing of the mother we find her ten heads high, and the hands of the children are coarse and heavy; that holding the dove is the rough red hand of an adult. The scene does not appear to be a balcony, or gallery, or greenhouse—it is not apparent that it is either, whence then the myrtle that flourishes at the back of the principal group? Originality is the offspring of genius, but originality must be supported by probability in the absence of patent truth. There can be no substitute in a proposition of originality; the fallacy shows at once as affectation—eccentricity—or absurdity. The myrtle here seems at least an impropriety. If this be another example of what is called pre-Raphaelite Art, we should be glad of an explanation of the term. Every one of the works of this artist differs from the other, and yet all are called pre-Raphaelite. We can understand those differences in the works of an artist which declare improvement, but we cannot understand that works differing only in their degree of declension should represent excellence worthy of imitation. The 'Ophelia' differed from antecedent works (we forget the precise order of these works, and their exact titles), the 'Huguenot' from the 'Ophelia,' the 'Soldier's Return' from the 'Huguenot,' the 'Rescue' from the 'Soldier's Return,' and 'Peace' from the 'Rescue'—and these differences are not of an ordinary kind—yet all is "pre-Raphaelite."

"Aut prodesset volunt, aut delectaret poetæ;
Aut simul et jucunda et idonea dicere vitæ"—

and such should be the desire of painters, but productions conceived and executed in such spirit are neither profitable nor pleasurable; but our hope is in Ruskin,—he will dare to praise this picture and others of which we have yet to speak.

No. 201. 'General Sir Colin Campbell, K.C.B.,' H. W. PHILLIPS. This is a portrait of some interest to those who have not seen the brigadier, who with his Highland bonnets received the Russian Cavalry in line. There is an immensity of character even in the figure, and the face is one not easily to be forgotten.

No. 207. 'The Right Hon. David Salomons, Lord Mayor of London, in the costume worn at his reception of the King of Sardinia, at Guildhall, on the 4th of December, 1855,' S. A. HART, R.A. The Lord Mayor is really a fine subject for a portrait, and the painter has certainly availed himself of the advantages presented to him; the head is a good study,—his lordship wears a scarlet mantle of State.

No. 208. 'Highland Nurses—Dedicated to Miss Nightingale,' SIR E. LANDSEER, R.A. These nurses are two does that lick the fatal wound of a poor stag that has been shot, and is dying on the highest point of one of the Highland mountains. If it be true that these animals mutually make an effort to relieve the sufferings of each other, it is a most interesting illustration of the fact, but it loses value if only a conception of the painter. The poor stag seems to be beyond appreciating the attentions of his nurses. It is unnecessary to speak of the impressive truth in the drawing and painting of the animals.

No. 209. 'A Passing Cloud,' J. C. HOOK, A. The title alludes to a quarrel between two rustic lovers, but the force of the picture is its landscape material, the whole of which, comprehending a portion of a farmhouse and yard, with adjoining pastures, trees, and hedges, seems to have been most patiently worked out from some veritable locality. The entire composition is kept down to a very low tone, for the sake of breadth. The vegetation and foliage impress us as being too green.

No. 215. 'The Assassination of Alboin, King of the Lombards,' C. LANDSEER, R.A. He was murdered at the instance of his wife, who, having removed the guards and all arms, caused the assassins to be introduced into his sleeping-chamber, where he was slain. His sword was tied to its scabbard by his faithless queen, therefore, having nothing wherewith to defend himself, he has stricken down one of his assailants with a stool, and is making a blow at another, but the spear of the assassin is already at his breast. The action of the murderer is by no means so energetic as it would naturally be in such a situation; the figures, indeed, generally are less creditable than the draperies and accessories of the composition.

No. 216. 'Dr. Sandwith, late Chief of the Medical Staff, Author of "The Siege of Kars,"' H. W. PHILLIPS. The portrait looks younger than the subject, but it is firmly painted, with features earnest and intelligent.

No. 219. 'Morning—Dunolly Castle, near Oban,' J. MOGFORD. One of the most picturesque views in that romantic region.

No. 221. 'The Breakwater at Plymouth,' F. R. LEE, R.A. This view shows the stupendous work perspective running into the picture. The time of tide is high water, with the wind off the sea, and the surf beating violently over the extremity of the

breakwater. On each side the view is open, a few figures, therefore, complete the arrangement—scarcely subject enough for a picture so large; it is, however, unmistakably like the place.

No. 224. 'Evening—a sketch in the Isle of Arran,' Mrs. G. E. HERING. A succession of mountains seen in the subdued light of evening; it is a most attractive subject painted with infinite taste and sweetness.

No. 226. 'The Friendly Covert—a Sketch,' T. H. MAQUIRE. A group of persons are here seen concealed beneath the shade of the trees of a dense forest, while their pursuers are passing below; the costume, as far as we can see it, seems that of the days of mail and surcoats. It is an effect satisfactorily managed.

No. 230. 'Master Isaac Newton in his Garden at Woolsthorpe, in the Autumn of 1665,' R. HANNAH. The point of the picture is the fall of the apple, which lies on the ground before the philosopher, who is seated in the shade of the tree. It would scarcely be possible to paint this subject so that it should not be at once recognised, but many degrees of effectiveness might be given to it. This is a dark picture, and the artist has thought it necessary to distinguish Newton by an accompaniment of books and mathematical instruments; in the treatment of such an incident this is superfluous. But what is more powerful than all else in the composition is the importunate green-sward just beyond the immediate base. This inexorable green *saut aux yeux*, before all else, superseding even the figure, and every secondary object. It is an excellent subject, but has now been too frequently painted.

No. 242. 'Sunny Moments,' F. W. HULME. A very graceful landscape, affording a view of remote Welsh mountains lighted by the sun. The distance is only a glimpse, for the nearest ground of the picture is almost closed by trees, elegant in form and masterly in execution.

No. 243. 'The Brook,' W. GRAY. A small composition, agreeable in colour and forcible in effect.

No. 245. 'Two Old Campaigners—Portraits of Marengo and Copenhagen, the favourite Chargers of the Emperor Napoleon and the Duke of Wellington,' A. COOPER, R.A. The horses were contemporaries, but they never met; it is a quaint conceit to bring them together, but they are well painted, and the picture would have been destroyed by the introduction of any ill-drawn figures.

No. 246. 'A Peep from the Wood,' C. R. STANLEY. The trees here keep their places, a result attainable only by the closest observation of nature, and in painting this class of subject often too little considered. The picture has in it much of the illusion of substantive reality.

No. 248. 'Agua Fresca—on one of the Bridle Roads of Spain,' J. PHILIP. The figures in this agroupment are rendered as picturesque as anything in extant costume can be. A muleteer has halted a moment at a roadside well, where a woman is drawing water, one of whose earthen vessels he raises to a distance from his head, and suffers the stream to flow uninterruptedly into his mouth. The muleteer is a grand figure, just such a fellow as would have interested Velasquez, and the artist has made the most of him. That *olla*, with its garlick and bacon, makes a man thirsty in a hot day. Both he and the girl look as if in their holiday gear: for the sake of a *variorum*, it had been better that one had been a trifle thready. It is a very successful picture, though the materiality of the textures

almost supersedes the importance of the heads. The artist has made a great display of the costume, and of national personality; there is a confidence in every assertion which places his authority beyond question. It is to be regretted that undue prominence is given to the bright green flask—which first catches the eye of the observer.

No. 249. 'Portrait of the late Joseph Hume, Esq.,' J. LUCAS. There is an inscription on the frame, by which we learn that this portrait has been commissioned by a large subscription of members of the legislature, in respectful acknowledgment of his lengthened and distinguished career of public usefulness. The figure is presented standing, and so striking is the likeness in person and feature, that those who see the portrait see the man.

No. 253. 'Viola with the Ring,' G. WELLS. There is little point in the subject; she is represented by a full-length figure standing contemplating the ring. The drawing and painting of the picture are unobjectionable; more of the work cannot be seen.

No. 255. 'The Lollard discovered,' R. W. CHAPMAN. It is unfortunate that the varnish has chilled on this picture; such an accident is more inconvenient in the case of a dark picture than a light one, as it veils the depths and glazes. The subject is suggested by the introduction to D'Oyley and Mant's Bible, in which it is set forth that, by a decree passed in 1408, by a convocation held at Oxford under Archbishop Arundel, the translation into English, or the reading in English, of the Holy Scriptures, was forbidden under the severest penalty. A follower of Wicliffe is here discovered reading the Bible; but, although the picture is a creditable performance, the danger of the reader is not apparent in the mere act of discovery. It seems to be powerful in effect, and decidedly touched.

No. 256. 'Mariatte,' MISS M. E. DEAR. A small study of a child; the head is nicely drawn.

No. 259. 'On the Look-out,' H. LE JEUNE. Two children, a boy and girl, seated on a gun—a 24-pounder it may be, but to the dimensions of which a critical eye from Woolwich would demur—being too long for a howitzer, too short for field or fort service. The boy has a small glass to his eye, and may therefore be said to be "on the look-out." These two figures, which look like portraits, are qualified with that sweetness which distinguishes the youthful impersonations of the author.

No. 260. 'A Nereid,' W. E. FROST, A. One of those miniatures in oil which are among the sweetest of the productions exhibited under this name—a nude figure, standing in the sea, the water reaching nearly up to the waist.

No. 261. 'A Fisherman's Wife—Gulf of Salerno,' T. UWINS, R.A. A system of beautiful and harmonious colour prevails in this small work, which seems but an experimental essay with a view to a larger work.

No. 262. 'The Village Postman,' J. M. CARRICK. The lilac, especially the leaves—then the housetop, with its garnish of house-leek, and the other portions of this village dwelling—these, and other passages of this work, are rendered with consummate truth. The postman and his pony are outdone by the finish of the houses and their accessories.

MIDDLE ROOM.

No. 270. 'Miss Forester,' G. WELLS. The lady is introduced in a standing pose, a half-length figure. The head is firmly painted, and clear in colour, and the work altogether creditable for the simplicity of the taste in which it is carried out.

No. 272. 'Welcome, bonnie Boat,' J. C. HOOK, A. The subject of the picture is the return of a fisherman to his cottage on the beach. He is received by his wife and child. The composition presents a limited view of the coast and its green cliffs. The work is executed with a view to breadth and substance, the tone, therefore, is kept low; indeed, the nearer and more distant parts coincide almost in a monotone, and the representation of substance is so earnestly sought, that atmospheric effect is superseded. We have already spoken of the overpowering greens employed by this painter; the same force of cold metallic tint recurs here on the cliffs.

No. 273. 'Home and the Homeless,' T. FAED. These two histories—that of domestic happiness, and that of abject misery—are gathered from Burns and Wordsworth. List the former—

"His wee bit ingle, blinkin bonnily,
His clean hearth-stane, his thriftie wife's smile,
The lispin infant prattlin on his knee,
Does a' his carkin weary cares beguile,
And makes him quite forget his labour and his toil."

Now hear Wordsworth—

—"but for her girl,
And for her little orphan boy, she said,
She had no wish to live; that she must die
Of sorrow."

Thus sing the poets, and thus says the painter—The cloth is spread, and the "wife" places on the table a pan of broth—we presume it to be, and the cotter is seated, playing with his youngest child on his knee. The contrast to this is a poor and wretched woman shrinking in a farther corner of the cottage, with two children, one of whom ventures to approach the table, looking wistfully at the broth. But for a close inspection of the touch and manner, the picture would not be recognised as a production of the painter of works that have already appeared under this name; it wants the depth and power of these productions. The effect would be improved by painting the woman's drapery in a lighter key. The outcasts, having been sheltered, should be recognised by some more positive charitable allusion.

No. 275. 'A Berkshire Lane,' N. BRANGWIN. The perspective of the road is unexceptionable, and the trees and hedges compose very happily; but the stems are too dark, they look as if painted without nature. A little more crispness in the foreground would have placed it firmly under our feet.

No. 277. * * * F. R. PICKERSGILL, A. The subject of this beautiful work is—Christ blessing little children—"And he took them up in his arms, put his hands upon them, and blessed them." The Saviour is seated, and holds two of the children on his knees; before him is one of the mothers with her child, teaching it to kneel to Christ; and at his side another checks the importunity of hers—another of the women is behind, but her action is not very clear. As spectators, two of the disciples appear on the left, but they both wear gaberdines of the same colour; indeed, the presence of those persons vitiates, in some degree, that which should be the prevailing sentiment of the subject: we feel them an interruption of the relation between Jesus and the children: we believe, moreover, that their absence would improve the effect; yet the qualities of the work are of the most signal kind: it is a production of a high order.

No. 279. 'Mountain Mist,' R. S. BOND. Showing a very sullen aspect both of earth and sky, but as a hazy cloudy day to a certain extent successful.

No. 284. 'Happy Days,' J. COLBY. A small study of a female figure—very agree-

able in colour, but apparently faulty in drawing.

No. 286. 'Philip IV. of Spain, knighting Velasquez,' A. J. HERBERT, jun. "When Velasquez had finished the picture called 'Las Meninas,' in which he had introduced himself painting the Infanta, the King came to see it; and in reply to Velasquez's inquiry of his approval of it, said that one thing was wanting, and taking a brush he painted on the portrait of the artist the red cross of the order of Santiago." There are accordingly two figures, the King and Velasquez, the former painting on the picture which the spectator sees in the glass behind the King, placed there by the painter to assist him in correcting his drawing. It is a striking incident, an effective subject, and judiciously managed.

No. 287. 'Nymph and Wood-pigeon,' G. PATTEN, A. A semi-nude figure—too heavy and material for the ideal of a nymph—and rendered yet more heavy by a dark drapery which severs the figure. The flesh-colour is natural.

No. 288. 'On the Coast of Sussex,' F. W. KEYL. A paradise of happy sheep, distributed over a portion of pasture-land on cliffs overhanging the sea. It is an extremely agreeable picture, produced from a very slender subject. It is harmonious in colour and piquant in effect.

No. 289. 'Climbing Church,' J. W. OAKES. A small picture worked as if from a photograph; it presents a church, graveyard; and an aged yew. It is astonishing how interesting good execution renders ordinary subject-matter.

No. 292. 'The Evening Prayer,' G. HARVOR. The eye is repelled by the blackness of the shades in this picture, which in time will become quite opaque. The point is a mother hearing her child repeat its prayers at bedtime.

No. 293. 'Portrait of a Gentleman,' J. E. MILLAIS, A. This gentleman is a little boy busy in the inspection of a book of woodcuts, but looking each spectator in the face, and complaining querulously of frequent interruption. There is more of nature here than in most of the other works of the painter.

No. 294. 'A Study in the National Gallery,' C. COMPTON. A group of wondering children looking at "The Entombment;" the objects of their interest and their whereabouts are at once understood.

No. 295. 'And the prayer of Faith shall save the Sick,' J. PHILIP. The substance and distinctive surfaces shown here resemble those of the muleteer picture. The scene is the interior of a church in Spain during public worship. A poor woman, bearing her infant with her, has brought her sick boy to the church in the faith of cure; behind her stands a tall aged man of the labouring class, and on her right two damsels, one holding a missal and the other the everlasting fan—a procession is passing by. There is no vulgar prominence given to the particular passage of the composition conferring the title; but the purpose of the mother is sufficiently perspicuous, which at once concentrates the interest on this group. It is a work of great power.

No. 299. 'A Lancashire Witch residing at Bolton-le-Sands,' J. C. HORSLEY, A. A study of a country girl going to school; very simple in treatment.

No. 300. 'An Interior,' F. D. HARDY. We have observed of other studies by this artist that the shades are black and opaque; in this there is more light and relief, but what there is of shade is extremely heavy.

No. 302. 'Winter,' MISS M. H. STANNARD. The point of the subject turns on a poor

bullfinch that has perished of cold and hunger; near the dead bird are some sprays of holly very closely imitated from nature.

No. 303. 'Ronald Stuart-Menzies, Esq., of Cudraes,' J. M. BARCLAY. A portrait of a gentleman in Highland costume; the figure is standing, circumstanced in an open background, with a mountainous distance; the *aplomb* and presence of the figure are very striking.

No. 306. 'A. H. Layard, Esq., M.P.,' W. M. TWEEDIE. The figure is seated as if in a library; the head is successfully painted, but too much is made of the background, there is a superabundance of red, and it supersedes the person in importance.

No. 309. 'Three portraits of a Lady,' F. W. MOODY. She must have had extraordinary patience to sit for these three heads: one is a full face, one three-quarters, and the third shows only the cheek; it is not a pleasing kind of portraiture.

No. 310. 'The Parable of the Children in the Market-place,' W. C. T. DOBSON. This subject occurs in St. Luke, chap. vii.—"Whereunto then shall I liken the men of this generation? and to what are they like? They are like unto children sitting in the market-place, and calling one to another and saying, 'We have piped unto you, and ye have not danced; we have mourned to you, and ye have not wept.'" In this composition is forcibly illustrated the heedlessness of mankind to the preaching of Christ. The picture presents a company of young children; the Saviour himself is represented as a child, and also St. John, who is with him. Christ is preaching to them, but they do not listen; one closes his ears, another treads under foot the lily, and plants a poppy in her bosom; two others are active in pursuit of butterflies—the action of every one betokens utter neglect of the divine precepts. All the figures are drawn and painted with accuracy, and each is endowed with an expression animated, and, in a great measure, contemptuous of the teaching of Christ. There is not in the text an authority for the introduction of the Saviour, yet without his presence the Pharisaical unbelief of the children could not have been so obviously indicated. There has been, however, no undue licence, and the picture is unquestionably among the very best of this year's exhibition.

No. 311. 'The Novice,' J. C. HORSLEY. We find her seated in the cloister of the nunnery to which she is about to attach herself by vow; she has been employed in forming garlands for some festal ceremony of the church, but instead of prosecuting her task she is amusing herself by caressing a dove; and, being observed by two of the elder sisters of the house, is perhaps subject to some penance. The incident is sufficiently legible, but the severer sisters are too prominent to be unobserved by the novice.

No. 312. 'Mid-Spring,' J. W. INCHBOLD. All the shaded herbage in this work is so abundantly mingled with blue flowers as to give to the grass a cold frosty appearance, but upon close inspection the wondrous and patient manipulation by which all this is realised excites vastly the admiration of the spectator. Each blade of grass and each minute "forget-me-not" has its place in the vegetable throng, and the trees and foliage are microscopically reproduced. The flowers certainly faded, the grass withered, and the leaves fell before this picture could have been painted.

No. 313. 'Dancing Dolls,' G. SMITH. We become here one of a company who are mightily entertained by an Italian boy with

his itinerant theatre, consisting of a deal board and a couple of dolls. Infant wonder and youthful admiration of the graceful movements of these two puppets, are very literally depicted in the features of the village throng, every member of whom is most scrupulously made out. The weakness of the picture is its colour, good effect is overlooked; the trees and distant objects, for instance, are forced upon the nearest plane of the composition. We have very highly commended the smaller works of this artist, but the infatuation of colour renders his larger productions incomparably more feeble than these.

No. 317. 'Changing Pasture,' J. STARK. Principally a screen of trees telling against the sky, and a clear distance. In the sylvan fragments usually painted by this artist there is a substantive truth which sustains itself well even in comparison with the marvellous finish of the present day. The title refers to a flock of sheep which are being driven from one field into another.

No. 319. 'Doubt,' F. SRONE, A. The group presented in this picture is costumed and circumstanced like the fishing population of some part of the French coast. They are at the door of their cottage; the most prominent members of the group being a youth and a maiden—the latter seated, the former standing by her, and showing her a pair of ear-rings, which he has purchased for her. She looks at the trinkets with a smile of levity and carelessness, by which he is pained, and doubtfully turns his head away to another sister who is tenderly helping her aged grandmother to totter out of the cottage to join the circle. The picture is larger than any we remember to have seen before, under this name. In the female figures especially there is a personal refinement which gives to these impersonations rather the appearance of enacted than real characters.

No. 320. 'The Glen, Chudleigh, Devon,' W. F. WITHERINGTON R.A. A close shady scene, with a little stream flowing out of the picture, and looking much like a section of copse in the home-grounds of some mansion. We observe again that the works of this artist are much broader and more effective than antecedent productions.

No. 321. 'The Deluge,' S. B. HALLÉ. This is a very large work, executed in the feeling of a foreign school. The narrative sets forth the agony and despair of a remnant of human beings, among the last of their race who have retired before the rising waters, till they find themselves diminished in number, and fished to death on the last summit of the rock to which they have fled for refuge. There is a king, whose sword now lies at his feet, powerless to defend and avenge, who yet grasps his crown, now a mockery of state; he endeavours to support one of his family, who dies even before he sinks in the inevitable waters. At his feet is a mother abandoned to despair, yet still clasping her child. Behind him is one widely vociferating imprecations on the Deity; and near him a woman, become a gibbering maniac from the shock of overwhelming terror, pronouncing her drivelling rebuke to the inexorable tide. From another group men and women drop from the rock—being claimed by the insatiate deluge: they float awhile, and then disappear. In this description the artist has taken high ground: he is a natural expressionist of great power, for there is a definite passion in each figure. The principal superior form of the composition is semicircular, traversing the picture diagonally from the upper left corner towards the lower right corner—and he knows what to do with his

limbs, the extremities being made to contribute to the details of the awful episode. The drawing is that of an accomplished student; the execution is simple and unmannered; and the colour is better than we generally see in the essays of foreign schools.

No. 322. 'Loch Lomond, Scotland,' J. DANBY. This is apparently a proposition of morning effect. There is much sweetness in the lighter parts of the picture, but the shaded passages are heavy and opaque.

No. 326. 'The Earl of Ellesmere,' K.G., E. LONG. A simple and unaffected portrait, presenting the subject at half-length, seated. In the features there is resemblance, but not, we think, personally.

No. 327. 'The Children in the Wood,' J. SANT. They are lying on the ground in a glade of the forest; asleep, it may be presumed, as there is colour in their cheeks. The pose is not favourable, the heads being towards the spectator. The picture is agreeable in colour, but it will not be considered one of the best of its author's works.

No. 328. 'Un Corrillo Andaluz,' D. C. GIBSON. The intense vulgarity of a foreign title comes effectively out among such others as "A Kitchen Corner," "A Group of Sheep," "A Bird's Nest," &c.: these melodious vowels and liquid consonants are music amid our hard and hissing vernacular. But the picture is really praiseworthy: it shows a group of Spanish water-carriers, waiting their turn at a fountain which adjoins a blacksmith's shop. A boy and girl with other figures at the fountain constitute the strength of the picture. The whole of the work is most conscientiously finished, and is, doubtless, circumstantial in description of character and national characteristic.

No. 329. 'Dona Pepita,' J. PHILIP. This is a study of a Spanish lady who has sat to the painter. She is seated as if at the theatre, shading her face with the inseparable fan, and looking with a piercing glance at the confused spectator.

No. 330. 'The Intruders,' Mrs. E. M. WARD. These intruders are children who have made their way into a pompously furnished drawing-room: they will certainly demolish something before they quit the room. It is an extremely difficult subject to paint, but it is treated very successfully. It is, indeed, among the most successful works in the exhibition, broadly and effectively painted, while the several details are carefully and minutely finished.

No. 332. 'A Group of Sheep,' D. A. WILLIAMSON. It is difficult to understand how they are grouped: we lose entirely the head of one of the animals; yet the work has some meritorious points.

No. 334. 'A Slight Touch of Heart-Complaint,' G. B. O'NEILL. The patient is a young lady, introduced to the physician by her grandmother (?). The nature of the heart-affection is, of course, understood fully by the physician; but, perhaps, not by the old lady. It may be suggested that if Sharp's (is it?) engraving of the portrait of John Hunter were removed to the dining-room, and the heavy glazing behind the doctor lightened into transparency, the picture would be improved. It has been most assiduously worked out in all its details.

No. 335. 'Orchids,' Miss A. F. MURRIE, and No. 342. 'Primulas,' by the same lady, are flower-pictures of infinite delicacy and brilliancy of colour.

No. 336. 'Street Scene in Cairo, near the Babel Luk,' J. F. LEWIS. A curious subject—no doubt true—every brick: we make this observation with some faith, because there does not seem to be any attempt at aggrandisement, either of space or object.

We find ourselves in a close street, in the company of men, camels, and pigeons. The men are generally seated; the movement of the camels is dreamy and listless; the pigeons are the only active people of business we meet with in this land of luxurious drowsiness, wherein every person, animal, and object, is realised by that microscopic stipple in which this artist stands unique.

No. 337. 'St. Peter's—Looking back on Rome,' D. ROBERTS, R.A. From this point St. Peter's is almost the only object we see. It seems as if Rome had vanished, and St. Peter's stood alone: it is a production of much excellence.

No. 341. 'Garden Flowers,' W. P. FRITH, R.A. A young lady appears here, busied in arranging a bouquet of fresh flowers. She is seated on a garden-seat, almost entirely in shade. The garden background is a well-painted probability, but the face is charming in softness of surface and colour.

No. 344. 'Farm Yard in Hampshire,' T. BARRAT. Everything here seems to be sacrificed to the horse that is placed as if it were the subject to which all else is subservient. A farm yard is a very unassuming subject.

No. 349. 'The Trumpeter,' — VANDENBOECK. He is mounted on a grey charger, and equipped too showily for a trumpeter—becoming rather the *cirque* than the field of battle, and this is the more striking as there is a battle raging in the front.

No. 350. 'A Weary Journey,' C. DUKES. A group of wayfarers, a mother carrying one child and leading another; an agreeably coloured picture.

No. 351. 'The Cornish Coast,' F. R. LEE, R.A. The picture proposes to afford an example of the heavy seas that roll in upon this coast; both sea and sky betoken wind.

No. 352. 'Chatterton,' H. WALLIS.

"Cut is the branch that might have grown full straight,
And burned is Apollo's laurel bough."

Such is the motto that is inscribed on the frame of this picture; the same accompanies the title in the catalogue. We find the unhappy Chatterton extended on a narrow couch under the window of his garret. We know that he destroyed himself by arsenic, after having applied as a last resource for the appointment of surgeon's mate to proceed to Africa; that his landlady, with the conviction that he was starving, offered him a dinner on the day before his death; and knowing these things, we are surprised to find him dressed as if he had returned from a late revel and was yet under the effects of wine. But the mortal pallor of the features on a closer examination declares death, the blood has been recalled to the citadel of the heart in its last extremity. He wears bright purple or lilac small-clothes, and a velvet coat is cast on the floor. The dress of Chatterton must have been plainer than this at the time of his death; even were it not so, it is not consistent with the spirit of the story that it should be otherwise. His abode is a garret: every friend of humanity will wish his dwelling-place had been more worthy of his powers; and this garret is in keeping with the story, but not the bright purple small-clothes and red velvet coat. It may be said that Chatterton was proud and kept up appearances; it might be so; but still the story had been more consistently moving, rather by a declaration of truth in poverty than by ostentation. Chatterton was buried, we believe, in the City, somewhere between Fleet Street and Holborn, and lived and perished in that neighbourhood. From the window of his garret there is a distant view of St. Paul's with an evening effect, which would place

his residence far east of St. Paul's, at least at Whitechapel, which is not true; if it be proposed as a morning effect, that places his residence as far east as St. James's, an assertion equally untrue. We make these observations with the feeling that in a subject of this kind, when the whole of the circumstances are patent, and the imagination has no play but in the improvement of facts, an artist cannot be too accurate in his statements. The picture, however, exhibits marvellous power, and may be accepted as a safe augury of the artist's fame.

No. 355. 'The First Letter from Home,' A. FARMER. The story is legible enough; a boy at school has received the little hamper of cakes and apples, and is reading the letter by which it is accompanied.

No. 356. 'Evening,' J. RICHARDSON. This might have been made an effective and agreeable picture, but the shaded portions are glazed into intense blackness; it contains one figure, that of a young lady seated at a window just after sunset.

No. 357. 'A Sheep "Lew,"' East Kent,' T. S. COOPER. What the Cantii mean by "lew," is shown here—a covered fold for sheep; if it be not the French word, it is a Kent-Saxon term we know nothing about. This artist has painted a few of those rough interiors before; we look upon them as a relief in respect of the sunny knoll and that everlasting lowing group of milky mothers.

No. 358. 'Professor Ferguson,' SIR J. W. GORDON, R.A. A head and bust, an excellent study, the best points of which the painter shows that he has felt.

No. 359. 'Cranmer at the Traitors' Gate,' F. GOODALL, A.

"On through that gate misnamed, through which
before,
Went Sidney, Russell, Raleigh, Cranmer, More."

This is a more solemn subject than any that has yet appeared under this name; and as a first essay in this class of subject-matter, it must be observed that the grave importance of the passage has been fully felt; for in the entire composition there is not the slightest incident inconsistent with this propriety of tone. The composition is admirably managed: the rude boat in which Cranmer has been conveyed to the Tower is drawn up to the stairs within the Water-gate, and we see him passing from the boat by a plank to the stairs—he looks up as uttering a pious ejaculation. Behind him is a group of boatmen and guards; the plank is held by a yeoman of the guard assisted by others, and he is received by the governor of the Tower, who reads the warrant received from the officer who commits Cranmer to his custody. As a background the Water-gate is treated with great breadth; there is in it no marking to interfere with the figures, in the principal of which there is dignity and commanding presence. A strong feeling of interest and compassion is expressed in the features of the guards and attendants; but there is a monk whose malignant scowl represents the spirit of persecution under which Cranmer and others suffered. It is a work of high merit, different in everything from the buoyant tone of antecedent works, but such a conception could be treated in no other feeling.

No. 360. 'Graziella,' R. LEHMANN. Lamartine's work of the same name has suggested this picture.—"One evening I began to read to them Paul and Virginia. Graziella insensibly approached me as if fascinated by some sudden power of attraction." It is a large picture with life-sized figures grouped on the shore of the Bay of Naples, which opens beyond the figures, so that they are relieved by sky and distance. The impersonations are happily conceived, and

executed with a tenderness and earnestness becoming the proposed sentiment; but we are forcibly struck by the formality of the composition, which is almost mathematically pyramidal—the principal group being in the centre, and the two extreme figures at equal distances on each side from the frame. Yet there is much in the work to commend; there is more of sacredness in it than in many works professing the purest tone of sacred history.

No. 365. 'Sir William C. Ross, R.A.,' MISS ROGERS. The portrait is not flattering to the eminent miniature-painter; the hangers also seem to have thought so.

No. 366. 'The Music of the Reeds—Portrait of Eloise d'Herbal, the celebrated Spanish Pianist,' J. T. PEELE. The former part of the title is unintelligible; the impersonation is that of a young girl, who is seated on the ground. The head is well wrought, and the figure comes well forward.

No. 368. 'Holy Loch, Argyllshire,' R. H. ROE. The shores of the lake traverse the picture as distance softened by atmosphere and mist. The principal subject is a boat aground on an islet shore in the middle of the view. The effect is that of evening, very attractively described. The Highland scenery of this artist has been rarely, if ever, surpassed.

No. 371. 'Henry the Third's tomb, North Aisle, Westminster Abbey,' H. WILLIAMS. In this large picture the extent of the aisle seems to be exaggerated. The representation is immediately recognisable, but the shaded portions are unduly black and opaque.

No. 372. 'Near Rome,' J. LESLIE.

"Beati i poveri, il regno dei
Celi e loro."

Such may be the text read by the monk to these assembled groups. The figures are numerous, and of the size of life—Italian peasants listening to their confessor reading from a Missal. It is not a subject for a large composition, the incident is not sufficiently important in its relations. The head of the reader is forcible in character, so much so as to reduce the others to a certain degree of insignificance, but the figures seem correct in their representation of nationality of feature and costume.

No. 373. 'The Conspirators—the Midnight Meeting,' P. F. POOLE, A. This is an incident from the history of Switzerland. "Arnold, Werner, and Walter (the last the father-in-law of Tell), of the three forest cantons, are described as having met by appointment at a solitary spot on the lake of Waldstätten, called Rutli, and there to have matured plans for liberating their country from the tyranny of Gessler." Such is the epitome given in the catalogue, though a much more pithy and appropriate accompaniment to the title might be found in Schiller's drama, "William Tell." We must confess some surprise at this work after those we have for some time past seen exhibited by this painter. We find the three patriots conferring secretly in a cave by torch-light, but the figures and all the circumstances are so loosely put in, that if the work were not so large, it would be difficult to suppose it anything beyond a trial sketch, containing in the lights the usual toning of yellow (cadmium?) which we find in all the works of this artist.

No. 374. 'The late Mrs. Crellin,' H. W. PICKERSGILL, R.A. In colour, expression, and execution, this is the best female portrait we have ever seen by the painter.

No. 375. 'The Deer Park,' H. JUSUM. A composition pointedly descriptive of a passage of park scenery; the foreground is a small tract of rough bottom, with a stream

flowing out of the picture; it is also well timbered, and at a little distance closed by trees; the trees are drawn and painted with a fine feeling for form.

No. 378. 'Wallasey Mill, Cheshire,' W. GRAY. There is a valuable quality of work in this picture, but the materials are curiously brought forward in a succession of straight lines.

No. 379. 'Solitude,' W. GRAY. The principal quantity in this composition is a pretty and effective group of trees telling against a richly-tinted evening sky; it is broad and effective.

No. 380. 'Bridge over the Rhone—at Leak Cantou, Valais,' G. C. STANFIELD. The bridge is covered in, like others in Switzerland, leading to a tract of country mountainous and picturesque, and constituting the principal feature of the picture.

No. 381. 'Primroses,' MRS. HARRISON. Not an elegant agroupment, but the flowers and leaves are accurately rendered from nature.

No. 383. 'Venice—Approach to the Grand Canal,' D. ROBERTS, R.A. This view is given from a point whence the parallel cuts just within the two columns; the composition, therefore, includes the library on one side, the Dogana on the other; and all the buildings on each side of the gorge of the canal. The buildings are painted with great sobriety of tint (raw umber, qualified here and there, is, perhaps, the only colour), and the architecture is more detailed than has been the case of late in these works, although the touching is rapid and slight—for instance, the ruling in some columns on the right goes not only through the columns, but also through the intervals.

No. 387. 'A Summer's Afternoon in the Woodlands of Kent,' J. S. RAVEN. The picture is lung high, but it is, nevertheless, apparent that there are good colour and composition. There is a flock of sheep in an upper section of the view; they should have been nearer the foreground.

No. 392. '***,' E. HUGHES. This is a group of a mother and child, circumstanced in a richly-furnished boudoir, every item of the upholstery of which is most minutely worked; the figures, also, are very careful.

No. 393. 'The Right Hon. Edward Ellice, M.P.—Painted for his constituents at Coventry,' F. GRANT, R.A. One of the best male portraits this artist has ever produced. The expression is agreeable and animated, and the general treatment simple and unaffected.

No. 396. 'A River Nymph,' W. E. FROST, A. A small, semi-nude figure, reclining on a bank, with her left arm resting on an urn. It is brought forward with a very fine touch, though, perhaps, not so highly manipulated as other similar studies by the same hand.

No. 398. 'The Scape-Goat,' W. H. HUNT. This work has been placed prominently before the public on the line, and the painter, as one of the "pre-Raffaellite" brethren, has attracted some share of public interest. It will be necessary to inquire into the merits of the work. The scene, we are told, was painted at Oosdoom, on the margin of the salt-encrusted shallows of the Dead Sea, and the mountains closing the horizon are those of Edom. The subject of the picture is simply a white goat wandering exhausted and thirsty amid the salt deposit on the shore; beyond the animal appears the Dead Sea, and on the other side the mountains, both forming parallels that traverse the picture. The animal is intended to represent the scape-goat of Scripture (Leviticus, chap. xvi.), one of the

two goats that figured in the ceremonies of the day of atonement. One was sacrificed, and the other was driven into the wilderness, with a fillet of scarlet wool bound about its horns, in the belief that if the propitiation was accepted, the scarlet would become white, according to Isaiah—"Though your sins be as scarlet, they shall be as white as snow; though they be red like crimson, they shall be as wool." The animal is an extremely forbidding specimen of the caprigenous races, and does not seem formed to save its life by a flight of a hundred yards. If narrative and perspicuity be of any value in Art, these qualities are entirely ignored here; there is nothing allusive to the ceremonies of the atonement, save the fillet of wool on the animal's horns, and this is not sufficiently important to reveal the story of the scape-goat. There is nothing to connect the picture with sacred history; there is no statement—no version of any given fact; a goat is here, and that is all: the ceremonies to which it is intended to refer, but does not, must be read in the Talmud. Had the picture been exhibited as affording a specimen of a certain kind of goat, from the hair of which the Edomites manufactured a very superb shawl fabric, there is nothing in the work to gainsay this. It might be hung in the museum of the Zoological Society as a portrait of an animal that lived happily, and died lamented: there is nothing in the work to contradict it. The artist went to the Dead Sea to paint the scene: but there is nothing there so red and blue as these mountains of Edom. The only point in the picture that has any interest at all is the deposit of salt; this is interesting, if the representation be true: for ourselves, we have often read of this, but never have seen anything like a truthful picture of it. The picture demands no more elaborate criticism than this: notwithstanding, it attracts scores of gazers. It is useless for any good purpose—meaning nothing, and therefore teaching nothing; although it exhibits large capabilities idly or perniciously wasted.

No. 402. 'The Lady Dorothy Nevill,' HON. H. GRAVES. A miniature in oil, of singularly minute finish. The lady is seated taking tea in a richly-furnished boudoir, being costumed according to the taste of the middle of the last century. The figure is well painted, and it would add to its reality to tone down the background, and bring the figure more forward.

No. 403. 'Bacchanalians,' W. E. FROST, A. They are dancing under the shade of the vine: it is small—a charming sketch that might be executed with the best effect as a large picture; but it would be necessary slightly to alter the arrangement, the figures being too distinctly grouped in couples.

No. 406. 'The Chapel of the Strozzi Family in the Church of Santa Maria Novella, Florence,' W. D. WEST. It is the ninth or tenth of the many chapels in this famous church that contains the Strozzi mausoleum, on which are angels in white marble—and here we are amid great and sacred names. On the floor of this church we are surrounded by the immortal works and the mortal remains of some of the most famous men that have ever practised Art. But in this picture little is seen of the chapel—everything has been sacrificed in order to bring out the painted glass.

No. 411. 'Miss Spearman,' L. W. DESANGES. A portrait of a young lady in white; the features are coloured with much natural freshness.

No. 412. 'Alexander Abercrombie, Esq.,' D. MACNEE. This is a work of first-rate

merit: the head and features are most successful in the manner in which they are lighted.

No. 413. 'The Wounded Cavalier,' — BURTON. To this number in the catalogue there is neither title nor name of the painter, the artist's letter having been mislaid during the printing of the catalogue. The story as proposed is of a duel having taken place between two gentlemen of the time of Charles I., and one is left on the ground desperately wounded. In striking a blow at his adversary he has cut deep into a tree, when his sword was broken, and it is yet sticking there. This blow has been struck from the right of the tree, but we find him lying on the left. He is discovered by two persons—a puritan and his wife or sister (either will do for the story)—the former of whom stands indifferently looking on, caring nothing whether the unfortunate man lives or dies; but the woman supports him, and endeavours to staunch the blood from his hurt. There is perhaps some difficulty about the interpretation of these circumstances, because the cavalier lies on the side of the tree opposite to that from which he struck the blow, as indicated by the sword point being towards him. The scene is the skirt of dense and dark wood, the trees of which, with a boundary wall, and the foreground herbage and stones, are all realised with singular care. We may regret that the story is somewhat unintelligible: that the artist has introduced a cobweb and a butterfly upon the broken blade—where the one was not likely to have been, and the other could not have been. But the picture is a production of great power and originality. The painter has been hitherto unknown, but this picture at once establishes his reputation; he is secure of fame hereafter.

No. 416. 'A Mountain Stream,' H. B. WILLIS. The character of the landscape is like Welch scenery, and the stream, which flows transversely through the composition, resembles the Conway. The material is very effectively distributed—trees, water, meadow, and mountain—and the feeling of the execution is such as to keep the objects in their respective places. It is a production of refined taste.

No. 421. 'A Favourite Retreat, North Wales,' F. W. HULME. A captivating subject, the beauties of which are fully felt. A stream flows down to the base of the picture, and its course is lost in the shade of a screen of trees that traverses the composition, beyond which rises a distant mountain. The foliage and herbage are expressed with infinite truth, and the colour is green—the green of nature, without any approach to that intense metallic verdure which has of late been adopted by the younger school of landscape Art.

No. 423. 'Winter,' W. HEMSLEY. A small picture containing three figures—children travelling over the snow, charged with a pail, which they have placed temporarily on the ground, to rest and blow their freezing fingers. The figures are drawn with the observance of truth usual in the works of the painter, and we feel sensibly his expression of cold.

No. 424. 'Samuel Warren, Esq., Q.C., D.C.L., M.P. for Midhurst,' SIR J. WATSON GORDON. We are always glad to meet with portraiture in which all allusion to any celebrity the subjects may enjoy is entirely eschewed. The head has all the argumentative force with which the painter usually qualifies his works.

No. 426. 'The Hon. Lady Abercromby,' L. W. DESANGES. The lady is standing enveloped in a showy shawl. The head looks

small, and the expression is not, perhaps, sufficiently dignified.

No. 427. 'Study of Trees, near Highgate,' A. COLLINS. In the manner of these trees there is much natural truth.

No. 429. 'View in North Wales,' G. SHALDERS. A section of mountain scenery highly attractive as a subject for even a larger work.

No. 433. 'The Port of Delzijl, on the Dollart, an inland sea of Holland,' E. W. COOKE, A. In one or two of the recent works of this painter, his seas are not so well painted as they were wont. The waves here are hard, and their crests sharp and cutting. They are thin, and want volume and fluidity. A dogger is sailing into the harbour with a full and flowing mainsail, and another is sailing out, and in a very short time there must be collision; for there is no sign of the near vessel easing off. There can be no truth in the position of those two boats, if we see them aright. The Dutch are better seamen than to sail into harbour without reducing their canvas, and to place their vessels in serious danger.

No. 434. 'Blossoms in May,' M. ROBINSON. This picture will strike the spectator as being singularly like the work of Maclise. There are two figures, girls, grouped together in sisterly affection. The effect is injured by the prominence of a branch of May-blossom near their heads. The drawing is unexceptionable, and although there is a degree of hardness in the outlines, the work is one of good promise.

No. 435. 'A Mill Stream, near Chudleigh, Devonshire,' N. O. LUTON. A profitable study of weeds and herbage, with an effective group of trees; the whole constituting an attractive picture.

No. 438. 'A Labour of Love,' J. W. HAYNES. The prominence given to these two figures attracts our notice. They are those of an old man and a boy; the former busy in making a boat for the latter. The execution wants softness, but the group comes well forward.

No. 439. 'Clearing Up—Evening Effect,' T. S. COOPER, A. This is a repetition of what we have seen so often exhibited under this name: a group of cattle in a Cuyper-like landscape.

No. 440. 'Lady Gooch,' J. LUCAS. There is an individuality in this impersonation which must be that of the subject.

No. 442. 'Portrait,' W. GUSH. That of a lady, presented at three-quarter length. The head is a very successful study, and is endowed with much feminine sweetness of expression.

No. 448. 'Autumn Leaves,' J. E. MILLAIS. This composition will, perhaps, be interpreted by the admirers of "pre-Raphaelite" Art as an essential sign of the divine afflatus. It contains three figures,—girls with a heap of leaves before them, to which they have just set fire, as indicated by the ascending smoke. Is it that here the painting will be as nothing—that these withered leaves shall be read as a natural consummation, a type of death—that the human forms in their youth shall signify life, or will it be discovered that the twilight of the day shall describe the twilight of the year? The three figures represent, perhaps, priestesses of the seasons offering up on the great altar of the earth a burnt sacrifice in propitiation of winter. In what vein of mystic poetry will the picture be read? The artist awaits the assignment of the usual lofty attributes. The work is got up for the new transcendentalism, its essences are intensity and simplicity, and those who yield not to the penetration are insensible to fine Art. Simply, there is a small society of young

ladies busied in gathering and burning withered leaves, a heap of which is piled up before them. There is no colour in the picture, it is painted entirely for sentiment. Two of the figures are dressed precisely alike, and all in a taste remarkably plain. The hair of each hangs most unbecomingly about their ears and faces, and their features are devoid of all beauty, and coloured into very bad complexion. Such is the picture as we see it. The leaves are very minutely drawn. We had almost forgotten a significant vulgarism; it is, that the principal figure looks out of the picture at the spectator. The look of the lady in "Peace" is also fixed on the spectator. We are curious to learn the mystic interpretation that will be put upon this composition.

No. 449. 'The Letter,' J. W. H. MANN. A small picture in which appears a young lady reading an epistle. The head and hands of this figure are beautiful in colour and most judicious in manner and execution.

No. 453. 'Servoz, near Chamounix,—Collecting Pine Timber,' H. MOORE. The locality presented here is strikingly foreign, all the material—houses, water, trees—are true and effective, and the mountains are true and harmonious in colour.

No. 454. 'Gleaners Leaving the Stubble-field,' T. UWINS, R.A. A large picture, rich with the glow of autumn; and containing numerous figures bearing on their heads the fruits of their day's labour.

No. 456. 'Æneas Macbean, Esq.,' C. SMITH. This is a portrait of extraordinary excellence; it represents the gentleman seated, and everything is subdued but the head, which is lighted so judiciously as to bring it out full and round. It were only to be desired that the background had been the merest trifle lighter round the head.

No. 460. 'W. Newenham, Esq.,' J. ANDREWS. A work of much merit, forcible and characteristic.

No. 461. 'Mrs. Willott,' W. S. HERRICK. This is one of the most elegant feminine portraits we have for some time seen. The lady wears a white robe very effectively disposed, and the figure is all simplicity and grace. We cannot too highly commend this work.

No. 463. 'W. C. Marshall, Esq., R. A.,' E. B. MORRIS. A small portrait, painted with firmness and good effect.

WEST ROOM.

No. 468. 'The Marchioness of Blandford,' J. G. MIDDLETON. The painter has succeeded in communicating to this figure—which is presented standing—a marked air of distinction.

No. 469. 'Ball at the Camp, Boulogne,' J. H. THOMAS. Nothing can be more felicitous than the description of French character here open to perusal. We are introduced into a tent, and although somewhat spacious, it is yet full of the votaries of Terpsichore; quadrilles are the order of the evening, and—

"Order and sobriety are *dos-à-dos*."

The limbs, encased in the military *garance* have it all their own way here. There are gens-d'arms, douaniers, and police, but Mars in the ascendant. There is a difference between a *pirouette* and a *vol-au-vent*. The *pirouette* of one of these foregoing figures is most perfect, and the *pas-de-zephyr* of others as graceful as the spread eagle. The ladies are of the fairest Boulognaises, grisettes, and the beauty of the along-shore population. The picture is extremely well lighted, and the throng mixes most sociably together, but the force of the

version is its movement—its perfect nationality."

No. 470. 'Grandmama Caught,' A. S. STANLEY. An old lady is here seen sleeping in her chair, and she is discovered by her grandchild. The head comes out well.

No. 471. 'The Birthday Beau,' a Portrait, F. W. KEYL. A singular conceit as a portrait. It is that of a little boy wearing a cocked-hat, and the costume of the middle of the last century. He is mounted on a grey pony, which is drawn with knowledge of the anatomy of the horse.

No. 473. 'Uncle Tom, a Study from the Life,' T. UWINS, R.A. A portrait of a negro, very characteristic.

No. 474. 'Dromedary and Arabs at the City of the Dead, Cairo, with the Tomb of the Sultan El Barkook, in the background,' T. B. SEDDON. With respect to effect, this is one of the best of these desert pictures which are now becoming so numerous.

No. 475. 'The Lake of Lucerne, from the mouth of the Brunnen, Switzerland,' T. DANBY. A warm, sunny picture, showing principally the expanse of the lake with a group of boats, the whole shut in by surrounding mountains. For a work so large there is perhaps not subject enough.

No. 482. 'A Weedy Pool,' S. R. PERCY. This is placed high, and being painted in a breadth of shade, the different parts are not sufficiently distinguishable.

No. 483. 'His Excellency Mazhar Pasha (Sir Stephen Lakeman), Governor of Bucharest,' S. HODGES. The Pacha wears a plain undress English military uniform—the features are strikingly intelligent, and full of energetic expression.

No. 485. 'On the Upper Part of the Teign, near Chagford, Devon,' T. J. SOPER. The subject is well chosen, as consisting of but few and simple parts—a bridge, a large group of trees, and a near mass with herbage; the picture is hung high, inasmuch that the details cannot be seen, but it is in composition and effect the best we have ever seen by the painter.

No. 486. 'The Bride,' A. SOLOMON. Besides herself there are two other persons present, her mother and her maid. It is the bridal morning, and she is just finishing dressing; but of the heads of the two standing figures we prefer that of the maid. It is a large composition, rich in showy draperies—the subject declares itself at once.

No. 487. 'Hampstead Heath,' G. C. STANFIELD. Nothing better than this in the way of subject-matter can be found at any distance from London. We do not know the precise point from which the view is taken, but it comes together in excellent relief. The manner of the painter seems to increase in crispness of touch.

No. 489. 'San Giorgio Maggiore, Venice, View looking East, effect immediately after Sunset,' E. W. COOKE, A. We need not describe this church, everybody knows it as well as St. Paul's; but it becomes more and more apparent that buildings are the least successful portions of the works of this painter.

No. 499. 'Mrs. Pender of Bredbury Hall,' P. WESTCOTT. There are many valuable points in this work, but the person is too much elongated.

No. 501. 'Isola di San Giulio—Lago d'Orta,' G. E. HERING. One of those Italian lake subjects which this artist paints with so much success. The buildings that cover the little island are in the nearest site, and contrast forcibly with the surrounding distant mountains, which are represented with much sweetness.

No. 503. 'Summer Crops,' W. LINNELL. The tone and feeling of this admirable picture partake of course of those of the

parent and master, J. LINNELL, who exhibits No. 526. 'A Harvest Sunset,' but a comparison of the two works will award the preference to the production of the junior. It is a common passage of cultivated country which may be found in any part of England—the foreground may have been broken up. It is full of descriptive parts, but broad withal and charming in colour. There is however a field, a division, by the way, in some degree inharmonious as to colour with the rest—a square green patch on the left, but whether it is a field of turnips or a nursery of young trees it is difficult to determine, notwithstanding the difference between a turnip and a tree.

No. 504. 'Lieut.-Col. Hamley, Capt. R.A. Author of the "Story of a Campaign of Sebastopol, written from the Camp,"' SIR J. W. GORDON, R.A. We are weary of the monotony of praise exacted from us by this eminent painter; no terms can do justice to the living expression of these features.

No. 506. 'Going to be Fed,' R. ANSELL and J. PHILLIP. The materials of this composition are common-place; but the life of the figure and the eagerness of the dogs are full of natural truth. The scene is a section of Highland landscape, and the figure is that of a buxom Highland maiden, attended by three setters in expectation of their dinner. The point of the subject is instantly apparent.

No. 508. 'The Triumph of Music,' F. LEIGHTON. This is a large picture painted by the artist who exhibited the Cimabue procession last year; but we cannot describe the difference of these two works more distinctly than by saying that the last year's work, as is well known, was full of exquisite quality, while the present picture is so entirely a failure as to be utterly deficient in the brilliant and striking excellence of the other. Pluto and Proserpine, two very repulsive figures, are seated on the left, an Orpheus—an extremely ill-conceived mythological Paganini *playing the violin*—is the prominent character; but enough: never was disappointment greater. We need scarcely say the subject is the visit of Orpheus to Hades to recover Eurydice.

No. 513. 'The Sisters,' L. W. DESANGES. These figures are portraits of the size of life. The heads are natural in colour and agreeable in expression.

No. 515. 'View on the Banks of the Thames at Maidenhead,' J. D. HARDING. This passage of river scenery has been selected with a fine feeling for composition. All that is seen of the river looks almost like a pool shut in by banks and trees; the character of the view is peculiarly English. In mellow and harmonious colour, and facile execution, the work everywhere indicates the hand and taste of a master.

No. 516. 'Andrew Marvell returning the Bribe,' H. WALLIS. Here is embodied the well-known anecdote of Andrew Marvell, on the occasion of the visit of the Lord Treasurer Danby to Marvell's humble home with a draft for one thousand pounds, in the hope of attaching Marvell to the side of the Ministry. In declining the offer of the Lord Treasurer, Marvell summoned his *chef-de-cuisine*—butler, housemaid, valet, housekeeper, his *omnia in uno*—a gruff and awkward lad, from whose replies to an inquisitorial examination by Marvell for the edification of the Treasurer, it was elicited that the provision of the two for many days was a shoulder of mutton, first roast, then cold, then hashed, then the blade-bone grilled, then cold again—*bis terque coctum*. Marvell returned the bribe with an assurance that his dinner was provided. It is a good

subject; the incorruptible member of the opposition returns the draft, and the Lord Treasurer is preparing to depart. In the drawing, painting, and lighting of these two figures there are shown knowledge and profitable study. The work is of very high merit—sufficient, indeed, to establish a reputation: although we cannot help regretting that the artist has made the patriot so "trimly dressed" as to convey an idea of wealth rather than penury.

No. 518. 'The Tiber, with the Church of St. Andrew the Apostle (and the Vatican),' W. LINTON. The cold severity of tone which has characterised the works of this artist is here relaxed in favour of a more agreeable play of colour and suavity of manner. It is a view from a particular point on the banks of the river near Rome which gives the stream dividing the composition from the horizon to the base of the picture, and showing St. Peter's at the distant extremity. It is the most agreeable of the works that have appeared of late years under this name.

No. 525. 'A. Gillow, Esq. of Wallhouse, Linlithgowshire,' S. PEARCE. The figure is erect, carrying a fowling-piece on the right shoulder; the head and features at once challenge observation.

No. 526. 'A Harvest Sunset,' J. LINNELL. We have alluded to this composition in speaking of an antecedent work. It is a view similar to those which may be obtained in some parts of the banks of the Thames below Gravesend, looking across the river at the distant opposite shore—the foreground being a harvest field, with a road going into the picture, and other auxiliaries of composition. The proposed point of the work is the sunset, the sun being a little above the horizon; but it will be felt that the force of this effect is much injured by the nearer sites of the picture being broken up; there is no repose, no rest for the eye. It is a work of great power, but not so successful as recent productions by the same hand.

No. 528. 'The Church of St. Pierre, Caen,' L. J. WOOD. A subject very often painted, but never more jealously imitated in all details than we see it here.

No. 531. 'On the Mole,' J. STARK. The idle sedgy Mole has afforded of late many landscapes: this is really one of the sweetest of the productions of this veteran tree-painter, whose enthusiasm for oaks amounts to a Druidical veneration.

No. 532. 'The Prosperous Days of Job,' C. T. DOBSON. We are grateful to the author of this production for showing us Job other than a ruined and heart-broken old man. The composition is suggested by the 19th chapter—"Oh that I were as in months past, as in the days when God preserved me; as I was in the days of my youth . . . I was a father to the poor; and the cause which I knew not I searched out." We find him here in his youth visiting the sick and administering consolation to the afflicted. The appeal of the poor is addressed to him in confidence of relief. The work is beautiful in colour; but we have one strong feeling with respect to it; which is, that the object of the artist being brilliancy of effect, all the draperies are painted up to a newness and perfection of condition which is inconsistent with poverty and distress.

No. 533. 'Doubtful Fortune,' A. SOLOMON. Rather a large composition, containing impersonations of three young ladies: one of whom augurs, by means of cards, of the destinies of the other two. The figures are graceful and natural, not characterised by that mistaken refinement which paints angels instead of women.

No. 535. 'A Gipsy Water-Carrier of

Seville,' J. PHILLIP. A life-sized study—that of a woman with her water jars, apparently about to fill them—she is as dark as a Moor, but we presume there is authority for such a complexion.

No. 541. ' * * *,' D. ROBERTS, R.A.

"And basking on each sunny promontory,
Sleeps some old temple in its silent glory."

A long, upright picture, composed from fragments of architectural remains in Greece. It is a solitude of grand and poetic character—typifying by its ruins that wondrous magnificence which is now only historical.

No. 542. 'Market Day,' G. B. O'NEILL. Rather a large picture, representing the bustle of a market day in a country town; the subject and the qualities of the execution scarcely fit it for the line.

No. 543. 'Toothache in the Middle Ages,' H. S. MARKS. A small picture containing one figure, that of a man habited in the fashion of the time of Richard II. The title and the pose of the figure savour too much of caricature.

No. 551. 'Highland Shepherd,' R. ANSELL. He is out on the hill, which is covered with snow, having been looking after the lambs, one of which, half frozen, he is carrying home, its mother following; an incident in pastoral life which is narrated with truthful simplicity.

No. 552. 'Monument to Batteone—S. S. Giovanni e Paolo, Venice,' D. ROBERTS, R.A. In this picture the water is lustrous and much more agreeably painted than in the Grand Canal picture. The buildings look perhaps more important than in the reality, but no other painter could have dealt so successfully with such a subject.

No. 553. 'L'Enfant du Regiment,' J. E. MILLAIS, A. This is the most pleasing work this painter exhibits; it is simple of interpretation, being entirely devoid of all mystic and maudlin signification. This child of the regiment is a little boy who has been wounded in the hand in some street skirmish, perhaps in Paris; his wound has been dressed, and, having been laid in the tomb of an ancient warrior, has fallen asleep covered with the coat of a grenadier.

No. 556. 'The May Queen,' an episode from Tennyson's Poem, Mrs. E. M. WARD. A very sparkling picture, in which the effect of light is extremely difficult to paint. The May Queen is dressing near the window, while her mother is preparing some part of her attire. We cannot praise too highly the breadth of light, and the manner of its introduction into the picture. It is, indeed, a very charming work.

No. 559. 'The Pet's Pet,' J. SANT. A portrait, that of the "Pet" and also of her dog, a child accompanied by her dog circumstanced in a piece of sylvan composition. Not so brilliant a performance as other examples of youthful portraiture by this painter.

No. 562. ' * * *,' H. C. SELOUS. The subject of this picture is the scene between Othello and Emilia in the bedchamber of Desdemona—

"Emil. O, who hath done this deed
Des. Nobody. I myself. Farewell: commend me to my kind lord. O! Farewell," &c.

Desdemona is seen lying on the bed, Othello stands near, and Emilia kneels by the bedside of Desdemona. The pose and expression of Othello are admirably conceived, but Emilia is, in comparison, feeble.

No. 563. 'Landscape and Cattle,' F. R. LEE, R.A., and T. S. COOPER, A. In this picture both artists excel their individual works. It is a large composition, like others that they have painted in conjunction, consisting of cattle, water, trees, and glimpses of distance.

No. 565. 'Denizens of the Tweed,' H. L. ROLFE. Two grilse and a trout rendered in the closest imitation of nature.

No. 568. 'The Measure for the Wedding Ring,' M. F. HALLIDAY. This is a so-called pre-Raffaellite work containing two figures, those of lovers seated on a garden-bench within the ruins of an ancient abbey. The lady has been working, and the gentleman reading poetry, but he is now measuring her finger for the ring. It appears to be one of the first errors of pre-Raffaellite Art to reject the beautiful in feature and expression. The lady appears to have an obliquity of vision, and the contour of her face is anything but agreeable. The dress of both figures is severely accurate, but the ruins by no means resemble such a reality.

No. 575. 'After a Day's Sport in the Highlands,' G. W. HORLOR. An animal composition, presenting a rough pony, some dogs, and dead game. Very satisfactory in execution and arrangement.

No. 576. 'Bianca,' F. S. CARY. This is proposed as the Bianca of 'The Taming of the Shrew.' She is seated with her back turned towards the spectator, a daring experiment, but the model has been most profitably studied.

No. 579. '***,' G. LANCE.

"—Fruit of all kinds, in coat
Rough or smooth rind, or bearded husk or shell."

The fruit here is not set forth in that gorgeous display which gives to these compositions the air of a regal banquet; it is a less formal arrangement, but all painted with equal freshness and beauty.

No. 580. 'The Infant School in a Country Church during Morning Service,' R. M'INNES. Many of these children, especially the heads, are inimitably painted; but the linear disposition of the heads and feet is objectionable.

No. 583. 'Chioggian Fishing Vessels, &c., running into the Lagune of Venice on the approach of a borasco or violent squall on the Adriatic,' E. W. COOKE, A. A large picture, showing principally a fishing boat making for Venice. We have observed lately that the seas of this painter have become very sketchy; this is markedly exemplified here; the waves want roundness—volume.

No. 585. 'The Birth of Edward VI. and the Death of his Mother, Jane Seymour,' E. DEVEREAUX. This is an example of the French school, remarkable for many excellent qualities, but especially for the judicious manner in which the light is managed. The principal light falls where it ought, that is on the dying queen, but it is not felt to be at all forced. We must also remark the skilful and abundant use made of draperies.

No. 586. 'The Blind Girl,' J. E. MILLAIS, A. She is seated at the roadside with her sister who leads her. The background is a field rising in gentle acclivity, but the colour is most unnatural.

No. 587. 'Byron's Early Love,' E. M. WARD, R.A. Here we observe Byron looking in at a window at Annesley Hall, where he sees Mary Chaworth dancing with her betrothed. The two lights, that of the moon outside and the blaze of candles within, are expressed with much felicity. But the head is not sufficiently an identity; the features of Byron are so well known.

No. 591. 'The Village School,' A. RANKLEY. Very unassumingly rendered, and containing nothing beyond the probability.

No. 592. 'Highland Mary,' T. FAED. This is Burns' Highland Mary, who is to be supposed as resting by the roadside on her way to visit her parents in the West Highlands. The head is an exquisite study, the

features being made out with the utmost tenderness of touch.

No. 593. 'The Browzer's Holla,' R. ANSDALL. The incident described here is perhaps common where large herds of tame deer are kept. The park keeper calls the herd up to be fed, and they answer to the call in troops. The deer, their keeper, and especially a huge mastiff, are brought forward with the usual spirit of the painter.

No. 594. 'The Viscountess Lifford,' C. SMITH. The lady stands in a garden, her right hand resting on a chair. The economy of the picture is of the simplest kind; but in the figure there is a graceful simplicity highly attractive.

No. 597. 'The Arrest of John Brown of Ashford, a Lollard, and one of the first Martyrs in the early part of Henry VIII.'s reign,' A. JOHNSTON. A passage in D'Aubigné's 'History of the Reformation' has suggested this subject. The Lollard, his wife, and their friends are surprised at table by the entrance of the constable with armed attendants, who seize Brown. His family and friends are in the utmost consternation; some prepare for resistance, but others counsel peace. The mild astonishment of the Lollard contrasted with the savage bearing of the constable is deeply impressive, and the action and expression of all present assist materially in the development of the story.

No. 600. 'The Soldier's Wife,' W. S. HERRICK. The subject of this work is found in Darwin's Eliza—

"Now stood Eliza on the wood-crown'd height,
O'er Minden's plain, spectatress of the fight," &c.

And it is interpreted by a female figure carrying an infant and holding by the hand a little boy as anxiously gazing at the combat which is raging in the plain beneath her. It is sufficiently clear that she is watching the fate of her husband. In the manner of this work there is something of the tone of a by-gone school.

No. 604. 'Leap Frog,' F. UNDERHILL. An assemblage of rustic youth at the outskirts of their village. In their gambols there is more of truth than grace.

No. 610. 'The Heir cast out of the Vineyard,' W. C. THOMAS. "But when the husbandmen saw the son they said among themselves, This is the heir, come, let us kill him, and let us seize on his inheritance. And they caught him, and cast him out of the vineyard, and slew him." We see accordingly the Saviour driven forth, followed by a crowd who scourge and insult him. The spirit of parable is sustained in an allusion to the crucifixion by the appearance of the cross in the tumultuous procession. One remarkable figure, on the right, stoops to cut a thorn wherewith to beat Christ. The mediæval costume of this figure is discordant with that simplicity which should characterise the more loosely draped attire of impersonations in religious composition.

No. 611. 'The Fern Cutter,' J. A. STAUNTON. A small study of a girl resting by the way side with a basket of fern at her back. The landscape portion of the picture is perhaps more meritorious than the figure.

No. 613. 'The Watchers,' T. EARL. These are a dog and a little girl in a cottage watching the cradle of a sleeping child. The gradations of light—the depth and repose of this very common-place subject, are worthy of all praise.

No. 614. 'William P. Barrow, naval cadet, H.M. steam frigate "Odin," the youngest son of Sir George Barrow, Bart., S. PEARCE. A small portrait, in which the young gentleman appears leaning over a rail barrier. The figure tells effectively in opposition to the clear sky and sea background.

No. 615. 'Mary Magdalene at the Sepulchre,' H. LE JEUNE. The principal figure here is that of the Saviour standing behind Mary Magdalene as she looks into the sepulchre. There is a spirituality in the work which accords with the text, but the figure of Christ is gigantic, and for such a figure the head is too small.

No. 617. 'Mrs. Landseer,' G. LANDSEER. The lady is seated, the head being presented in profile. She holds before her a Skye terrier, and a greyhound and King Charles assist the agroupment. The portrait is executed with taste and judgment.

No. 618. 'Richard and Kate,' F. D. HARDY. The subject is from Bloomfield:—

"Come, Goody, stop your humdrum wheel,
Sweep up your orts, and get your hat,
Old joys reviv'd once more I feel,
'Tis fair-day:—aye, and more than that."

It is, although a subject of the humblest pretension, rendered interesting by the exquisite painting by which the figures and all the items of the interior are realised.

In the NORTH ROOM, and hung with the architecture, are some works to which a better place might have been accorded, the more especially as we see inferior productions exhibited in better places; we have space only for the titles and names of the painters. No. 1051. 'The Kiosk,' F. WYBURD; No. 1097, 'The Madness of Glaucus,' A. F. PATTEN; No. 1100, 'Frederick Soames, Esq., Mrs. Soames and child looking out for the homeward-bound East Indiaman,' J. THOMPSON; No. 1130, 'The Mill Pool,' J. DEARLE; No. 1185, 'The Haunt of the Moor-hen,' H. J. BODDINGTON; No. 1186, 'The Sunny Hours of Childhood,' J. THOMPSON; No. 1188, 'A Morning Call,' A. B. CLAY; No. 1191, 'Sweet Summer-time,' T. F. MARSHALL; No. 1193, 'Elijah running before the chariot of Ahab, at the time of the rain after the three years' drought,' J. T. LINNELL; No. 1194, 'Frank, son of Richard Hemming, Esq., C. BAXTER; No. 1195, 'At Ghent,' A. MONTAGUE; No. 1198, 'Llyn Dinas, North Wales; early morning, A. W. WILLIAMS; No. 1201, 'Sunshine and Showers,' H. JUTSUM; No. 1204, 'On the Dart, near Buckfast Abbey, Devon,' H. MOORE; No. 1205, 'The Frozen Brook, evening,' G. A. WILLIAMS; No. 1207, 'Sunday Morning,' J. DEARLE; No. 1208, 'Guy Fawkes' Day,' T. BROOKS; No. 1209, 'The Lesson of Mercy,' W. J. GRANT; No. 1211, 'J. T. Willmore, Esq., A. E., T. J. HUGHES; No. 1214, 'Summer's Eve,' M. ANTHONY; No. 1216, 'The Woods in Summer, Sussex,' A. J. LEWIS; No. 1218, 'A Monastery Garden at Pella, in Piedmont,' G. E. HERING. We cannot quit this room without especially noticing the injustice done to the picture in three compartments, No. 1190, 'The Eve of St. Agnes,' by A. HUGHES; it is exaggerated in colour, but a production of much greater merit than a hundred others that have good positions in the three best rooms.

MINIATURES AND DRAWINGS.

The miniatures and drawings are, as usual, very numerous, but among the former, there are not this year any works of transcendent power and beauty, although many productions of very great excellence. We have already noted the gradual advance of chalk and crayon drawing; we think the taste for chalk portraiture is increasing, as we observe so many remarkable examples in this genre. Of the miniatures, SIR W. ROSS, R.A., exhibits No. 763, a head and bust miniature of the 'Princess Mary of Cambridge'; this portrait is painted for the Queen, and presents an unmistakeable resemblance of the princess; also, No. 765, 'H.R.H. the Duchess

d'Aumale, the Prince de Condé, and the Duke de Guise,' a family group, showing the Duchess holding the Duke de Guise, an infant, on her knee, and the Prince de Condé by her side; the Duke de Guise is a most successful study, but perhaps the best miniature exhibited by Sir W. Ross is No. 779, 'Mrs. Thomas Miller and Child;' the background is tranquil, and composed in a manner to assist the group and force the brilliancy of the colour; by this artist there are, also, No. 764, 'Miss Grant,' and No. 785, the 'Rev. Charles Plumer,' &c. By R. THORBURN, A., we have No. 782, 'The Viscountess Elcho,' a full-length figure in an elaborately painted Highland Landscape; it is graceful, but the eyes are certainly too large; No. 744, 'Mrs. Dunn Gardiner,' shows the lady grouped with her infant; she is seated beneath an orange tree in an Italian landscape; the feeling of this miniature will remind the spectator of one of Raffaele's Madonnas, the imitation of which, in portraiture, is an instance of singularly bad taste; No. 775, 'Portrait of a Lady,' is a full-length figure in a *moiré* antique dress, a brilliant and most agreeable performance. No. 751, 'Miss Cushman,' by T. CARRICK, is distinguished by that remarkable identity which this artist always secures in his works; No. 778, 'John Clayton, Esq.,' is perhaps the best of his masculine portraits; the features are animated and full of agreeable expression; No. 826, 'William Palford, Esq.,' is also a most successful example of masculine portraiture; No. 673, 'Major Hepburn,' by Sir W. J. NEWTON, although a portrait on paper, is one of the most satisfactory we have ever seen by its author, who exhibits also Nos. 851 and 852, 'Colonel Wilson' and 'Mrs. Wilson,' and others of great merit; No. 707, 'Portrait,' J. FISHER, that of a gentleman, is a charming work; No. 712, 'Arthur, youngest son of Charles Baring Young, Esq.,' Mrs. J. H. CARTER, is a most attractive example of youthful portraiture; No. 663, 'The late Earl of Belfast,' Miss LA MONTE, is a pleasing and effective miniature; No. 667, 'Mrs. George H. Virtue,' Miss E. WEIGALL, is brilliant in tint and most conscientiously worked out, and also Nos. 664 and 666, 'Miss Mortimer,' and 'Mrs. Talbot Baker,' Miss C. G. F. KETTLE, are distinguished by excellent quality; No. 723, 'The Right Hon. Lord Suffield,' E. MOIRA, is a full-length figure, of which the head and features are very effectively drawn and worked out; No. 747, 'Mrs. John Watson,' H. T. WELLS, is remarkable for masterly drawing and purity of colour, but the background in some degree distracts the eye; No. 761, 'Gordon, son of William J. H. Money, Esq.,' is a gem of extraordinary brilliancy, and No. 795, 'The Hon. George Bennett, and the Hon. Frederick Bennett, sons of Viscount and Lady Olivia Ossulston,' are also admirable examples of youthful portraiture; No. 793, 'Bobby,' R. CLOTHIER, is defective in drawing, but harmonious in colour; No. 784, 'Miss Grover,' Mrs. DALTON, a head and bust, very delicate in manipulation; No. 728, 'Mrs. Heber Percy, C. COUZENS, is a production of exquisite taste and masterly power; No. 820, 'Col. H. G. Wilkinson, Scotch Fusileer Guards,' H. WEIGALL, Jun., is extremely beautiful in execution and life-like in expression. There are also distinguished by varieties of valuable quality, No. 801, 'E. Court Haynes, Esq.,' E. D. SMITH; No. 796, 'The Lady Hermione Graham,' C. COUZENS; Nos. 839 and 840, 'Lady Adine Cowper,' and the 'Right Hon. Lord Auckland,' Miss WEIGALL; No. 732, 'Mrs. Dunbar,' W. EGLEY; No. 740, 'Lady Jane Levett,' H. WEIGALL, Jun.; No. 720, 'Lieut.-General Mansfield,' is a

drawing by R. CHOLMONDELEY, of much merit; No. 743, 'Miss Beamish, daughter of J. C. Beamish, Esq., Plymouth,' F. TALFOURD, is a head of a young lady extremely effective; No. 766, 'Miss Blanche Heber Percy,' R. CHOLMONDELEY, is a profile head of a child, exquisitely sweet in expression; No. 774, 'Fluffy,' daughter of W. Eastlake, Esq., Plymouth, a very characteristic and effective head of a child; No. 773, 'Dr. Neil Arnott, M.D., F.R.S.' Mrs. W. CARPENTER, a head admirably lighted for study and extremely well drawn. Of high merit are also No. 822, 'Lady Tronbridge,' J. HARRISON, and No. 823, 'The Lady Mary Yorke,' J. HAYTER; No. 918, 'Mrs. Lumley,' by J. C. MOORE, is a water-colour portrait on paper, a charming figure, simply attired in white, beautiful in colour, but the line under the cheek is too severely dark; No. 962, 'Miss C. Dumaresque,' by the same artist, is a most agreeable portrait; No. 971 is also a highly interesting production. In this room is a variety of remarkable pictures in different departments of Art, of which is it our duty to speak, even at length, had we space, but the extent to which we have felt it necessary to carry our notice of the works in the principal rooms of the exhibition, compels us to limit ourselves to a selection of the titles of some of these, and the names of the artists. No. 623, 'S. T. Partridge, Esq., M.D.,' Miss E. PARTRIDGE; No. 625, 'The Island of Philæ, above the first cataract of the Nile, from the south, afternoon,' E. LEAR; No. 629, 'Enamel of the Holy Family, painted from the original picture by Raffaele, in the Earl of Ellesmere's collection,' W. ESSEX; No. 630, 'Model for the reverse of a medal now being executed for the Madras Exhibition,' B. WYON; No. 633, 'Mrs. James Brotherton, enamel from life,' J. HASLEM; No. 639, 'Study from Life, enamelled on porcelain,' W. FORD; No. 652, 'Isabella Ker Gordon, after Sir Joshua Reynolds, enamelled on porcelain,' W. FORD; No. 690, 'Miss Sperling,' J. HARRISON; No. 716, 'The Hon. Theodosia Vyner,' J. HAYTER; No. 717, 'Portrait of Mrs. E. A.,' E. ARMITAGE; No. 755, 'Interior of a Kentish Cottage,' D. W. DEANE; No. 818, 'The Old Hostelry Yard, Fair Day,' W. J. P. HENDERSON; No. 856, 'The Avenue to the Mill on the Avon, Brent, Devonshire,' J. GENDALL; No. 863, 'Grand Canal, Venice, after J. M. W. Turner, R. A.,' J. T. WILLMORE, A.E.; No. 866, 'Her Highness the Duchess of Hamilton, after Buckner,' (not published), R. J. LANE, A. E.; No. 867, 'Viscountess Goderich, after Millais' (not published), R. J. LANE, A. E.; No. 869, 'St. Luke painting the Virgin, from the original painting by Steintle, in Her Majesty's collection,' L. STROCKS, A. E.; No. 873, 'View from the Mount of Offence, looking towards the Dead Sea and the Mountains of Moab, morning,' W. H. HUNT; No. 880, 'The Bottom of the Ravine at Inkermann, from a sketch taken on the spot four months after the battle,' E. ARMITAGE; No. 881, 'The Good Shepherd,' W. DYCE; No. 883, 'Portrait of a Lady,' T. SENTIES; No. 895, 'Interior of a Deewan, painted on the spot,' T. B. SEDDON; No. 914, 'Off the Calf, Isle of Man,' W. E. BATES; No. 917, 'Daughters of the Hon. Gerald Talbot,' J. GILBERT; No. 943, 'Welsh Peasants,' E. J. COBBETT; No. 948, 'Judith,' W. F. WOODINGTON; No. 951, 'A Triton,' T. DALZIEL; No. 944, 'Evening on the Nile,' F. DILLON; No. 985, 'The Shepherd's Sabbath Evening,' A. W. WILLIAMS; No. 1001, 'Autumn Fruit,' Mrs. V. BARTHOLOMEW; No. 1002, 'The Sphinx, Gizeh, looking towards the Pyramids of Sakhara,' W. H. HUNT, &c., &c.

THE ROYAL PICTURES.

THE VISIT TO THE NUN.

Sir C. L. Eastlake, P.R.A., Painter. S. Smith, Engraver.
Size of the Picture, 2 ft. 3½ in. by 1 ft. ½ in.

Mrs. JAMESON in the introduction to her volume, "Legends of the Madonna," has truly and beautifully remarked:—"A picture or any other work of Art is worth nothing except in so far as it has emanated from mind, and is addressed to mind. It should, indeed, be read like a book. Pictures, as it has been well said, are the books of the unlettered, but then we must at least understand the language in which they are written. And further,—if in the old times it was a species of idolatry to regard these beautiful representations as endued with a specific sanctity and power; so, in these days, it is a sort of atheism to look upon them reckless of their significance, regardless of the influences through which they were produced, without acknowledgment of the mind which called them into being, without reference to the intention of the artist in his own creation."

Now, whatever the purpose of Sir Charles Eastlake may have been in this touching and most beautiful composition, we have no idea he had any intention of putting it forth as an argument in favour of monastic life—a life, we are so heterodox as to believe, altogether opposed to the doctrines of the Divine Founder of the Christian faith and his immediate followers, who taught us "to use the world without abusing it," and to "let our light so shine before all men, that they may see our good works." But we are not about to preach a homily on the conventual system, and perhaps should not have referred to it at all if the picture did not seem to invite the observation. We read it, however, in a way far from favourable to monasticism. The visitors to the Nun, we presume to be a married sister and her two children—there is also, it may be inferred, another visitor not introduced into the picture, but who has some interest in the visit. The married sister is evidently urging upon the attention of the recluse some topic to which she listens with emotion, though her head half-turned away, and her downcast eyes, show but little inclination to yield to the argument, whatever that may be. The elder of the children is, in the expression of her look, a silent pleader in the same cause, while the younger child holds up a small nosegay of wild flowers, as if to indicate how much there is in a world beyond the dreary walls of the convent from the enjoyment of which, no less than from the sacred lessons all the works of nature teach us, the Nun has voluntarily excluded herself. These are the principal characters in the story: but there are others bearing a part in it. The old nun to the right is closing the door against some unseen individual—certainly not the father confessor; possibly—though not with much probability, considering that such a visitor could scarcely have penetrated so far into the convent, unless by the influence of bribery—one who feels especial interest in the young recluse who has "put lover, friend, and acquaintance out of her sight." Another nun perambulates the cloisters in the distance, engaged in the perusal of some devout book; and above her head is a pair of birds in joyous liberty, suggesting the idea of that liberty which is denied to the inmates of the institution. The fresco picture on the wall represents the scriptural story of Mary and Martha; and on the table is an hour-glass with its sands almost run out, indicating that the time of separation is at hand.

This picture, which was exhibited at the Royal Academy in 1846, is rich in feeling and sentiment exquisitely expressed—a "subject lighted up with that sacred effulgence for which the old masters devoutly prayed, and with which they were endowed, according to their adoration of their art."

The colouring and execution of the painting are in harmony with the deep purpose of the narrative it describes: the picture is undoubtedly one of the President's most charming works. It is in the collection at Osborne.

S. SMITH. SCULPT.

THE VISIT TO THE NUN

FROM THE PICTURE IN THE ROYAL COLLECTION

SIR C. L. EASTLAKE, P.R.A. PINXT

THE EXHIBITION OF THE SOCIETY OF PAINTERS IN WATER-COLOURS.

THE present exhibition presents a higher degree of uniform excellence than we have seen on these walls for some years past. The society is fortunate in numbering among its members figure-painters of power, originality, and great diversity of talent. We find resuscitated into effective activity men who seemed to be forgotten, because of late years they have made no sign: we are most happy to assist at the celebration of their revival. Of the landscape and genre art we need not speak; the former, especially, has always been of the rarest excellence. Perhaps the most substantial proof that can be offered of the public estimation of the collection is, that it was soon after the opening of the exhibition nearly all sold. Many of the smaller figure-pictures are of such excellence as to induce the wish that they were large instead of small. There are but few works now to remind us of the older school of water-colour; yet there are some; and among these the works of David Cox are the most notable: he is the father of this section of the profession: he has resolutely passed the last half century of his sketching seasons at Bettws-y-Coed, eschewing all innovations of colour and the meretricious scenery of sunny Italy. But we hold a catalogue of three hundred works;—turn we, therefore, to No. 3, 'The Vale of Dolwyddelan, North Wales,' by D. Cox, jun., in which we observe that in carrying out the principle of materiality—in communicating substance to the objects of the composition—all atmosphere is lost; so that the more distant hills look on the same plane as the nearer ones: it is a wild and romantic subject, with much of the impress of reality. No. 4, 'Before Sunrise, Loch Torridon, Ross-shire,' W. TURNER, is a drawing that reminds us of the works of the late G. Robson; the ferns and herbage in the foreground are worked up with the greatest nicety; the sky, distant mountains, and lakes, are painted in cool tones appropriate to the hour of the day. No. 9 is a life-sized head, that of a 'Sabine Peasant Woman' by CARL HAAG, very rich in colour, rustic and natural, without any of the attributed refinement which is erroneously communicated to studies of Italian peasantry. This artist introduces the novelty of painting life-sized heads in water-colour. No. 10, 'Composition—Sicily,' T. M. RICHARDSON. A large drawing, and although entitled a "Composition," it has all the reality of a veritable locality. A village, from which a group of peasants is passing out, is on the right; a rapid stream running down the centre of the picture, a range of lofty broken hills to the left, and an elevated eminence crowned with a castle, in the rear, are the materials of the subject: all are characterised by great richness and truth of colour. No. 13 is the solitary 'Capri,' W. EVANS, which, seen from any point, can never be mistaken: it seems here, however, to be represented too near the mainland. 'Oyster Dredging off the Mumbles Head, South Wales,' by E. DUNCAN, is a work of great merit; the movement of the water, and the swing of the boats, are strikingly true, and equally faithful are the sky and the aerial medium; in short, the picture throughout leaves nothing to be desired. No. 20 is a very elaborate study of stones within high-water mark; the drawing, by J. P. NAFTEL, is catalogued as 'Collecting Vraic on one of the natural Breakwaters thrown up by the heavy seas from the Atlantic, Guernsey:' it is extremely successful,—but, after all, this kind of thing is very mechanical. FREDERICK TAYLER exhibits No. 23, a striking composition, 'Huntsman's Boy and Bloodhounds.' There are two couples of these animals, and nothing can be more naturally true than the points of the species as here prominently shown: the heavy stupid head, awkward limbs, and ill-proportioned body are identical with the reality. It is a fine drawing, devoid of all vulgarity of treatment. No. 24, 'Italian Peasant Woman,' A. FRIPP. A charming little story, elegantly drawn, and in a low tone of colour. No. 27,

'A Dutch East-Indianman hove down,' by G. H. ANDREWS, shows the large hull of the vessel in shallow water in the middle of the composition: it is an ordinary and simple manner of bringing forward any large object, but the composition is very elaborately carried out; the right-hand section is full of appropriate material, which, we think, in some degree detracts from the importance of the ship. 'Flowers,' V. BARTHOLOMEW, numbered 30, is a charming bouquet of azaleas, tulips, and roses. No. 33, 'Richmond Castle, Yorkshire—Sunset,' G. FRIPP, is a production of a high degree of merit. No. 34, 'Laud's End, Cornwall,' G. FRIPP. The sketch is taken from a ledge of rock to the right of the promontory: the water is coldly painted, but we have rarely seen the long "sweep" of the wave as it rushes on the rocks more effectively represented. No. 37, 'The Standard Bearer,' JOHN GILBERT, is a figure that would have graced the royal cause at Marston Moor or Worcester; it is masterly in character and colour, and enfeebled by no *petitesse* or quaint conceit: the figure reminds us strongly of one Diego Velasquez—that figure more cavalier than painter, grouping with Vandyke, Rubens, Rembrandt, and Jordaens in the portrait collection at Florence. No. 38, 'Hay-making—Priory Park, Reigate,' E. DAVIDSON, is extremely agreeable, as having much of the spirit and freshness of nature, and being entirely free from affectation. No. 42, 'Still Pool, Lynton, North Devon,' W. C. SMITH, is one of the picturesque pools on the Lynton, enclosed in by rocks and trees: the subject is well chosen, and receives justice in its treatment; the water especially is well painted, being much more transparent than we usually see it in this department of art. No. 46, 'The Hotel de Ville, Brussels,' W. CALLOW, is an oblique view of the façade, to which the artist gives the appearance of great length by introducing some of the adjoining houses: the details of the architecture are very scrupulously made out. No. 47, 'A Mountain Stream, Glen Nevis, Invernesshire,' T. M. RICHARDSON. This, like the other work by the artist, which we have just noticed, is also a large drawing: it contains an abundance of the material peculiar to the Highlands, brought forward with a due appreciation of its characteristics. No. 51, 'Feeding the Chickens,' WALTER GOODALL. This, and two other drawings by the same hand, No. 63, 'The Grandfather's Visit,' and No. 118, 'The Shrimpers,' show that Mr. Goodall is on the high road to excellence: he studies nature closely, is careful in execution, and judicious in the use of his pigments: we should be better satisfied, however, with a little more transparency: he has at present too great a tendency to heaviness. No. 52, 'The Evening Gun at Castle Cornet, Guernsey,' J. P. NAFTEL, is, we think, the best drawing that has been exhibited under this name. Instead of a title to No. 60—a large drawing by W. C. SMITH—the catalogue supplies a quotation from Byron:—

"Clear, placid Leman! thy contrasted lake,
With the wide world I dwell in, is a thing
Which warns me with its stillness to forsake
Earth's troubled waters for a purer spring," &c.

The view is that which comprehends with the castle of Chillon a large extent of the shores of the lake, closed by the snowy peaks of the Alps. Chillon is too much insisted on as a point—it were better that the eye should seek Chillon than that Chillon should importune the eye, because, as a prominent spot in the composition, it becomes but a speck in comparison with the mountainous masses by which it is dominated; the general treatment however of the subject communicates to it a considerable degree of grandeur. No. 67, 'Porta Nigra, at Treves,' by J. BURGESS, junr., represents an architectural relic of great interest, to which is communicated, from the manner of the drawing, a palpability of substance and reality. No. 68, E. DUNCAN, is a broad, bright, daylight drawing, showing Spithead, with part of the Fleet, from Ryde Sands, with, curiously enough, a sheep episode in the foreground. The floating castles are lying in perfect tranquillity between the spectator and the mainland—but *revenons à nos moutons*, the poor animals are landed from boats, and look scared at the novelty of their position. No. 69,

'Close Gate and Widows' College, Salisbury,' W. CALLOW. A picturesque bit of architecture, rich in colour, and painted under a powerful daylight effect. No. 72, 'The Old Knight's Blessing,' W. COLLINGWOOD, is an ancient chamber, appropriately furnished, as of the seventeenth century. In No. 73, 'The Pass of Glencoe,' G. FRIPP, the middle and nearer passages of the subject are successfully made out, and the general dispositions constitute a truthful picture of the locality. No. 74, 'The Mole, near Dorking, Surrey,' J. P. NAFTEL. The character of the gentle Mole is readily recognised here, but the foliage is exorbitantly green, the colour has a metallic rather than a vegetable hue. No. 78, 'Autumn Flowers,' V. BARTHOLOMEW, is a vase of China asters, most skilfully drawn, and charmingly grouped as to colour. No. 83, JOHN GILBERT, is a subject semi-historical. 'Her Majesty the Queen inspecting the wounded Coldstream Guards in the Hall of Buckingham Palace.' This subject would of course be seized upon for a picture—a faithful record of this incident on canvass would be a fitting subject for the walls of the Houses of Parliament. The Court occupies the right section of the composition, and the members of the Royal Family that are present with the Queen and the Prince, are the princes and princesses, and the Duchess of Cambridge, with equerries and ladies in waiting on her Majesty and his Royal Highness. We presume that the artist has given value to his picture by having drawn from the men themselves. He has very judiciously introduced red very sparingly into the mass of soldiers occupying the left of the composition; the mass is consolidated by the use made of the grey coats of the men, but these are generally too dark, even when new they are not so dark, and when old are comparatively a light grey; some of the men who have been most severely wounded are seated, but the mass is standing, and her Majesty addresses a stalwart figure of the Grenadier company, if the right-hand company of the Coldstream battalions is still so called. There is a marked anomaly in the picture we cannot pass by without observation, which is, that a soldier never removes his tschako or helmet in the presence of his superior officer or even of his sovereign; the officers very properly wear their bearskins, but all the men are uncovered, and it is somewhat absurd to see the man addressed by Her Majesty saluting without either a forage cap or bearskin on his head. We know not how these men approached their sovereign upon this occasion, they may have been ordered to remove their forage-caps or bearskins, but they never could have been ordered to salute while uncovered—a soldier under such circumstances stands to "attention." We know not whether the artist was present; if he were, and he saw the ceremony as he has painted it, he is quite right thus to illustrate it. In the dark and solid group before us there is much of earnest reality, and the greater truth because in these various heads no attempt at undue refinement, no essayed expression of sentimental heroism. As a whole, the composition is admirably brought together; but we must press on with our already impatient numbers, and proceed accordingly to No. 85, 'Naples from the Strada Nuova,' T. M. RICHARDSON, in which the lines run very effectively, but the everlasting sunshine and idle blue sea of Italy eventually induce a soporific tendency, which neither human nor Neapolitan nature can resist. No. 89, 'Market-day, Genoa,' J. HOLLAND, is a spirited sketch, made upon the spot. Nos. 93 and 94 are two drawings by the same hand, D. Cox, Junr., but very different as to their success respectively. The former is 'A Ferry on the Tay at Logcraik,' a little place above Dunkeld where you may live, upon eggs, chickens, porridge, oatcake, whiskey-punch, and occasionally get a contraband salmon. The other is 'On Wimbledon Common,' somewhere near London, in Surrey, perhaps, but this is infinitely superior to the other—it is a heath scene, forcible and effective. No. 100 is a subject that every figure-painter that visits Rome commemorates in his sketch book; 'The Pifferari,' by CARL HAAG; they are, as usual, playing before the figure of the Virgin. No. 106 is 'The Dochart River in its most impetuous state after

rain—Ben Lawers in the distance,' H. GASTINEAU. There is, we doubt not, much truth in this representation of the swollen river; it is a large drawing, and the rest of the composition is very conscientiously rendered. No. 107, 'The Pope's Mint and Part of the Pope's Palace at Avignon,' No. 108, 'Chateau at Dieppe,' J. BURGESS, JUN. A pair of drawings, rather large in size, painted with a free pencil, and sober in colour, yet true to nature. No. 111, 'The United Service—A Council of War,' H. P. RIVIERE, shows two pensioners, one representing Greenwich and the other Chelsea, following on a map the operations of the allied armies. No. 112 is a drawing of much interest, by G. FRIPP, entitled 'Part of the Ruins of Corfe Castle—The Artisan's Tower.' It is a small drawing of a broad daylight effect, all but weak from the want of sensible shade, but most carefully worked out—there is no stone in the crumbling wall that has not had its share of attention at the hands of the painter. No. 114, 'A Winter's Sunset on the Banks of the Avon,' C. BRANWHITE. It had been better to have omitted the Avon from the title of this drawing, for nowhere is the Avon so wide as represented here. With respect to the drawing, it is a charming production. No. 115, 'A Fête Champêtre,' G. DOUGSON. This is a misnomer, because the festivities are not *champêtres* but held in the garden of a superb chateau—the title, however, has little to do with the high excellence of this picture, with respect to which one fact impresses us somewhat deeply; that is, that right and left there are—here mediocre, there, inferior, there again positively bad—drawings marked as disposed of, while this charming work is still in the market: it is sterling in manner and effect, most graceful in every passage of its composition, and elegant in every form of expression. The artist does himself an injustice if he does not continue to paint compositions of this class. No. 119, 'Morning—a French Lugger shortening sail,' by E. DUNCAN, is a drawing of much merit. The reason is obvious why she takes in her foresail—the sea is rising and we feel the freshening breeze: this description of morning is admirably painted; we cannot wait to see how these fellows handle their mainsail—that breadth of canvas is difficult to deal with in a gale of wind. No. 121 is a close river scene by C. BRANWHITE, catalogued as 'On the River Teivi, near Newcastle-in-Eulyn, South Wales;' it is painted generally with breadth and well coloured, but it must be admitted that there would be more of nature in it if the masses of foliage were less flat, for faithful representation, enough has not been done. 'The Tyrolean Bride,' No. 122, CARL HAAG, is a single figure, that of a Tyrolean peasant woman kneeling at prayer; it is impossible to speak too highly of the minute finish in this drawing, especially of the head. No. 123, 'The Market Strasse and Rath-house, Hanover,' W. CALLOW. In Hanover there is but little of the picturesque—the buildings shown in this drawing are perhaps the most eligible; the oldest houses have precepts from the Bible inscribed on them, and may be as old as Knox's house in Edinburgh, which, if we remember, has also an inscription. 'The Homestead,' No. 124, C. DAVIDSON, is a picture of an English Farm Yard and buildings, apparently very faithfully drawn from the locality it is presumed to represent. In No. 125, 'The Return—in sight of Home,' JOS. J. JENKINS, is a ferry-boat, among the most prominent of the passengers in which is a small party of French soldiers, Zouaves, who express their joy at the sight of their native place; the figures are small, but the incident is impressive: by the same artist, No. 129, 'Asleep,' is a small domestic agroupment, a mother watching the cradle of her sleeping child; and in a pendant to this, No. 141, 'Awake,' we recognise the same mother and child, but the latter is now removed from the cradle to the knee of the parent. Both of these compositions are distinguished by that graceful sentiment which this artist always imparts to his illustrations of the natural affections. No. 127, by S. P. JACKSON, is an 'Old Hulk at Plymouth—Sunset,' a work of great excellence, in which the sunset effect is sustained by much sweetness of colour. No. 128, 'Driving the

Flock,' by D. COX, is a heath subject, in which appears a flock of sheep driven by a man: when we look at some of the drawings of this artist containing figures, we marvel how an engraver of the present day would set about committing these works to copper. This drawing is very low in tone, and, with the exception of a little blue entirely without colour, no artist has painted so much of effect and so little of object as we see in these works. No. 133, 'The Vale of Clwyd from St. Asaph,' by D. COX, JUN., presents the view under the aspect of a cloudy summer-day; it is a subject of much interest. This is followed by perhaps the most extraordinary work that has yet been painted by JOHN F. LEWIS; it is catalogued 'A Frank Encampment in the desert of Mount Sinai, 1842—the Convent of St. Catherine in the distance.' The picture comprises portraits of an English nobleman and his suite, Mahmoud the Dragoman, &c., &c. Hussein Sheikh of Gebel Tor, &c., &c. In contemplating a work like this it is difficult to understand the physiology that can dwell on a work of this size without being utterly exhausted by the enormous amount of monotonous stipple necessary to the completion of such a work up to a degree of such exquisite *finesse*. The simple statement is, that an Englishman, encamped in the desert, is visited by a Sheikh, who comes in state with camels and attendants; the Englishman remains reclining on his carpet and cushions, while the Sheikh stands respectfully at the edge of the carpet. A conversation is carried on between them, which is interpreted by the Dragoman, with some auxiliary action. Almost any section of the composition would form a picture. The material strewn round the reclining figure is of the most varied description; the left hand rests upon an English terrier, and a Skye behind him sits up holding a small stick or whip; the little factory boys of Paisley and Manchester would scream at the imitation of the carpets and draperies, and the spectator, when tired of imitative textures, may pick up and read the *Galignani* which his Lordship has just thrown down. The head of the principal figure we recognise as a portrait sketch exhibited some time ago. The Arab personal characteristic seems to be most faithfully portrayed—especially in a near figure seated on the ground; the staid and respectful dignity of the visitor is also remarkable, but the volubility and action of the Dragoman have something of occidental manner in them. We cannot help thinking that reflected light is too extensively used in this composition; there is no effective shade, dark, or gradation of tone, and for want of atmosphere the details of the mountain vie in proximity with the draperies of the tent. It is marvellous in minute manipulation; the principle of execution being to describe each object individually as it is presented to the eye, without recourse to the usual licenses which give prominence to certain objects in preference to others, and serve to retain all the objects in their respective places. No. 135 is an elegant fragment from 'Taormina, in Sicily,' by T. M. RICHARDSON. No. 136, entitled 'Il Penseroso,' is a composition of much classic feeling, by F. O. FINCH; the *Penseroso* of the scene is a man reclining on the grass. Near this, Nos. 136 and 137 are two interesting works by T. M. RICHARDSON, 'Beach at Hastings, Sussex,' and 'The Rest, Highland Moors.' No. 140, 'Peat Gatherers, North Wales,' D. COX, is another of those clouded, storm-threatening effects, which being so often repeated would almost induce the belief that this artist has never seen the sun. No. 144, 'The New Song,' is a figure-subject, the best we think that its author, O. OAKLEY, has ever exhibited: certainly the most aspiring, as we remember under this name scarcely anything but gipsies and mendicant organ-boys. A council of three young ladies is held upon 'The New Song;' one sings, while the others listen. The figures are very well drawn, and the features life-like and expressive; had the costume been a little less of what we see every day, it would have added to the interest of the picture. The composition is very full; the multiplicity of objects diminishes the importance of the impersonations. No. 147 is a theme, by S. PALMER, from 'Comus:'—

"Attendant Spirit. Immured in cypress shades the sorcerer dwells.

You may
Boldly assault the necromancer's hall,
Where if he be, with dauntless hardihood
And brandished blade rush on him, break his glass,
And shed the luscious liquor on the ground," &c.

This is a dark composition, reminding us in colour and effect of those much-quoted people called "old masters." We see the band of Comus through the trees, and near are the brothers conducted by the spirit. There is a pendant to this drawing by the same painter, No. 153, 'The Brothers, in Comus, Linger under the Vine;'

"Two such I saw what time the labour'd ox
In his loose traces from the furrow came,
And the swink'd hedger at his supper sat;
I saw them under a green mantling vine,
That crawls along the side of yon green hill."

The composition in this is better brought together than in the other; the only objectionable passage consists of the palpable sunbeams, which shoot over the neighbouring bank. No. 150 is a life-sized study of the head of a child by CARL HAAG; it is entitled 'Roman Flower-Girl.' The features are admirably coloured, but the eyes are large enough for a head twice the size. No. 151, 'Lake of Lucerne—Sunrise,' W. C. SMITH, is a drawing displaying masterly skill, but we feel the lake less as water than as mere colour; the sky, distant mountains, and atmosphere, are fully successful. No. 152, 'East Cliff, Hastings—Sunrise,' by S. P. JACKSON, is a charming example of simplicity and facility. No. 154, by H. P. RIVIERE, is an Irish subject, 'Don't say Nay, charming Judy Callaghan'—(we cannot compliment the artist on his determination of title), of which the point is the proposition of a glass of whiskey by a youth to a damsel. We instance the drawing simply to mention the extreme brilliancy of the colouring of the girl's features. No. 156, 'The West Front and Spire of the Cathedral of Dijon,' by J. BURGESS, JUN., is a drawing extremely spirited and accurate in architectural detail. No. 157, S. P. JACKSON, is a drawing of the utmost excellence; it is 'Cader Idris from the Sands at Barmouth.' The mountains rise on the left section of the composition, a brig is lying on the sands towards the centre of the picture, and the nearest passages are studded with rocks, the substance and tone of which materially assist the distances. This is one of the best coast-pictures we have of late seen; the mellowness and harmony of the colour are most captivating. No. 163, by MARGARET GILLIES, is a single figure, that of a woman contemplating the glories of the heavens. She rests against a fragment of architecture, erect and looking up. It is catalogued as 'From Marcello's Anthem'—

"I eveli immensi narrano,
Del grande Iddio la gloria."

It were scarcely necessary to have recourse to the Italian text for the subject, for the English, "The heavens declare the glory of God," is more impressive. The figure is somewhat heavy; were it less material, it would better support the poetry of the extract. No. 175, 'View in the Forum at Rome, from the School of Xanthus—done on the spot,' by A. GLENNIE, is one of the best drawings we have for some time seen from the ruins of Rome; it is highly finished and very effective. No. 166, 'On the River Dee, North Wales,' by C. BRANWHITE, is very deficient in the breadth which we usually see in the works of this painter—the spectator feels on looking at it that there remains yet much to be done in order to reconcile the parts. In No. 168, 'Sunrise on the Jungfrau, from the Wengern Alps,' W. COLLINGWOOD, the whole of the lower part of the drawing is in shade, in order to strengthen the sunlight which strikes the lofty peaks that pierce the morning sky—hence by this contrast of concentration is produced depth and force. No. 176, 'A View in Nuremberg,' H. BRANDLING, is sufficiently characteristic to remind the spectator of the quaint and lofty houses of the Cisalpine Venice. No. 177, 'The Students,' is a composition of two figures by MISS GILLIES, suggested by the verse of Tennyson—

"Those that eye to eye shall look
On knowledge."

... In their hand
Is nature like an open book."

The conception presents apparently a father and daughter, occupied in philosophical inquiry. In the daughter there is much sweetness of expression. No. 182, is a 'Scene on Loch Katrine, Perthshire.'

"High on the south huge Ben Venue
Down the lake in masses threw
Crags, knolls, and mounds, confusedly hurl'd,
The fragments of an earlier world."

This subject is brought forward as a very large drawing of extremely picturesque character, showing combinations which cannot be surpassed by any effort of the imagination. No. 184, 'Buck Baskets on the Thames,' C. BRANWHITE, is a very sparkling production, containing an agreeable sequence of gradations, with harmonious colour. No. 187 is a 'Gypsy Girl,' by O. OAKLEY, a drawing of much merit, but the figure is too showily dressed; the broad-brimmed beaver is under any circumstances not a characteristic property of the tribes; the features would be much improved if the whites of the eyes were reduced. No. 190, 'Beeches at Windsor,' W. SMITH, has much of the reality of nature; and No. 192, 'Richmond Castle, Yorkshire,' C. DAVIDSON, is felicitous as an essay in local colour. The screens contain many beautiful works, but we must be content to record only the titles of some of the most striking of these: as No. 204, 'Going to the Chase,' G. DODGSON; No. 207, 'Keep of Raglan Castle,' H. GASTINEAU; No. 208, 'The Stranger,' F. W. TOPHAM, a study of a negro boy—a drawing of great merit; No. 210, 'Herd Boy—Braes of Loch-Aber, Invernesshire,' T. M. RICHARDSON; No. 212, 'Fruit,' W. HUNT; No. 213, 'Capuchin Monks relieving Pilgrims,' ALFRED FRIPP; No. 214, 'The Thames at Twickenham,' GEORGE FRIPP; No. 215, 'Come Along,' JOS. J. JENKINS—a drawing of great brilliancy, showing a French peasant woman crossing a stream by stepping-stones, followed by her child; No. 219, 'Fruit,' W. HUNT, the grapes painted with extraordinary truth; No. 222, 'A Tale—Beggars of Ober Franken,' F. W. BURTON, an exquisite drawing; No. 227, 'North Entrance of the Palace of Andrea Doria, Genoa,' J. HOLLAND; No. 230, 'Arundel Castle, Sussex,' WILLIAM CALLOW; No. 231, 'A Pifferaro,' ALFRED FRIPP; No. 235, 'Landscape—Morning,' F. O. FINCH; No. 226, 'The Ministering Spirit,' MARGARET GILLIES; No. 238, 'The Gaugers are Coming,' F. W. TOPHAM; No. 240, 'Wind and Rain,' D. COX; No. 243, 'Fresh from the Garden,' O. OAKLEY; No. 245, 'Confluence of the Trent and Ouse with the Humber, from an eminence near Brantingham, Yorkshire,' H. GASTINEAU; No. 246, 'Neapolitan Peasant Girl,' ALFRED FRIPP; No. 248, 'The Contarini Palace, Venice,' W. CALLOW; No. 253, 'A Bit of Mont Blanc,' W. HUNT; No. 255, 'Moonlight,' J. HOLLAND; No. 256, 'An Itinerant,' W. HUNT; No. 259, 'The Water Party,' J. DODGSON; No. 263, 'The Return from Hawking,' FRED. TAYLOR; No. 264, 'L'Allegro,' J. M. WRIGHT; No. 267, 'Horses Drinking,' D. COX; No. 268, 'The Ante-Room,' W. COLLINGWOOD; No. 269, 'Roses and Convolvulus,' V. BARTHOLOMEW; No. 270, 'Dead Game,' G. ROSENBERG; No. 274, 'Fruit,' W. HUNT; No. 280, 'A Winter's Afternoon in the New Forest,' E. DUNCAN; No. 281, 'Hill-Nature, Highlands of Scotland,' FRED. TAYLOR; No. 284, 'The Garden Terrace,' G. DODGSON; No. 288, 'Youth and Age,' F. W. TOPHAM; No. 290, 'A Mountain Torrent,' G. DODGSON; No. 291, 'The Madrigal,' by the same painter; No. 296, 'Titian Visiting the Studio of one of his Pupils,' &c. We think this will be admitted to be the most sparkling series that has been seen here for years past. It is true we miss some of those who, until recently, have contributed so much to the interest of the exhibition—none perhaps so much as Cattermole; but, in respect of figure-painters, those who are members of this society are men of the highest distinction. Time was when this was essentially a society of landscape-painters—when figure-drawing was regarded an insufferable impertinence; but in looking round these walls we are compelled to admit that the education of the water-colour artist must now be as careful as that of the painter of history.

THE EXHIBITION OF THE NEW SOCIETY OF PAINTERS IN WATER COLOURS.

THE catalogue of this season gives a list of three hundred and forty-nine drawings, among which, although the most eminent of the landscape painters show in various works the quality whereby they are distinguished, there is no great effort in this department, the subjects being generally common-place and unambitiously treated. The figure painters of the society, although the remarkable works in this walk are not numerous, evince more spirit and speculation; indeed when we consider the amount of labour and the length of time necessary to perfect some of these compositions, it were not reasonable to expect each year more than two or three such productions, supposing that the artist did nothing but work upon these drawings. In looking round a collection like this it is not difficult to see that the majority of the works are brought forward in the best marketable form; and that such should be the case is not so much to be charged to the fault of the painter as to the tastes of his patrons. In many of the minor works are to be found the finest qualities in water-colour Art—the deficiency, therefore, is not in executive power, but in the selection of subjects and in imaginative resource. Among the following examples which we select for notice is continually signalled the excellence of which we speak. No. 3, 'Entrance to the Grand Canal, Venice,' W. WYLD. There is a dreamy character about this drawing which gives it the feeling rather of a poetic composition than an essay proposing a reality. It is sunny, and the buildings are in as good condition as in the days of the historic doges. We have St. Mark's upon the right, but the famous temple is too large, according to one of those luxurious licenses of painters and poets. The markings and divisions of the principal masses are too absolute. No. 7, 'The Fisherman's Daughter,' J. H. MOLE. She is on the coast, with the open sea behind her, bearing a basket on her head. It is a characteristic study. No. 16, 'A Kiss,' JOHN ABSOLON. This is suggested by a French print; it presents a group at a stile—a guardsman of the days of the earlier Georges, wearing an 'Egham-Staines-and-Windsor,' that is, the three cocked-hat of those days, in the act of kissing a not unwilling country damsel; he should have taken off his uncouth hat, being a most inconvenient headgear for a *tête-à-tête* so close. The title is not happy, and the maiden, 'simple tho' she stands there,' looks very much as if she had asked for the salute. No. 17, 'The Upper Lake of Killarney,' W. BENNETT. There is little colour in this drawing, but the greys and greens are so judiciously dealt with, that the warm tints acquire a double force. These works remind us continually of the early English school of water-colour drawing. In No. 23, 'The Rugged Bed of the Lynn,' D. H. MCKEOWN, the masses of rock in the drawing constitute the subject; the trees are secondary but yet treated too much as a mere base—had the tone of the rocks been reduced, they had been more a part of the composition than they are. No. 26, 'Nutting,' EDMUND G. WARREN. The subject is a section of a woodland path skirted by trees, which are carefully drawn. The title is realised by two children plucking nuts. No. 27, 'Griselda,' E. H. CORBOULD. A single figure, successful as a study, but not as Griselda; she bears a cruse of water, but there is no colouring of the poetry of Chaucer. The features are distinguished by the utmost delicacy of character, and the extremities are drawn with the nicest accuracy. The refined hues of the drapery are faced by the cold breadth of the background. 'Black Gang—Isle of Wight,' JAMES FAHEY. It is high-water, and the rocks forming the subject are made out in all the wealth of their summer herbage. The drawing is a close imitation of the locality, and the stratified rocks have been very assiduously worked out. No. 38, * * * * W. LEE. The place of a title to this drawing is supplied by a verse from "The Christian Life" of Montgomery. There are two figures in the picture—a French peasant woman

and her child, as if at public worship. The figures are most agreeably treated, and the natural simplicity of the incident is the great charm of the work. No. 43, 'Old Eastbourne and Pevensy Bay,' J. W. WHYMPER. We are placed on the ascent towards Beechy Head at the back of Eastbourne church. The subject is at once recognisable, but the distance might have been a little more definite. No. 44, 'The Seaside,' S. COOK. A small drawing, charming in colour. No. 50, 'Ante-chamber of the Tribunal of the Inquisition in the Ducal Palace, Venice,' L. HAGHE. The subject is from Daru's "History of Venice," being the capture by the officers of the Inquisition of the head of some noble family, one of whose members has offended against the laws of the State. The story is clearly that of an arrest, but the details are not so perspicuous as are generally those in the productions of the artist—otherwise, the picture is distinguished by the rarest qualities of Art: accurate drawing, powerful and appropriate expression, beautiful colour, with breadth and substance. The head of the house is arrested; his wife and child plead in vain for his release, and the other members of the household are overwhelmed with grief; this is all very clear, but if the subject assumes the cause of the arrest, this does not appear. The same artist exhibits—for him an unusual kind of subject—'Venice, il Molo,' No. 55, that view which places the Ducal Palace on the right of the spectator, looking towards the library. It must have been the novelty of the subject which attracted the artist from his other topics, that are really original. 'Addio, Venezia,' charming as thou art we willingly forsake thee for 'The Town Hall of Ondenarde—Meeting of the Corporations,' a third large drawing by Mr. HAGHE, in which we find ourselves among a company of sleek and well-fed burghers, in the costume of the seventeenth century, that which this artist describes so well. This is the class of subject which he has made his own; in action, expression, and diverse character, these figures are equal to any which he has ever conceived. No. 69, 'Forest Scene—Autumn,' W. BENNETT. The firm and substantial manner of this artist is admirably adapted for the representation of the old and gnarled oaks which he so frequently paints. The substance of his manipulation is amply shown here. No. 77, 'Rebekah first sees Isaac,' HENRY WARREN. The subject is from the twenty-fourth of Genesis, sixty-fifth verse: "For she had said unto the servant, What man is this," &c. The subject is treated in a feeling in which this painter is eminently successful—Rebekah is mounted on a camel, as are also her attendants, and the agroupment is relieved against a sunny sky, the light from which is broken with a fine effect on the figures and animals. It is the best production which the artist has of late years exhibited. No. 83, 'Polperro, Cornwall—Sunset after a Gale,' S. COOK. A drawing of great power, presenting only a section of sea-cliff at high-water, as seen under an evening effect. Nothing can be more successful than the colouring of the drawing, with respect to the evening effect; it is managed so skilfully that we are conscious of the light without feeling colour, a preference of which the spectator is never sensible when the picture he contemplates is vulgarised by powerful tint. No. 84, 'Gleaners—Aveley,' JOHN ABSOLON. A very sparkling composition, of which the subject is one extensive corn-field, wherein are numerous figures. No. 93, 'Rochester—Wind against Tide,' T. S. ROBINS. Such may be the conditions of the effect, yet the river at Rochester is not sufficiently wide to admit of an agitation equal to that of an extensive estuary under a strong breeze: it is, however, very like the locality. No. 96, 'The Weaver's Song—Midsummer Night's Dream,' ED. H. CORBOULD. This is Bottom with the ass's head; a daring theme as open to criticism on comparative anatomy. He is singing—

"The ousel cock so black of hue
With orange tawny bill," &c.

and dancing to his own music—the treatment is extremely simple, the figure being relieved against a breadth of dark background. The person, especially the limbs, are extremely well

drawn—but for Bottom the weaver the hands are much too refined. No. 99, 'The Mother's Lesson,' J. H. MOLE. The scene is a cottage in which a mother and child are simply circumstanced, according to the title; the lights are, perhaps, too much distributed for good effect. No. 105, 'The Baptism,' JOHN ABSOLON. The party are assembled round the font in church; the ladies are especially piquantes in dresses and character. No. 113, 'A Morning Breeze,' on the hills at the entrance to Looe Harbour, looking over Whitesand Bay, Cornwall. S. COOK. For its independence and originality of manner, we cannot praise this work too highly; the water particularly, although so minutely detailed, is by no means hard or broken up. There is throughout the drawing a charming sentiment; we might see the subject treated twenty times without any approach to the power which characterises this drawing. No. 117, 'Entrance Tower, Hurstmonceaux, Sussex,' J. W. WHYMPER. This is an oblique view of the gate towers, as seen from the brink of the ditch, but presenting the structures as much more massive than they really are, and the colour of the brick is richer than it is given here. It was one of the first brick mansions of its class erected in England. No. 121, 'The Fulfilment,' W. H. KEARNEY. "Why seek ye the living among the dead? He is not here, but is risen." The angel at the tomb of the Saviour is addressing these words to the women who visit the place and find the sepulchre vacant; the figures and their arrangement declare at once the subject. No. 127, 'Roselle Bay,' Jersey, THOS. S. BOYS. A production of much merit—agreeably managed as to colour and chiaro-scuro. No. 130, 'The Ugly Duckling,' (Andersen), C. H. WEIGALL. This is the well-known story from the German, in which the poor cygnet is abused by the entire circle of domestic birds, under the supposition that he is an awkward ugly duck; we find him here shrinking under the abuse of a proud turkey-cock, to the malicious satisfaction of the whole farm-yard. These fowls are drawn and painted in a manner truly masterly. No. 135, 'Aldbury Vale, near Guildford,' H. MAPLESTONE. This district and the neighbouring parts of Sussex are remarkable for the abundance and luxuriance of their oak timber; the character of the scenery is successfully described in this drawing. The spectator is placed upon an upland cornfield, below which extends an expanse of densely wooded country. No. 136, 'Haddon Hall and Bridge,' D. H. McKEWAN. Much credit is due to this painter for affording us a new view of Haddon. We have seen enough of the terrace and the interior—here we see the exterior of the edifice from the grounds. No. 142, 'View of Monte Rosa, Canton Valais, Switzerland,' T. S. ROWBOTHAM. A very large drawing, showing the objects from a pass overhanging the ravine. The large drawings of this artist are not at all so well composed as to chiaro-scuro as his smaller works; from the desire of bringing forward too much, the effect is enfeebled; the work is deficient in breadth and force, for which no prettiness of colour or manipulation will compensate. No. 143, 'The Back of Skiddaw, with Bassenthwaite Lake in the distance,' AARON PENLEY. The subject is divided as it were into two parts, one light, the foreground, and the other, the background, in shade. This looks artificial, and it is the more unfavourably impressive because the shade and atmospheric tones are so cold. The colour of the heath is too positive—it does not harmonise with the foreground tints. No. 152, 'Market Place, Unterseen—The Jungfrau, &c., Switzerland,' W. N. HARDWICK. The houses in this composition are admirably drawn; so careful are they, that the mountains beyond look unfinished, yet it is the best work we have lately seen exhibited under this name. No. 159, 'At Mullion, Coast of Cornwall,' JAMES G. PHILP. A drawing of great merit, extremely forcible and effective, showing simply an opening between two walls of rock, with a glimpse of light distance; in colour and breadth, the shaded portions of the subject are highly meritorious. No. 169, 'Kynance Cove at Sunrise, Cornwall—The meeting of the Tide,' S. COOK. The tide meets round a portion of the rock that has been separated from the

cliff, and this occasions the agitation shown in the drawing. The composition is characterised by much sweetness of colour. No. 175, 'Tintern Abbey,' JOHN CHASE. As a representation of this beautiful remnant of monastic architecture the drawing is most faithful; it is everywhere elaborated with the nicest care, and does ample justice to the proportions of the ruin. No. 179, 'Waiting for the Ferry,' J. H. MOLE, is perhaps the most agreeable production that has of late been exhibited under this name. It is rather a landscape than a figure subject, as presenting an extensive view of mountain scenery, deriving life from two figures—a woman and a boy waiting for the boat from the other side of the loch. No. 182, 'Pallanza, Lago Maggiore,' T. L. ROWBOTHAM. This subject has of late become a *cheval de bataille* and appears now every season from various points of view. It is accurate, sunny, and very square, wanting a proportion of shade to make it felt. No. 185, 'Ben Cruachan, Loch Awe,' is another well-studied theme by D. H. McKEWAN; the ben is seen beneath the gloom of a stormy sky, whence the clouds have descended so as to conceal the face of the mountain. It is a large drawing brought forward with much spirit. No. 191 is a figure picture, by HENRY WARREN. 'Hagar the Egyptian and her Son' put forth to wander in the wilderness. The mother carries the cruse of water on her shoulder, as Abraham placed it, and leads with her left hand Ishmael, who is looking back towards his late home. The bead of Hagar has been modelled from the Egyptian monuments, and in every other respect the theme is sufficiently pronounced—but it might be objected that Hagar is too young and Ishmael too old. 'Summer Shade,' No. 198, by EDMUND G. WARREN, is a very agreeable study of trees. The boles and branches, with the masses of foliage, seem to have been carefully made out from the reality, the leafage is fresh and free in colour and manipulation. No. 211 is an eccentric production by EDWARD H. CORBOULD, entitled 'Ye Lymnere his Dreame.' The point of the subject, as set forth in the catalogue, is perhaps described better than we can detail it. "Falling into a fitful and uneasy sleep, after a long protracted reading of varied and antagonistic character, he dreams of patrons of art departed for the Crimea, of himself as not having a leg left—of falling into 'the waters of oblivion,' and vainly struggling to call for the drags of the Humane Society, whose men are gone to Greenwich Fair." In brief, as far as we can understand the composition, it is a painted epitome of the artist's professional career, with an allusion to the substance and the spirit of his works. Under an unaffected title and modest description, the work should be by speculators patiently considered, for there is really much merit in it. The composition is full of fantastic device, pictorial, poetical, allegorical, and even political. No. 223, by E. H. WEHNERT, is the scene from Don Giovanni in which the Don gives the white knight his hand as a pledge of accepting his invitation to supper.

"Comment. Tu m'invitasti à cena,
Verrai tu cenar meco?
Don Giov. Verrò!
Comment. Dammi la mano in pegno.
Don Giov. Eccola! Ohime!
Comment. Cos' hai?
Don Giov. Che gelo è questo mai?
Da qual tremore insolito sento assalir gli spiriti."

Don Giovanni writhes in the grasp of the white figure, the statuesque bearing of which is very impressive. No. 228, 'The Baronial Hall, Goodrich Castle, on the Wye,' by EDMUND G. WARREN, is a very successful essay. The subject is a remnant of one of the few castellated edifices that were constructed of brick. We are on the shaded side of the ruin, to which importance is communicated by extending it to such dimensions as to cover the paper. It is well coloured, and detailed in a very masterly manner. We have seen much of the Tilt and its romantic Glen, but we have never seen any passage of the famous stream described with a more charming sentiment than in No. 237, by W. BENNETT, though the stream looks somewhat wider than in the reality. We stood here some time watching the heron, the hermit of the lonely streams, whose staid and contemplative mood bespeaks the security he

feels in the solitude of the place. The foliage is abundant, but they are not all oaks that shade the fitful Tilt. Does this artist feel himself feeble in painting any thing but oaks? No. 244, 'The Old Gate at Rotterdam,' by G. HOWSE, is a subject that has frequently been entertained by Dutch painters; but the passage here is made extremely busy by a multitude of boats and figures. The buildings especially are represented with great skill. To instance the repeated recurrence of a certain round of subject-matter, we extract a few of the titles on the page before us:—'Moat House, Ightham, near Tonbridge, Kent'; 'St. Maclou, Rouen'; 'Cookham on the Thames'; 'The Bridge at Bettws, N. Wales'; 'Calais Harbour'; and others scarcely less notorious. Our frequent observations on this subject may perhaps prompt the question—"Because certain subjects have been already painted, are they not to be reproduced?" It is not the repetition of subject-matter that is so irksome, but that the majority of the profession should think so little for themselves—a circumstance exemplified by the fact that when new ground is broken by an individual, it is at once exhausted by a crowd, who nevertheless continue to dwell upon the threadbare resource until something new is suggested.—But to proceed. No. 240, 'Murillo's Early School,' W. H. KEARNEY, presents the Spanish painter in his youth, drawing from such figures as he could induce to sit to him in the streets. It is an agreeable incident, which might have been wrought into a picture of great power, character, and effect, but not with its present composition. No. 258, 'Bacchanalian Cup and Fruit,' is a brilliant arrangement of the productions of nature and art, by Mrs. MARGETTS: the grapes are extremely well painted. No. 227, 'Near Braemar, Aberdeenshire,' T. S. ROWBOTHAM, is a small drawing—forcible in its chiaro-scuro, and one of the class of subjects which the artist paints best. On the screens are frequently hung some of the best drawings in the exhibition, for it is very common to find an artist very powerful in sketches, but altogether incapable of attaining to anything like the same force in larger works. No. 285, 'The Challenge,' C. H. WEIGALL, is a poultry picture of much excellence: the birds are drawn with exquisite symmetry and high finish. No. 289, 'Fruit and Flowers,' by Mrs. HARRIS, is a composition of red and white roses, beautiful in colour and accurate in drawing. In the same department of Art is No. 296, by Mrs. MARGETTS, 'Lilac and Hedge-Sparrow's Nest'; the lilac is a very felicitous study. No. 310, 'On the Arno, near Florence,' T. L. ROWBOTHAM, is a subject higher up the river, rather near the distant mountains, than the city; but in the drawing, as in many by this painter, too much is made of the buildings; their inexorable squareness sorts but ill with the romantic features of the locale. No. 318, 'Boys Fishing,' by ROBERT CARRICK, is a composition; the scene a tract of mountainous scenery, with two boys angling for littlebats: it is a simple and forcible sketch. No. 319, 'Farewell! but whenever you welcome the hour,' by G. HOWSE, is one of those small sketches by this artist which we have highly commended in antecedent exhibitions. No. 320, 'Brook Farm,' by FANNY STEERS, is a sketch characterised by good effect and natural colour; and the following number, 321, by SARAH SETCHEL, entitled 'Sketch for a picture of an English Cottage Home,' has much of the force which we have seen in larger works by this lady: the subject is interesting, but not so sentimental as others she has exhibited, and perhaps the same qualities could not be realised in a larger picture. No. 322 is another small composition by G. HOWSE, from "Twelfth Night." In the place of a title, stands the well-quoted oburgation of Sir Toby Belch:—"Sir, ye lie: art thou any more than a steward? Dost thou think, because thou art virtuous, there shall be no more cakes and ale?" It is broad and spirited, and, as a large work, would be highly meritorious, could the same qualities be preserved in larger compositions. No. 331, 'A Boy at Prayer,' R. CARRICK, is a very effective sketch—earnest, and natural. No. 336 is an admirable drawing by L. HAGHE, catalogued as 'The Scrivener': it is such a picture as a devotee to the Dutch school

would paint: the author of the work must have intended to break a lance with some of the most eminent of the painters of what dealers call "conversation pieces." The scrivener is seated at his table, and his wife by his side, both curiously presented sitting square, and facing the spectator; the man of business wears his hat, and his wife is attired as becomes the help-mate of one at the head of a thriving concern. Both figures are unexceptionable, and the economy of the room, and the distribution of its furniture, are pointedly descriptive. No. 344, by AARON PENLEY, described as 'Serenity,' is a much larger work than is usually hung on a screen. It is a warm, sunny, mellow drawing, showing Windermere, the Langdale Pikes, Lingmoor Bow Fell, Crinkle Crankle, &c., in the distance. The foreground is occupied by a herd of kine that are come from their pastures for their evening draught. The sentiment of the title is sustained throughout the drawing. At the conclusion of our examination of the exhibition, we are confirmed in the opinion we expressed on our entering upon it—which is, that the works executed for reputation are not so numerous as they might be, and that those painted merely for the market are more abundant than they ought to be.

THE ROYAL SCOTTISH ACADEMY.

THE THIRTIETH EXHIBITION.

THE exhibition of the Scottish Academy is open for the second season in the new rooms, which, *quoad* interior, are elegant and effective, having more the appearance of a picture-gallery than the rooms of our Royal Academy, that have always appeared to us rather designed with a view to the dinners, than to any other festivities which the academy has to offer. Yet the Royal Scottish Academy is not the only mistake as an edifice for the exhibition of works of Art. We have viewed the two buildings (in Edinburgh) from every available point, in order to endeavour to understand wherefore they were built on the site they occupy. Greek architecture less than any other can afford to be looked down upon; these structures are overtopped by every house in Princes Street; and from any of the wynds which pierce the amphitheatre of the old town they appear really less significant than some of the buildings which have been erected for their dogs by certain of the Nimrods or Ramrods of our time. But turn we to the interior and its contents; there is something business-like and even commercial in the way in which the pictures are marked. The recurrence of the *affiche* "Sold to the Art-Union of Glasgow," leads a contemplative visitor to the conclusion that the said excellent institution is the only purchaser; because, if not so, why are not the names of the Smiths and Johnsons attached to the works which they have purchased? With respect to the pictures themselves, they are seven hundred and thirteen in number, with a proportion of water-colour works, and thirty-eight sculptural works, making a total of seven hundred and fifty-one. The portraits are very numerous, more so than in any exhibition we have ever seen; and of that class which represents figure-subjects examples also are abundant, though very few distinguished by original thought; yet, limited as the exhibition is, it shows a great diversity of manner and feeling, we may say freshness. It contains many productions with which we were before familiar; this, with certain other circumstances, suggests the idea that there is some difficulty in forming here an exhibition of what may be deemed eligible works of Art. In looking round these saloons we see much ambition in small things, but there is little sound didactic narrative; the Scottish school, it may be said, is young, but of its members there are men who have studied all the elder and younger schools of Europe, and the province of these is rather to correct than to pander to the vitiations of public taste. We have one observation to offer on the mottoes

and quotations that preface exhibition catalogues. The extract on the title-page of the catalogue of this exhibition is from "The Language and Literature of Italy," by, we believe, Count Carlo Pepoli, in which are cited the names of Dante, Michael Angelo, Alfieri, and Leonardo da Vinci; but, inasmuch as it is extremely difficult for a person, even well-read and learned in the works of those poets and painters, to discover any relation between the quotation and the works exhibited, it were better to select some quotation or maxim that would not disappoint the critical and enquiring visitor, for it is very clear that whatever Dante and Michael Angelo might have imagined—and the imaginations of both were rather excursive, they never contemplated anything in poetry or painting like English and Scottish rustic subject-matter. Such quotations on the title-pages of catalogues are grandiloquent and sounding, but they become only sorry prologues to domestic and rustic incident. But to the pictures:—we pass on to No. 74, 'The Death of Arthur, Duke of Bretagne,' R. S. LAUDER, R.S.A., from the 3rd Scene of the 4th Act of "King John,"—

"Bastard. Know you of this fair work?
Beyond the infinite and boundless reach
Of mercy, if thou didst this deed of death,
Art thou damned, Hubert," &c.

Before the two figures lies the body of Arthur, as it had fallen from the cliff; the Bastard stands sternly pointing to it, while the deprecatory action of Hubert expresses well the sentiment of the text. But an artist who sympathises so perfectly with the poet ought not to condescend to a vulgar effect,—that of bringing the head and figure of the Bastard, the darkest points, in opposition to the strongest lights. The damning scowl of the Bastard, and the apologetic embarassment of Hubert, are unobjectionable. The mail of the former is according to the period,—but wherefore does he rest upon a two-handed sword, a weapon which was not used generally until centuries after King John was forgotten? And wherefore the regal blazon on the surcoat worn by the Bastard? For neither of these incidents, we believe, can any authority be given, and anachronisms detract from the value of what is presumed to be historical painting. No. 191, entitled 'The Tempter,' W. DOUGLAS, R.S.A., is a subject in some degree allegorical. It contains two figures; that of a man seated at a table, and tempted, according to a superstition of the middle ages, to sign away in blood his hopes of salvation. The "Tempter," a shadowy fiend behind him, offers him the pen, and charms his ear with the music of the sound of gold. There is much elaborate painting in the work; it is everywhere carried out with infinite nicety, but perhaps there is too great a contrast between the two figures. No. 203, 'Wat Tinnin,' by JAMES DRUMMOND, R.S.A., is the story from the "Lay of the Last Minstrel,"—

"They crossed the Liddel at Curfew hour,
And burned his little lonely tower,
The fiends receive their souls therefore," &c.

The composition shows the flight of the borderer, accompanied by his wife; the whole forming an effective agroupment, though perhaps wanting breadth. A composition entitled 'Burns in Edinburgh,—1786,' painted by W. B. JOHNSTONE, R.S.A., and suggested by an "autobiographical fragment," in which it is stated by Scott that, when fifteen years of age, he saw Burns in the shop of Sibbald the bookseller, in Parliament Square. The poet is here represented as a man of very tall stature: he is accompanied by Adam Smith, Lord Monboddo, Dr. Hugh Blair, Henry Mackenzie, and others. The figures do not seem to be conscious of the presence of each other; but there are many estimable qualities in the work. CHARLES LEES, R.S.A., exhibits a very earnestly painted work, No. 327, 'The Martyrdom of George Wishart,' in which are introduced many of the most zealous of the persecutors of the reformers of that time. The purpose of the artist has been rather to bring forward many impersonations than give force and character to a few; there is also too much attention given to locality. MR. ARCHER's 'Last Supper' is a prominent feature

in the large room, but we have already spoken of it and others in this room. 'The Lollard,' E. W. DALLAS, No. 261, is an excellent subject, as showing the tyrannies of the Inquisition. A meek and studious old man, diligent in the search of truth, is served with the fatal summons by two men in masks, one of whom had been sufficient, invested with more of authority and personal dignity; there is, however, much credit due to the original thought. No. 91, 'The Dancing Lesson,' R. T. ROSS, A., is a cottage scene; a child listening to the screaming music of a tin whistle, blown by an elder brother. The work is full of good colour, and distinguished by appropriate expression. No. 223, by R. GAVIN, A., called 'The Weary Gleaners,' presents a couple of children returning from the harvest field. The figures are painted with breadth and taste, unexceptionable in colour and effect, but these qualities are enfeebled by the deficiency of equal quality in the foliage. No. 238 is a small but interesting work by JOHN FAED, R.S.A., 'The Household Gods in Danger,' the point of which is a child curiously examining some valuable china, which is painted with the nicest exactitude. No. 297 is a work by JAMES DRUMMOND, R.S.A., in which the elder architecture of Edinburgh divides the field with the figures. We have some remembrance of having seen the picture before; the title of the work is 'A Scene in Edinburgh,—the Morning after the Battle of Preston Pans.' We instance No. 300, 'Claudio and Isahel' (a good subject by the way), to observe the disproportion between the heads and figures of the impersonations; the picture has other errors, but it has not that of being scenic, a disqualification which most painters of dramatic subjects think it necessary to communicate to their works. No. 333, 'Harvest,' by ROBERT GAVIN, R.S.A., is a production supported by many valuable points, but the extreme care with which every grain of oats has been individualised gives the corn-sheaf the precedence of the sleeping figure. No. 342 is another meritorious work of that prolific artist JOHN FAED, R.S.A.; the objects and textures in the work are most successful. No. 376 is a picture of the same class, by the same painter; it is called 'Interior, with Fisherman Reading,' and is equally commendable with the preceding. No. 357, 'A Romp in the Hay Field,' is a small picture by P. F. POOLE, A.R.A., extremely sweet in colour, but presenting the principal figure, that of a girl, in a most ungracefully foreshortened pose. There are by the same painter three other open-air subjects, which we shall presently particularise, and of these we may say that they are much more agreeable than the large works which their author has of late years exhibited. No. 395 is a work by ERSKINE NICOL, A., which we find designated 'Whew! Caught Again!' The scene is a cottage interior, with a woman apparently rushing from the arms of a man, unfortunately plain, and too old to be either her lover or her husband; they have been surprised by an old woman, who stands at the door. The point of the story is by no means perspicuous,—if it be caricature it is a failure; there is a feeling for substance in the picture which might be improved into value in any intelligible subject-matter. 'The Minstrels,' No. 411, by W. CRAWFORD, are two life-sized heads, in the features of which there is agreeable character, but they are not young ladies who live by their minstrelsy. 'Sir Tristram teaching La Belle Isoude to Play the Harp,' by J. E. LAUDER, R.S.A., is a work we have already seen. 'History,' by SANT, we have also seen before. The three small pictures by POOLE, to which we have already alluded, are Nos. 426, 427, and 428, and entitled 'The Young Gleaner,' 'The Path over the Hills,' and 'Youth and Innocence,' they are miniature gems. No. 434, 'Caught,' by ALEXANDER CHRISTIE, A., is a production of little felicity of conception. The subject is a youth and maid, surprised by the father of the latter in a secluded walk, amid their mutual confessions; the pair look exceedingly silly under the rebuke of the young lady's father. Although there is no finish in the work, there is some expression. No. 243, 'An Irish Merry-making,' ERSKINE NICOL, shows, like

a work by the same painter already noticed, a valuable apprehension of the use of lights and darks in composition; the artist has also caught much of the instinct of Irish character, but there is the same tendency to caricature that we have observed in a picture already noticed. No. 253, 'The Stolen Ride,' is a horse composition, by JOHN GLASS, A., in which the animals are well drawn. By J. BALLANTYNE, A., is exhibited No. 270, 'The Return of the Sword,' an officer returned from the Crimea brings back to the widow of his friend the sword of her late husband, slain in battle. The narrative is clear enough, but the subject, and the manner of detailing it, are commonplace. The manner of No. 108, 'The Bible,' by R. T. ROSS, is hard, but the general effect and colour are unobjectionable. In 'Lucy Gray,' by JOHN A. HOUSTON, R.S.A., there is a striking instance of the immobility of the model, and the inactivity of the painter. A poor child is represented as in a snowstorm, and we find her, as it were, standing still, instead, as any intelligent being would, of hastening onward; there is much care, but a want of natural truth in the picture. 'The Raid of Ruthven' is another picture by JOHN FAED, R.S.A., the subject of which is an outrage offered to James II. by the Master of Glamis; the figures are admirably painted, and careful in costume; but the scene of the incident is much too modern in its fittings and carpentry; the group in the recess is admirable: were the picture ours we should cut out James and the Master of Glamis and retain the secondary group. No. 141, 'Scuffle in a Guard Room,' by MEISSONIER, is a production of great merit, the property of H. R. H. Prince Albert, of which we have already spoken. 'Imagine at the Cave,' No. 147, by R. S. LAUDER, is a remarkable picture, as in it the cave and not Imagine is the picture; it is rather a geological essay than a work of Art. No. 164, 'Watching the Pass—Daybreak,' by J. NOEL PATON, R.S.A., is a production of a high order of merit—there is only one figure, that of a musketeer of the seventeenth century seated at daybreak near a wild and mountainous gorge with a bloodhound for his companion; every passage of the work is endowed with eloquent description. Upon No. 25, 'The Rosicrucians,' a great amount of labour has been bestowed, but perhaps not with all the success that could be desired. The picture is by W. DOUGLAS, R.S.A., who must be complimented on the industry evidenced in every passage of the picture. The figures are too small for so large a canvas; the Rosicrucians were mystic adventurers who seldom were fortunate enough to have a saloon so well furnished to pursue their researches in. The curtain before which they are standing is too rigid, indeed it is a mistake to paint figures so small *à propos* of such a subject on a canvas so large. In many of the landscapes we find a degree of force and originality which we shall instance as these qualities occur in the works which we notice: one of the first of this class that struck us was No. 59, 'Storm on a Highland Coast,' by HORATIO MACCULLOCH, R.S.A., a large picture, the subject being a passage of wild scenery under the effect of a storm in which the drifting of the rain is most forcibly described. No. 63, 'A Woodland Sketch, near Comrie,' by ARTHUR PERIGAL, exemplifies very careful drawing in the boles and branches of the trees, but the definition and separation of the foliage masses, the most difficult thing to accomplish in tree-painting, is not so successful. The fragment of rock in No. 69, by EDWARD HARGITT, called 'In Arran—Ayrshire Coast in the distance,' is among the most perfect passages of this department of Art we have ever seen; it is natural and unmannered, exhibiting the essence of nature rather than the pride of the brush; but this is not the only commendable portion of the work, it is sparkling and attractive throughout. There is in No. 78, 'On the Welvin,' by J. MILNE DONALD, a most perfect imitation of the depth and lustrous reflection of water, which has been most patiently imitated from nature, with the forms of near objects subdued to the tone of natural reflection, the glassy surface of the water never being forgotten. Any particularly successful part of a picture such as this

places nature so palpably before the spectator that, unless the other parts of the work are equally sustained by eminent quality, we can never see in them anything beyond the paint and the brush. As an instance of what is meant by the foregoing remark, in No. 92, 'English Road Scene,' ALEX. FRASER, we feel the paint too sensibly, the manipulation is hard although portions are creditably executed. No. 188, by the same artist, 'On the Avon, Warwickshire,' is more agreeable; the materials of the composition are a cottage, trees, barges, boats, &c. No. 195, 'Cattle on the banks of a River,' the cattle by T. SIDNEY COOPER, R.A., and the landscape by F. R. LEE, R.A., is a work of which we have already spoken, but the re-exhibition of old pictures is much to be regretted in a collection like this, save in cases of works of paramount excellence. It is difficult to understand why a work should be again brought before the public with so little to recommend it. No. 207, 'Highland Deer Forest—Isle of Skye,' by HORATIO MACCULLOCH, embodies the essential features of that kind of landscape which it professes to show; it is a highly picturesque passage of nature, with an appearance so rude as to seem yet unprepared as an abiding place for man; the picture is better in effect than colour. In No. 220, 'A fresh Breeze off the coast of Holland,' by E. T. CRANFORD, R.S.A., the water is too grey to be so near the Dutch shore; the picture shows a strong leaning to the Dutch school of marine painting. No. 233, 'A Village on the Moors,' by HENRY BRIGHT, strongly exemplifies that very masterly handling which prevails throughout all the pictures of this artist. This is the only work we have seen by him on the walls of an exhibition for years; it is perhaps too foxy in colour, with a predominance of that kind of inexorable conventionalism which must arise from very rapid painting, without enough of the counsel of nature. No. 296, 'A Study of Beeches, near Lawers, Perthshire,' A. PERIGAL, A. These trees have been very closely studied from the reality, the composition throughout is most carefully wrought. No. 311, 'Lney Ashton—finished sketch,' ROBERT GAVIN, A., is a very charming study—simply as a study—but it had been better to have given it no name than to have called it 'Lucy Ashton,' the impersonation being altogether too childish; it might with equal propriety be called either the 'Maid of Orleans' or the 'Witch of Endor.' No. 312, 'Moonlight Effect—Herring-boats going out,' GEORGE SIMON, R.S.A., as an effect is very successful, and reminds the spectator of a favourite theme of the Dutch painters. No. 308, 'An old Shute,' by JOHN C. WINTOUR, a study throughout very satisfactory. No. 319, 'The Clansman's Curse,' JOHN C. BROWN, A.R.S.A., is a production of much merit, as also are—No. 365, 'An Old English Farmstead,' ALEX. FRASER; No. 370, 'An English Village Winter Afternoon,' SAM. BOUGH; No. 378, 'The Linn Sport, Dalry, Ayrshire,' J. H. CRANSTOWN; No. 450, 'A Woodland Burn,' JOHN C. WINTOUR, and by the same painter 'The Miller's Cottage,' No. 32, 'Outposts,' JAMES DRUMMOND, R.S.A., a work of much depth and careful finish. We cannot, however, omit to notice the works of MR. WALLER H. PATON: they are landscapes of the very highest order of merit; and place the name of the excellent artist not only foremost among the painters of his own school, but among those of the world, in the beautiful art of which he is a professor. They combine vigour with delicacy; and are remarkable for truths poetically rendered,—the offspring of a powerful yet refined intelligence. There are many portraits of a high degree of excellence—but some of the best of these we have already noticed elsewhere—there are also some masterly water-colour drawings which we have not space to particularise. The sculptural productions amount in number to thirty-eight, among which there are works by W. CALDER MARSHALL, R.A., the late Patrie Park, W. BRODIE, and other artists of reputation. As a whole, the exhibition contains many works of admirable quality, but not many strikingly ambitious. The rooms are imposing in effect, but that which is most objectionable is the re-exhibition of known pictures; it bespeaks weakness in the Scottish Academy.

THE ART-UNION OF LONDON.

THE annual meeting of the subscribers to this institution met at the Haymarket Theatre on the 29th of April, to receive the report of the committee, and to witness the drawing of the prizes; Lord Montagu, the President of the Society, took the chair. Mr. George Godwin, F.R.S., one of the honorary secretaries, to whose indefatigable exertions the Art-Union of London has so long been indebted, read the report, which stated that the total subscriptions for the past year amounted to 13,960*l.* 10*s.*, which sum has been thus expended:—Pictures and other prizes, 6,031*l.*; cost of engraving, 4,694*l.* 7*s.* 5*d.*; printing and other expenses, with a reserve of 2½ per cent. required by charter, 3,235*l.* 8*s.* 7*d.*; total, 13,960*l.* 16*s.* The sum set apart for prizes, to be selected by the prizeholders themselves, was allotted—27 works at 10*l.* each; 30 works at 15*l.* each; 24 works at 20*l.* each; 30 works at 25*l.* each; 20 works at 35*l.* each; 16 works at 50*l.* each; 10 works at 60*l.* each; 4 works at 75*l.* each; 3 works at 100*l.* each; 1 work at 150*l.*; 1 work at 200*l.* To these were added—11 bronzes of "Her Majesty on Horseback;" 5 bronzes in relief of "The Duke of Wellington entering Madrid;" 30 vases in iron; 20 porcelain statuettes, "The Stepping-Stones;" 50 porcelain statuettes, "The Dancing Girl reposing;" 34 porcelain busts of Clytie; 40 silver Medals of Flaxman; and 30 silver Medals of the late Sir J. Vanbrugh; 500 impressions of the lithograph, "The Supper Scene;" and 250 of the mezzotint of "Tyndale translating the Bible;" making in all 1130 prizes.

The engravings in preparation for the subscribers of the year 1856-7 are "The Piper," engraved by E. Goodall from the picture by his son, F. Goodall, A.R.A.; and "The Clemency of Cœnr de Lion," engraved by H. C. Shenton, from the picture by Cross. For a future year a series of wood engravings, from the best works of deceased British artists, under the superintendence of Mr. W. J. Linton, is in the course of production, and promises to form a work of much beauty. The council have concluded an arrangement with the members of the Etching Club, including Messrs. Redgrave, Creswick, Horsley, Cope, Taylor, &c., for a volume of etchings, to be appropriated hereafter; and they have further to announce, that some very important works have been put into the hands of engravers for ensuing years. Mr. Ward's engraving, "Tyndale translating the Bible," after Mr. A. Johnstone, is completed.

The prizeholders of last year purchased from the various exhibitions of the season 187 works of Art, to the following amounts, irrespective of the sums added by the prizeholders themselves:—From the Royal Academy, 1,975*l.*; the National Institution of Fine Arts, 1,771*l.* 10*s.*; Society of British Artists, 1,340*l.*; British Institution, 430*l.*; Water-Colour Society, 415*l.*; and New Water-Colour Society, 388*l.* 10*s.*

The retiring members of council are the Rev. Mr. Coleridge, Mr. Macdonald, Sir Wm. Herries, and Mr. Sydney Smirke; and in their place Mr. W. G. Tannton, Mr. Fras. Bennoch, Mr. J. R. Soden, and Mr. Herbert Minton, have been elected.

The reserved fund now amounts to the sum of 6,958*l.*

The 200*l.* prize fell to the lot of Mr. James Scott, Wath, near Rotherham; that of 150*l.* to Mr. R. Keetly, of Grimsby; and the three of 100*l.* respectively to Mr. J. Bradshaw, Jun., of Leeds; Mr. J. Bontoft, Boston; and Mr. R. Robinson, St. Helen's, Liverpool. We may also observe that, as a remarkable instance of good fortune, five prizes fell to the share of Mrs. H. Graves, of Pall Mall—one of 25*l.*, a bronze statuette of her Majesty on horseback, and a medal of Flaxman; and her son, we believe, gained another, a bronze of the Duke of Wellington's entry into Madrid.

Considering how the events of the past year have affected all matters of luxuries, the Art-Union of London, as the above statement must show, seems not to have lost its hold on public favour. We hope with returning peace to find its next list of subscribers abundantly enlarged.

BRITISH ARTISTS: THEIR STYLE AND CHARACTER.

WITH ENGRAVED ILLUSTRATIONS.

No. XV.—BENJAMIN ROBERT HAYDON.

ABOUT the end of the month of June, 1846, the daily papers reported the melancholy intelligence that one long known to the public in connexion with Art had, in an hour of temporary insanity, committed self-destruction. The announcement was received by his personal friends with far more sorrow than surprise; and "Poor Haydon!" was the exclamation which escaped, not only from their lips, but from the lips of all to whom his genius and his conduct through life had made his name perfectly familiar. His is a sad history; yet on that very account is it fruitful of instruction to every man of great intellectual powers striving after fame, and who fails to reach it—unless of that kind which becomes mere notoriety—not on account of his unworthiness, but because he seeks it by a crooked and devious path, which the world will not recognise as the true one. Genius can never extort the "bubble reputation" from minds unable to appreciate talent, or unwilling to recognise it because unsuited to their tastes, or rendered unpalatable by the very attempts to force it into notice. There is, perhaps, scarcely a darker page presented in the whole annals of Art than that afforded by the history of this great painter—for such he undoubtedly was—from its commencement to its unhappy close, and his own pen has written it in the biography he left behind him. A life so full of sad and strange incident, of turmoil and conflict, of labour and disappointment, would necessarily furnish ample materials for a lengthened

notice: our space forbids this; and, moreover, the subject is of so painful a nature that we feel no desire to say more than is just sufficient for the purpose we have in view.

Benjamin Robert Haydon was born at Plymouth in 1786; he displayed at an early age a taste for the Art to which he subsequently attached himself with so much devoted but ill-directed enthusiasm. His father, a bookseller in the town, cared little to encourage the inclination of his son, but at length yielded to his wishes, and sent him in 1804 to London, not, however, without the hope of soon seeing him return to the family roof. In this he was to be disappointed; nor was it very probable that a young man who possessed the spirit which the following passage from Haydon's autobiography expresses, would be easily turned aside from his path:—"The Sunday after my arrival," he says, "I went to the new church in the Strand, and in humbleness begged for the protection of the Great Spirit to guide, assist, and bless my endeavours; to open my mind, and enlighten my understanding. I prayed for health of body and mind; and on my rising from my knees felt a breathing assurance of spiritual aid which nothing can describe. I was calm, cool, illuminated, as if crystal circulated through my veins. I returned home, and spent the day in mute seclusion."

Very shortly after his arrival in the metropolis he entered the schools of the Royal Academy—this was in 1804: Fuseli, to whom he had received an introduction, took great interest in him. In 1807, he exhibited his first picture, "The Repose in Egypt," which was purchased by Mr. Hope, known as *Anastatius Hope*. In 1809, he exhibited his picture of "DENTATUS," which forms one of our engravings: through the intervention of Fuseli it was well placed in the rooms of the Royal Academy; but in consequence of the "hanging committee" removing it from the great room, where it had been first hung, to another, though the work was equally well seen, Haydon bitterly complained of the injustice done to him. This was the event that cast its shadow over all his after life, and involved him in an endless contest with the Academy, whom he openly accused of fearing his success as the founder of a new school of Historical Art. The "Dentatus," which was exhibited the following winter at the British Institution, where it gained the first prize of one hundred guineas, is a bold and vigorous composition, which would be honourable to any artist, whatever his standing; Haydon, when he painted it, had not reached his twenty-third year.

Engraved by]

RAISING OF LAZARUS.

[J. and C. P. Nicholls.

From the outset of his career Haydon had his own ideas of the grand style of Historical Art, and he persevered in maintaining them whatever his patrons thought or desired to the contrary: is it a wonder, therefore, that he was comparatively neglected, or, at least, that he failed to satisfy many who would have befriended him? Sir George Beaumont, for example, gave him a commission to paint a subject from "Macbeth" of a certain size, as he required it to occupy

a particular place in a room; Haydon produced a picture three times as large as the limits assigned him, and then was angry with his patron for expressing dissatisfaction with what he had done.

The painting of this picture, his quarrels with the Academy, and his literary disputations—his pen ever did himself more injury than his pencil benefited him—it seemed a pity he had ever been taught to write—appear to have occupied

Haydon till the spring of 1812, when he commenced his "Judgment of Solomon;" it was finished in the spring of 1814, and exhibited in the gallery of the Water-Colour Society, then in Spring Gardens. "The success of 'Solomon,'" he says in his diary, "was so great, and my triumph so complete, that had I died then my name must have stood on record as a youth who had made a stand against the prejudices of a country, the oppressions of rank, and the cruelty and injustice of two public bodies." It was purchased by two Devonshire gentlemen, Sir W. Elford and Mr. Tingecombe, for six hundred guineas, though what became of it for many years, till it was purchased by its present possessor, Sir E. Landseer, we know not; but when, in 1827, a public subscription was made to relieve the painter from his pecuniary difficulties, he gave the following

account of the disposition of his great pictures:—"My 'Judgment of Solomon' is rolled up in a warehouse in the Borough; my 'Entry into Jerusalem,' once graced by the enthusiasm of the rank and beauty of the three kingdoms, is doubled up in a back room in Holborn; my 'Lazarus' is in an upholsterer's shop in Mount Street; and my 'Crucifixion' in a hayloft at Lisson Grove." Thus, it must be acknowledged, is a melancholy statement for a painter of genius to be compelled to make, and is anything but creditable to the country that allowed such neglect.

In the month of May, 1814, Haydon, accompanied by Wilkie, set out for Paris, at that time occupied by the allied armies of England, Russia, &c. Previous to starting, however, Haydon sketched in his "Christ's Entry into Jerusalem;" it was not completed till 1820; was then exhibited at the Egyptian Hall, Piccadilly, where it attracted such attention as to realise to the artist the sum of £1300. He then took it to Edinburgh and Glasgow; the proceeds of the exhibition at these two places realised about £900 more, exclusive of his expenses, so that it may fairly be stated the artist received little less than £2000 for the exhibition of this single picture—by no means a small sum even for its purchase; though if it be considered that it took him nearly six years to complete, the annual income derived from it would be most inadequate for a painter of Haydon's talents and requirements.

His next work was the "Agony in the Garden," painted for Sir George Phillips, a liberal patron of Haydon, who had advanced him the price of it—five hundred guineas—to complete the "Solomon." "I exhibited it," writes the artist, "with my other works. I took a great deal of money at this exhibition, but not enough; and it was wrong so to strain public enthusiasm. This particular picture was severely handled. Sir George was disappointed

(though he was as much to blame as myself); and when the picture was sent home, he so objected to a sacred subject in a drawing-room, that he put it out of view altogether. It was wrong in me to paint it so large; it was wrong to choose such a subject to be hung where quadrilles were danced. It was wrong in every way." This picture was a short time since, and we believe is now, in the hands of Mr. Barrett, the picture-dealer, in the Strand.

But though Haydon could see his errors, he took no pains to amend them; obstinate and self-willed, he disregarded public opinion, vexed his patrons, and then foolishly complained of the injustice he had received. "I have been eight years," he says, "without a commission from the nobility; and of the thirty-nine years I have been an historical painter, thirty-two without an order of

any kind." And yet, notwithstanding his disappointments, he continued to paint pictures which, from their vast dimensions, no private individuals could hang up; and we have not yet learned to decorate our churches with such works of art. In 1820, he began his "LAZARUS." We get an insight into the disposition of the painter from what he has left upon record, and therefore offer no apologies for our extracts. "I always filled my painting-room to its full extent; and had I possessed a room 400 feet long, 200 feet high, and 400 feet wide, I would have ordered a canvas 199-6 long by 199-6 high, &c. My room was thirty feet long, twenty wide, fifteen high. So I ordered a canvas nineteen long by fifteen high, and dashed in my conception, the Christ being nine feet high. This was a subject and a size which I loved to my very marrow." Can such an act be called by any other name than a mental delusion?

But we have no space for comment, and can only briefly refer to the other pictures of this highly-gifted but infatuated painter. In 1827, he was incarcerated in the King's Bench Prison for debt. Here he painted the "Mock Election" held there, for which George IV. paid him five hundred guineas; and the

"Chairing the Member," bought by Mr. Francis, of Exeter, for three hundred guineas. Another work, painted about the same period, "Pharaoh Dismissing Moses," was purchased by a Mr. Hunter for five hundred guineas. His subsequent works were—the "Reform Banquet;" the meeting of the "Anti-slavery Society;" the "Banishment of Aristides;" "Nero playing on the Lyre while Rome is burning;" "CURTIUS;" and "Alexander the Great encountering a Lion." At the time of his death he was employed on another large work—"Alfred the Great and the First English Jury;" but mind and body were worn out—he succumbed before disappointed hopes and enfeebled physical powers.

The contemporaries of Haydon, both artists and art-critics, are scarcely in a

[J. and G. P. Nicholls.

position to offer an unbiassed opinion on his pictures; party-feeling or prejudice has been too busily at work to allow us to exercise a calm judgment in estimating them. In his "Lectures on Art"—a work full of sound and valuable instruction—he says, "From the oppression of the authorities in Art, *without any cause* (?), and my subsequent resistance and opposition to them, I had brought on myself the enmity of all those who hoped to advance in life by their patron-

age; loss of employment from their continual calumny brought loss of income; the rich advanced loans to finish great works they were persuaded not to purchase," &c. This, there is little question, was but too true; we stop not to inquire how much his own conduct contributed to such a result; but it may safely be averred that in no country but our own would a painter of his genius, whatever his mental temperament may have been, have met with treatment similar to

DENTATUS.

[J. and G. F. Nicholls.]

that experienced by Haydon during a large portion of his career. Can that be called a groundless charge of neglect which he brought against the public, when 12,000 people flocked to see General Tom Thumb in one week, and only 133 visited the pictures of "Aristides" and the "Burning of Rome," exhibited under the same roof at the same time? Was there not enough in this to excite the anger of a far less sensitive and excitable mind than Haydon's? and was it not sufficient

to urge him to the commission of the awful deed which deprived his country a month or two afterwards of a great and original painter? Peace to his memory his excellence, no less than his failings, will hereafter receive its due reward.

Haydon, in his earlier time, had numerous pupils, several of whom have risen to eminence, though in a far different style from his own: among them were—Sir C. L. Eastlake, the Landseers, Lance, Prentice, and Harvey.

THE PROGRESS OF ART-MANUFACTURES.

GEM-ENAMELLED VASES BY MESSRS. JENNENS & BETTRIDGE.

We have on several occasions directed the attention of our readers to the manufactures in papier maché of Messrs. Jennens and Bettridge, of London and Birmingham; on this page are introduced engravings from works by the same firm of a totally different nature, but not the less

worthy of notice as beautiful objects of Art-manufacture: these are glass vases, produced by a patented process of gem-enamelling. The largest engraving is from one of a pair executed for Prince Albert, from designs by Mr. Lewis Gruner: they stand about seventeen inches in

height. The groundwork is of a rich deep purple colour. The surface of each vase is divided by floral festoons of gold and diamonds into four equal compartments, one of which is occupied by laurel wreaths of emeralds, with ruby scrolls, surrounding the initials "V" and "A" on a

maroon ground in topaz and gold. In the centre of each of the remaining divisions are the rose, shamrock, and thistle, in their natural colours: the mottoes, "*Dieu et mon droit*" and "*Treu und Fest*," in gold and diamonds, encircle the upper part of the vase, and above this are scrolls of

diamonds, enriched with wreaths of flowers in jewels of appropriate colours. The lower part is set in pierced mountings of electro-gilt metal, by Messrs. Elkington and

Mason, of Birmingham: between these mountings are devices of gold and jewels. The others it is unnecessary

to describe, as our object is principally to show the character of a novel and very beautiful branch of Art-manufactures, which will doubtless be much "inquired after."

THE MINSTRELS OF THE MIDDLE AGES.

BY THE REV. EDWARD L. CUTTS, B.A.*

2 B. vii., the scene of the dance is not indicated; the minstrels themselves appear to be joining in the saltation which they inspire. In the next illustration, reproduced from Mr. Wright's

"Domestic Manners of the English," † we have a chamber; it is from M. Barrois's MS. of the curious picture of a dance, probably in the great "Compte D'Artois," of fifteenth century date.

In these instances the minstrels are on the floor with the dancers, but in the latter part of the middle ages they were probably—especially on festal occasions—placed in the music gallery the screens, or entrance-passage of the hall.

Very probably the services of the minstrels of a gentleman's household were also required to assist at the celebration of divine worship. Allusions occur perpetually in the old romances, showing that it was the universal custom to hear mass before dinner, and even song before supper, e. g.: "And so they went home and unarmed them, and so to even-song and supper. * * * And on the morrow they heard mass, and after went to dinner, and to their counsel, and made many arguments what were best to do." ‡ Generally, it is probable, the service was performed by the chaplain in the private chapel of the hall or eastle, and it seems probable that the Lord's minstrels assisted in the musical part

VERY nobleman and gentleman of estate had one or more minstrels as a part of his regular household, and we have shown that their duties were to introduce the courses at dinner, in their lord's hall; to play during the progress of dinner; and to precede the gallant and fair company into the great chamber, there to make music to their dancing.

But the dance was not always in the great chamber. Very commonly it took place in the hall. The tables were only moveable boards laid upon trestles, and at the signal from the master of the house, "A hall! a hall!" they were quickly put aside; while the minstrels tuned their instruments anew, and the merry folly at once commenced. In the illustration, of early fourteenth century date, which we here give from folio 174 of the Royal MS.,

Your quere nor organ song shal want
With countre note and dyscant;
The other half on organs playing,
With young children ful fayn synging."

And in inventories of church furniture in the middle ages we find organs enumerated.* But not only the organ, but all instruments in common use, were probably also used in the celebration of divine worship. The men of those days were in some respects much more real and practical, less sentimental and transcendental than we in religious matters: we must have everything relating to divine worship of different form and fashion from ordinary domestic appliances, and think it irrelevant to use things of ordinary domestic fashion for religious uses, or to have domestic things in the shapes of what we call religious art. They had only one art, the best they knew, for all purposes; and they were content to apply the best of that to the service of God. Thus to their minds it would not appear at all unseemly that the minstrels who had just enlivened with their strains their master's afternoon meal, should walk straight from the hall to the chapel, and attune more solemn strains of the self-same instruments to the divine praise. Moreover, they who deduced religious ceremonial from that of the Temple worship would not forget the cymbals, psalteries, and harps of the Levitical service. The only direct proof we can produce is that already mentioned, that the chapel royal establishment of Edward IV. consisted of trumpets, shalms, and pipes as well as voices; and we may be quite sure that the custom of the Royal chapel was imitated by noblemen and gentlemen of estate. It is remarkable that although representations of church interiors frequently occur among the illuminations of MSS., we have not been able to meet with one in which musicians, either playing organs or any other instrument, are introduced. Perhaps they were placed in the rood-loft which occupied the same relative position in the choir which the music gallery did in the hall. But we do derive from the MS. illuminations abundant proof that the ordinary musical instruments were not considered improper to be introduced into divine worship, for we meet with repeated instances in which David singing the psalms is accompanied by a band of musicians, as in the instance which forms the initial letter of this paper, which is taken from a psalter of early thirteenth century date in the British Museum (Harl. 5102). In the MSS. we not unfrequently find the ordinary musical instruments placed in the hands of the angels; e. g. in the early fourteenth century MS. Royal 2 B vii., in a representation of the creation with the morning stars singing together, and all the sons of God shouting for joy, an angelic choir are making melody on the trumpet, fiddle, cittern, shalm and harp. There is another choir of angels at p. 168 of the same MS., two citterns and two shalms, a fiddle and trumpet. Similar representations occur very significantly in the choirs of churches. In the bosses of the ceiling of Tewkesbury Abbey Church we find angels playing the cittern (with a plectrum), the harp (with its cover seen enveloping the lower half of the instrument) and the cymbals. In the choir of Lincoln Cathedral,

of the service. The organ doubtless continued to be, as we have seen it in Saxon times, the

most usual church instrument. Thus the King of Hungary in "The Squire of Low Degree," tells his daughter:

"Then shal ye go to your even song,
With tenours and trebles among;

* Edward VI.'s commissioners return a pair of organs in the church of St. Peter Mancroft, Norwich, which they value at 40s., and in the church of St. Peter, Parmentergate, in the same city, a pair of organs which they value at 10l. (which would be equal to about 70l. or 80l. in these days), and soon after we find that 18s. were "paid to a carpenter for making of a planche (a platform of planks) to sette the organs on."

* Continued from page 13.

† *Art-Journal*, vol. vi., p. 19.

‡ Mallory's "History of Prince Arthur," vol. i. p. 44.

some of the noble series of angels* which fill the spandrels of its arcades, and which have given to it the name of the angel choir, are playing instruments, viz., the trumpet, double pipe, pipe and tabret, dulcimer, viol and harp, as if to represent the heavenly choir attuning their praises in harmony with the human choir below:—"therefore with angels and archangels, and with all the company of heaven, we laud and magnify thy glorious name." We cannot resist the temptation to introduce here another charming little drawing of an angelic minstrel, playing a shalm, from the Royal MS. 14 E iii.; others occur at folio 1 of the same MS. The band of village musicians with flute, violin, clarinet, and bass-viol, whom most of us have seen occupying the singing-gallery of some country church, are probably not inaccurate representatives of the band of minstrels who occupied the rood-lofts in medieval times.

Again, in those more private passages of arms, between a country knight and his neighbour,

who wished to keep their spears in practice against the next tournament; or between a couple of errant knights, who happened to meet at a manor-house; the lists were roundly staked out in the base-court of the castle, or in the meadow under the castle-walls; and, while the ladies looked on and waved their scarfs from the windows or the battlements, and the vassals flocked round the ropes, the minstrels gave animation to the scene. In the accompanying illustration from the title-page of the Royal MS. 14 E iii., a fine volume of romances of early fourteenth century date, we are made spectators of the principal actors in a scene of the kind; the herald is arranging the preliminaries between the two knights who are about to joust, while a band of minstrels inspire them with their strains.

In actual war only the trumpet and horn and tabor seem to have been used. In "The Romance of Merlin" we read of

"Trumpets beting, tambours clashing,"

in the midst of a battle; and, again on another occasion—

"The trumping and the tabouring,
Did together the knights fling."

There are several instances in the Royal MS., 2 B. vii., in which trumpeters are sounding their instruments in the rear of a company of charging chevaliers.

The earliest instance which we meet with of the modern-shaped drum is in the Coronation-Book of Richard II., preserved in the Chapter-

house, Westminster. It may be necessary to assure those who are not accustomed to the rude medieval perspective, that the instrument in the accompanying illustration is really intended for a small drum of the ordinary modern shape.

Not only at these stated periods, but at all times, the minstrels were liable to be called upon to enliven the tedium of their lord or lady with music and song; the King of Hungary (in "The Squire of Low Degree"), trying to comfort his daughter for the loss of her lowly lover, by the promise of all kinds of pleasures, says that in the morning,

"Ye shall have harpe, santry, and songe,
And other myrthes you among."

And again a little further on, after dinner,

"When you come home your menie amongo,
Ye shall have revell, daunces, and songe;
Lytle children, great and smaile,
Shall syng as doth the nightingale."

And yet again, when she is gone to bed,

"And yf ye no rest can take,
All night mynstrels for you shall wake."

Doubtless many of the long winter evenings, when the whole household was assembled round the blazing wood fire in the middle of the hall, would be passed in listening to those interminable tales of chivalry which my lord's chief harper would chant to his harp, while his fellows

would play a symphony between the "fyttes." Of other occasions on which the minstrels would have appropriate services to render, an entry in the Household Book of the Percy family in A.D. 1512, gives us an indication: There were three of them at their castle in the north, a tabret, a lute, and a rebec; and we find that they had a new-year's gift, "xxs. for playing at my lordes chamber doure on new years day in the mornynge; and for playing at my lordes sone and heire's chamber doure, the lord Percy, iis.; and for playing at the chamber dours of my lord's younger sonnes, my yonge masters, after viii. the piece for every of them."

Clerical censors of manners during the middle ages frequently denounce the dissoluteness of minstrels, and the minstrels take their revenge by lampooning the vices of the clergy: like all sweeping censures of whole classes of men, the accusations on both sides must be received cautiously. However, it is certain that the minstrels were patronised by the clergy. We shall presently find a record of the minstrels of the Bishop of Winchester in the fourteenth century; and the ordinance of Edward II. tells us that minstrels flocked to the houses of prelates as well as of nobles and gentlemen. In the thirteenth century, that fine sample of an English Bishop, Grosstete of Lincoln, was a great patron of minstrel science: he himself composed an allegorical romance, the Casteau d'Amour. Robert de Brunne in his English paraphrase of Grosstete's Manuel de Peches (begun in 1303), gives us a charming anecdote of the Bishop's love of minstrelsy.

"Y shal yow telle as y have herde,
Of the bysshope seynt Roberte,

* There are casts of those in the Medieval Court of the Crystal Palace.

Hys to-name ys Grostet,
Of Lynkolne, so seyth the gest.
He loved moche to here the harpe.
For manny witte hyt makyth sharpe.
Next hys chaumber, besyde hys study,
Hys harpers chaumbre was fast therby.
Many tymes be nyght and dayys,
He had solace of notes and layys.
One askede hym onys resun why
He hadde delyte in mynstraly?
He answered hym on thys manere
Why he helde the harper so dere.
The vertu of the harpe, thughe skylle
and ryght,
Wyl destroye the fendes myght;
And to the croys by gode skylle
Ys the harpe lykened weyle.
Tharfor gode men, ye shul lere
Whan ye any gleman here,
To wnschep Gode al youre powere,
As Dauid seyth yn the sautere."

Minstrels appear to have been retained in monasteries also.* We know that the abbots lived in many respects as other great people did; they exercised hospitality to guests of gentle birth in their own hall; treated them to the diversions of hunting and hawking over their manors, and in their forests; and did not scruple themselves to partake in those amusements; and it is not unlikely that they should also have minstrels wherewith to solace their guests and themselves. It is quite certain at least that the wandering minstrels were welcome guests at the religious houses; and Warton records many instances of the rewards given to them on those occasions. We may record two or three examples.

The monasteries had great annual festivals, on the ecclesiastical feasts, and often also in commemoration of some saint or founder; there was a grand service in church, and a grand

dinner afterwards in the refectory. The convent of St. Swithun, in Winchester, used thus to keep the anniversary of Alwyne the Bishop; and in the year 1374 we find that six minstrels, accompanied by four harpers, performed their minstrelsies at dinner, in the hall of the convent; and during supper sang the same gest in the great arched chamber of the prior, on which occasion the chamber was adorned, according to custom on great occasions, with the prior's great dorsal (a hanging for the wall behind the table), having on it a picture of the three kings of Cologne. These minstrels and harpers belonged partly to the Royal household in Winchester Castle, partly to the Bishop of Winchester. Similarly at the priory of Becester, in Oxfordshire, in the year 1432, the treasurer of the monastery gave four shillings to six minstrels from Buckingham, for singing, in the refectory on the Feast of the Epiphany, a legend of the Seven Sleepers. In 1430 the brethren of the Holie Crosse at Abingdon celebrated their annual feast; twelve priests were hired for the occasion to help to sing the dirge with becoming solemnity, for which they received four pence each; and twelve minstrels, some of whom came from the neighbouring town of Maidenhead, were rewarded with two shillings and four pence each, besides their share of the feast and food for their horses. At Mantoke Priory, near Coventry, there was a yearly obit, and in the year 1441, we find that eight priests were hired from Coventry to assist in the service, and the six minstrels of their neighbour, Lord Clintou, of Mantoke Castle, were engaged to sing harp and play in the hall of the monastery at the grand refection allowed to the monks on the occasion of that anniversary. The minstrels amused the monks and their guests during dinner, and then dined themselves in the

* In the reign of King Henry II., Jeffrey, a harper, received an annuity from Hild Abbey, near Winchester.

paintured chamber (*camera pieta*) of the monastery with the sub-prior, on which occasion the chamberlain furnished eight massy tapors of wax to light their table.

These are instances of minstrels formally invited to take part in certain great festivities; but there are proofs that the wandering minstrel, who, like all other classes of society would find hospitality in the guest-house of the monastery, was also welcomed for his minstrel skill, and rewarded for it with guerdon of money besides his food and lodging. Warton gives instances of entries in monastic accounts for disbursements on such occasions; and there is an anecdote quoted by Percy, of some dissolute monks who one evening admitted two poor priests whom they took to be minstrels, and ill-treated and turned them out again when they were disappointed of their anticipated gratification.

Here is a curious illumination from the Royal MS. 2 B vii., representing a monk and a nun themselves making minstrelsy.

The corporations of corporate towns probably also from early times had their band of minstrels, of whom the town waits are the modern representatives. The rules of the Beverly Guild of Minstrels order that "no new brother shall be admitted except he be mynstrell to some man of honour or worship, or waite of some town corporate or other ancient town, or else," &c.

But besides the official minstrels of kings, nobles, and gentlemen, bishops and abbots, and corporate towns, there were a great number of "minstrels unattached," and of various grades of society, who roamed abroad singly or in company, from town to town, from court to camp, from castle to monastery, flocking in great numbers to tournaments and festivals and fairs, and welcome everywhere.

The summer-time was especially the season for the wanderings of these children of song,* as it was of the knight-errant † and the pilgrim ‡ also. No wonder that the works of the minstrels abound as they do with charming outbursts of song on the return of the spring and summer, and the delights which they bring. All winter long the minstrel had lain in some town, chafing at its miry and unsavoury streets, and its churlish money-getting citizens; or in some hospitable country-house, perhaps, listening to the wind roaring through the broad forests, and howling among the turrets overhead, until he pined for freedom and green fields; his host perchance grown tired of his ditties, and his only occupation to con new ones; this sounds like a verse composed at such a time:—

"In time of winter alange § it is !
The fowles lesen || her bliss !
The leves fallen off the tree ;
Rain alange ¶ the countree,"

No wonder they welcomed the return of the bright warm days, when they could resume their gay, adventurous, open air life, in the fresh flowery meadows, and the wide green forest

glades; roaming to town and village, castle and monastery, feast and tournament; alone, or in company with a band of brother minstrels; meeting by the way with gay knights adventurous, or pilgrims not less gay, if they were like those of Chaucer's company; welcomed everywhere by priest and abbot, lord and loon. These are the sort of strains which they carolled as they rested under the white hawthorn, and carelessly tinkled their harps in harmony:—

"Merry is th' enté of May ;
The fowles maketh merry play ;
The time is hot, and long the day.
The joyful nightingale singeth,
In the grene mede flowers springeth."

* "Merry it is in somer's tide ;
Fowles sing in forest wide ;
Swaines gin on justing ride,
Maidens liften hem in pride."

The minstrels were often men of position and wealth: Rayer or Raherus, the first of the king's minstrels, whom we meet with after the conquest,* founded the Priory and Hospital of St. Bartholomew, in Smithfield, London, in the third year of Henry I., A.D. 1102, and became the first prior of his own foundation. He was not the only minstrel who turned Religious. Foulquet de Marseille, first a merchant, then a minstrel of note—some of his songs have descended to these days—at length turned monk, and was made abbot of Tournet, and at length archbishop of Toulouse, and is known in history as the persecutor of the Albigenes: he died in 1231. It seems to have been no unusual thing for men of family to take up the wandering adventurous life of the minstrel, much as others of the same class took up the part of knight adventurous; they frequently travelled on horseback, with a servant to carry their harp; flocking to courts and tournaments, where the graceful and accomplished singer of chivalrous deeds was perhaps more caressed than the large limbed warrior who achieved them, and obtained large rewards, instead of huge blows, for his guerdon.

There are some curious anecdotes showing the kind of people who became minstrels, their wandering habits, their facility of access to all companies and places, and the uses which were sometimes made of their privileges. All our readers will remember how Blondel de Nesle, a minstrel of Richard's court, wandered over Europe in search of his master. A less known instance of a similar kind, and of the same period, is that of Ela, the heiress of D'Evereux, Earl of Salisbury, who had been carried abroad and secreted by her French relations in Normandy. To discover the place of her concealment, a knight of the Talbot family spent two years in exploring that province; at first under the disguise of a pilgrim, till having found where she was confined, in order to gain admittance, he assumed the dress and character of a harper; and being a jocose person, exceedingly skilled in the Gestes of the ancients, he was gladly received into the family. He succeeded in carrying off the lady, whom he restored to her liege lord the king, who bestowed her in marriage—not upon the adventurous knight-minstrel, as ought to have been the ending of so pretty a novel—but upon his natural brother William Longespée, to whom she brought her earldom of Salisbury in dower.

Many similar instances, not less valuable evidences of the manners of the times because they are fiction, might be selected from the romances of the middle ages; proving that it was not unusual for men of birth and station † to assume, for a longer or shorter time, the character and life of the wandering minstrel.

But besides these gentle minstrels, there were a multitude of others of lower classes of society, professors of the joyous science, descending through all grades of musical skill, and of re-

spectability of character. We find regulations from time to time intended to check their irregularities. In 1315 King Edward II. issued an ordinance addressed to Sheriffs, &c., as follows: "Forasmuch as . . . many idle persons under colour of mynstrelsie, and going in messages* and other faigued busines, have been and yet be receaved in other men's houses to meate and drynke, and be not therewith contented yf they be not largely considered with gyftes of the Lordes of the Houses, &c. . . . We wylling to restrayne such outrageous enterprizes and idleness, &c., have ordeyned . . . that to the houses of Prelates, Earls, and Barons, none resort to meate and drynke unless he be a mynstrell, and of these mynstrels that there come none except it be three or four minstrels of honour at most in one day unless he be desired of the Lorde of the House. And to the houses of meaner men, that none come unless he be desired; and that such as shall come so, holde themselves contented with meate and drynke, and with such curtesie as the Master of the House wyl shewe unto them of his owne good wyll, without their asking of any thyng. And yf any one do against this ordinance at the first tyme he to lose his minstrelsie, and at the second tyme to forswere his craft, and never to be received for a minstrell in any house." This curious ordinance gives additional proof of several facts which we have before noted, viz., that minstrels were well received everywhere, and had even become exacting in their expectations; that they used to wander about in bands; and the penalties seem to indicate that the minstrels were already incorporated in a guild. The first positive evidence of such a universal guild is in the charter (already alluded to) of 9th King Edward IV., A.D. 1469, in which he grants to Walter Haliday, *Marshall*, and seven others, his own minstrels, a charter by which he restores a Fraternity or perpetual Guild (such as he understands the brothers and sisters of the Fraternity of Minstrels had in times past) to be governed by a marshal, appointed for life, and by two wardens, to be chosen annually, who are empowered to admit brothers and sisters into the guild, and are authorised to examine the pretensions of all such as affect to exercise the minstrel profession; and to regulate, govern, and punish them, throughout the realm—those of Chester excepted. It seems probable that the King's minstrel, or the King of the Minstrels, had long previously possessed an authority of this kind over all the members of the profession; and that the organisation very much resembled that of the heralds. The two are mentioned together in the Statute of Arms for Tournaments, passed in the reign of Edward I. A.D. 1295. "E qe nul Roy de Harraunz ne Menestrals* portent privez armez:†" that no King of the Heralds or of the Minstrels shall carry secret weapons. That the minstrels attended all tournaments we have already mentioned. The heralds and minstrels are often coupled in the same sentence; ‡ thus Froissart tell us that at a Christmas entertainment given by the Earl of Foix, there were many minstrels as well his own as strangers, "and the Earl gave to Heralds and Minstrelles the sum of fyve hundred frankes; and gave to the Duke of Tourayne's mynstrelles gowns of cloth of gold furred with ermine, valued at 200 frankes." ‡

[To be continued.]

* In the MS. Illuminations of the thirteenth and fourteenth centuries, the messenger is denoted by peculiarities of equipment. He generally bears a spear, and has a very small round target (or, perhaps, a badge of his lord's arms) at his girdle. In the fifteenth century we see messengers carrying letters openly, fastened in the cleft of a split wand.

† It is right to state that one MS. of this statute gives Mareschans instead of Menestrals; but the reading in the text is that preferred by the Record Commission, who have published the whole of the interesting document.

‡ In the romance of Richard Cœur de Lion we read that, after the capture of Acre, he distributed among the "heralds, disours, taborners, and trompours," who accompanied him, the greater part of the money, jewels, horses, and fine robes, which had fallen to his share. We have many accounts of the lavish generosity with which chivalrous lords propitiated the favourable report of the heralds and minstrels, whose good report was fame.

* In the account of the minstrel at Kenilworth, subsequently given, he is described as "a squire minstrel of Middlesex, that travelled the country this summer time."

† "Miri it is in somer's tide,
Swaines gin on justing ride."

‡ "Whanne that April with his shour's sote," &c.
‡ "Tban longen folk to gon on pilgrimages,"

§ Tedious, irksome.

|| Lose their.

¶ Renders tedious.

* The king's minstrel, who is recorded in Domesday book as possessing lands in Gloucestershire, was the minstrel of the last of the Saxon kings.

† Fontenelle ("Histoire du Théâtre," quoted by Percy) tells us that in France, men, who by the division of the family property, had only the half or the fourth part of an old seignorial castle, sometimes went rhyming about the world, and returned to acquire the remainder of their ancestral estate.

RELIGION CONSOLING JUSTICE.

FROM THE MONUMENT BY J. EDWARDS

THIS very beautiful example of monumental sculpture, from the chisel of Mr. J. Edwards, is erected, in memory of the late Right Hon. Sir J. B. Bosanquet, one of the Judges of the Court of Common Pleas, in the church of Dingestow, Monmouthshire.

Mr. Edwards is a young sculptor, whose works in the Royal Academy have in more than one instance called forth our special approbation; he possesses talents of no common order, which only require a prominent field of labour, and to be more widely known, to be fully appreciated. His mind appears amply stored with such qualifications as are essential to make a great artist, and there is little doubt of his becoming one, with suitable opportunities for developing what is in him.

We cannot do better, by way of describing this monumental group, than give the sculptor's own ideas of his composition: these will show what he has desired to represent, and they will also prove him to be a man of deep and earnest thought, purposing to make his Art elevated and intellectual. Mr. Edwards has furnished us with the following remarks on the subject:—"My first and chief object was to aim—so far as I could by sculptural treatment—at representing 'Religion and Justice' as the twin daughters, so to speak, of Wisdom and of High Feeling; these latter being, of course, ultimately traceable to the Eternal. This view of the subject was necessary to accord, so far as practicable by me, with the profound and refined mental characteristics of the distinguished judge to be commemorated, in whom religion and justice, in their highest form, shone as salient qualities of the mind. My next object was to take care, in order to continue in keeping with the mental characteristics just named, that the twin sisters in the group should be free from all affectation and display, and that 'Religion' should have nothing *prominently* apparent but humble and earnest trust in God. In the figure of 'Justice'—from her being, in my view of the subject, less imbued, perhaps, by faith than her sister, it was necessary to have a deep but subdued grief indicated, such as great natures can alone feel at the heavy amount of human woe directly and indirectly connected with the stern necessity that Equity should ever drive Iniquity away, even by the unbending terrors of the law, where holy love, religion, and morality fail: this deep grief of 'Justice' being subdued by the consoling influence of her sacred sister, 'Religion,' who, in the moment chosen for illustration in the design, looks up in earnest trust to God."

We apprehend that few of our readers will be disposed to consider that Mr. Edwards has failed to carry out the spirit of his conception, for the work exhibits a profoundly religious sentiment, expressed with much poetic feeling, while the whole is treated in a truly skilful and artistic manner. All the accessories of the work are in complete harmony with its leading ideas, and evidence the study which the sculptor gave to the subject to render it perfectly. The monument is executed in the finest Italian marble.

In such sculptured works as these there is a large and important field for the labours of the artist, where due encouragement is afforded him: Mr. Edwards has already done good service therein: he has executed monuments to the sixth and seventh Dukes of Beaufort, and is at present, we believe, engaged upon a similar memorial of the late Duchess of Beaufort. In St. Botolph's Church, Colchester, is also an elegant monument from his chisel to the memory of W. Hawkins, Esq., and two of his children; another at Berechurch, Essex, to Mrs. White, besides others we have not space to point out. Among the ideal subjects for reliefs and statues which he has exhibited at the Royal Academy and the Industrial Exhibition of 1851, we may name "The last Dream," "The Daughter of the Dawn," "The Spirit ascending," "The Weary re-assured," "A Philosopher instructing a Youth," and "The High Priest of Science." Most of these works have been favourably spoken of by us at various times.

THE COLLECTION OF THE LATE SAMUEL ROGERS.

THE gatherings of a long life, selected with the refined taste of a poetic mind, and long renowned in private circles, have invested with an unusual interest the sale of works of Art and *virtu* which adorned the house of Samuel Rogers the poet. It is seldom that so important a series of pictures appears for sale, numbering among them works which are of European renown, with others belonging to a few prominent names in the English school, which have risen to greatness during the life of the collector, and are curiously instructive to those who watch the steady progress of true genius even in its "money value" merely. We allude to such pictures as LESLIE's small original of 'Sancho and the Duchess,' for which the artist obtained 100*l.*, and Rogers paid 70*l.*, but which has now realised 1120 guineas, although the artist has painted *replicas*, one of which adorns the Vernon Gallery. The same artist's curious picture of 'The Lady Teaching a Child to Read,' and which was painted for Mr. Rogers from MARC ANTONIO's engraving of RAPHAEL's design, realised 320 guineas: it cost Rogers about one-sixth of that sum. Such lessons should not be lost on men who have taste and power to patronise Art by direct communication with artists, thus profiting giver and receiver.

The 226 pictures forming this collection have realised 30,000*l.*: they were sold by Messrs. Christie and Manson on the 2nd and 3rd of May. The most important of the British school were those by REYNOLDS; it is seldom that we see such fine and pure works of the master as Rogers possessed. 'The Strawberry Girl,' and 'Puck,' have both become types of certain qualifications appertaining to English growth in Art. It is to be regretted that Rogers did not bequeath these pictures to our nation, for they belong so peculiarly to the National Gallery that we shall ever regret their absence from its walls. The first fetched 2100 guineas, the second 980 guineas. Sir Joshua's own criticism on the first was "no man can produce more than half-a-dozen really original works, and that is one of mine." It is a charming impersonation of the arch diffidence of childhood, and perhaps there can be no stronger instance of the strange sort of descriptive criticism that may come from the highest authorities in Art than that appended to this picture in the sale catalogue;—Sir Thomas Lawrence speaks of it as "that magnificent display of impudent knowledge that kicks modesty out of doors," and which can call up no other idea than that of a Nell Gwynne offering fruit at a theatre door, whose beauty can alone excuse her impertinence; and yet the picture is that of a simple child of some four years of age, whose natural shyness is only dispelled by a twinkle of frank pleasure, as a playmate or protector is recognised. The 'Puck' is the well-known picture painted for Boydell's Shakespeare Gallery. 'Puck' is a mischievous baby seated on a toadstool, having the ears of a fawn to disassociate him from the human world, but having no more resemblance to the poet's great creation than 'Hamlet to Hecuba.' As a picture, or as an invention, it is an extraordinary work, but no such "realisation" of our national poet could be received from a modern artist in these days of Shaksperian criticism, and nothing can show its advance since the time of Boydell more than this work of Reynolds. The collection was particularly rich in the first President's works, and they exhibited his beauties and his faults most thoroughly, as well as the fatal decay to which he condemned them by his unfortunate taste for speculating in "vehicles." 'The Girl Sketching' is covered with cracks, and 'The Cupid and Psyche' positively unpleasant to look at from the tones which the glazings and tints have assumed. The first fetched 350 guineas, the second 400. A beautiful small copy, by Sir Joshua, of Vandyke's 'Marquis of Huntley,' in the best and purest style, only realised 55 guineas. 'The Mob Cap,' forming the principal figure in his famous picture of 'The Infant Academy,' was bought for 780 guineas, though exceedingly slight in style,

and looking little better than a mass of dirty paint."

A small 'Sea-piece,' by J. M. W. TURNER, painted in early life, but displaying none of the peculiarities which made him great, was purchased for 182*l.* 14*s.*; WILKIE's 'Death of the Red Deer,' also a small picture, brought 375 guineas. HAYDON's small *replica* of 'Napoleon on the Shore of St. Helena,' 65 guineas. Sir CHARLES EASTLAKE's 'Sisters,' realised 380 guineas, and LESLIE's 'Princes in the Tower,' 225*l.* 15*s.*

Of the Italian School, the most important picture was RAFFAELLE's 'Madonna and Child' for purity of composition and sweetness of expression; it realised only 504*l.*, less than was paid for it by Mr. Hibbert at the sale of the Orleans Gallery. The finest Flemish picture went also cheaply, a TENIERS, representing a 'Witch quitting Inferno'; this picture was so much admired by Sir Joshua Reynolds that to obtain it from Dr. Chauncey, who then possessed it, he gave three of his own productions, and two others by celebrated masters. This really extraordinary work was in the purest and finest condition, as brilliant as the day it was painted, admirably displaying the clearness of touch and quaint fancy of the master. It was secured by Dr. Seymour for 315*l.*; it should have been in the National Gallery. RUBENS' copy of the fresco by ANDREA MANTEGNA of the 'Triumph of Julius Caesar' was purchased for that institution at the price of 1102*l.* 10*s.* Rubens seems to have set much value on this early study, and would never part with it; it is named in the inventory of his effects made after his death, and was sent by Sir Balthazar Gerbier to our Charles I., pending the possible purchase of the collection by that monarch.

The most remarkable early work of Art was the miniature oil-painting by VAN EYCK representing 'The Virgin with the Infant Saviour in her lap,' seated beneath an elaborate Gothic niche. It covers but a few inches of surface, but they are characterised, as Waagen remarked, by "the *ne plus ultra* of delicacy and precision." In the convolutions of the Gothic tracery are represented 'The Seven Joys of the Virgin,' so minutely pencilled as to require a magnifier to comprehend them, and yet all is done with a vigour of touch and power of effect the most surprising. It was purchased by Mr. Rogers from Mr. Aders for 130*l.*, and was now sold for 255 guineas. Next in interest was the portrait of 'Himmelinck, by himself,' dated 1462, and which Rogers obtained also from Mr. Aders; it represents the artist in the dress of the hospital of St. John at Bruges, where he died, and where is still preserved his *chef d'œuvre*, the reliquary of St. Ursula, covered by him with the most minute and beautiful paintings. This curious picture is engraved by Passavant for his notice of the artist and his works; it was sold for 86 guineas. The figures of St. John and St. Mark, by LUCAS VAN LEYDEN, are curious for the engraver-like character of their handling, a peculiarity which is also distinctive in the works of Albert Dürer, of whose powers Mr. Rogers possessed some fine examples in drawings, but the paintings called his we should greatly doubt as the work of his hand. The drawings were all striking specimens of Dürer's precision and truth; the portrait of the Duke of Saxony, most carefully executed with the pen, realised 7*l.* Lucas Van Leyden's equally elaborate pen drawing of the Emperor Maximilian brought 20*l.* But the highest price realised by any of the drawings was 440 guineas for RAFFAELLE's study for 'The Entombment of Christ.' It was formerly in the Crozat collection, and cost Rogers 120*l.*

The two works by Cimabue, consisted of a small picture of 'The Virgin enthroned amid Saints,' on a characteristic gold ground. It fetched 52*l.* The other represented 'an Evangelist writing,' and formerly belonged to Otley. The hand of Giotto was said to be seen in a beautiful small work representing 'The Virgin and Child with Angels.' Dr. Waagen, however, attributes this work to Benozzo Gozzoli. It fetched 310 guineas. A genuine work of this rare master, however, appeared in a small fragment of fresco from the church of the Carmelites at

RELIGION CONSOLING JUSTICE.

FROM A MONUMENT BY J. EDWARDS

TO THE LATE RIGHT HON^{BLE} SIR JOHN BERNARD BOSANQUET, ONE OF HER MAJESTY'S JUDGES.

DRAWN BY F. R. ROFFE. — ENGRAVED BY R. A. ARTIETT.

LONDON, PUBLISHED FOR THE PROPRIETORS.

Florence, saved from the fire which destroyed it about 100 years since; it represents the heads only of St. Peter and St. John, bowed with deepest sorrow, as their clasped hands are raised upwards. It has the grotesque character of earlier Art, combined with a power of thought and intensity of expression for which the Florentine was famous, and which again raised Art into vitality. A LORENZO DI CRIDI, the "Coronation of the Virgin," almost equal to RAFFAELLE, and displaying this rare master to great advantage, fetched 380 guineas; GAROFALO's 'Riposo,' sold for 588*l.*; GIORGIONE's 'Knight and Lady,' 88 guineas. The celebrated BAROCCIO, 'La Madonua del Gatto,' from the Salvati Palace, Rome, and which was used in retouching the same subject in our National Gallery, realised 200 guineas. TINTORETTO's 'Miracle of St. Mark' brought 430*l.* 10*s.*; it is a powerful sketch for the great work now in the Venetian Academy.

Mr. Rogers selected three pictures to be ever before his eye. They were placed over his writing-table, near the bow-window of a room on the first floor, overlooking the Green Park. One was by RAFFAELLE, and was originally part of a *predella* to the altar of the Nuns of St. Anthony, at Perugia; its subject was 'Christ in the Garden of Gethsemane.' Another was 'The Mill,' by CLAUDE; and the third 'The Virgin and Saints,' by L. CARRACCI. The RAFFAELLE realised 450 guineas; the CLAUDE, 660 guineas; and the CARRACCI, 160 guineas. It has seldom fallen to the lot of authors, particularly of the poetic tribe, to refresh their eyes by decorating their walls with works of art, whose money-value nearly reaches thirteen hundred pounds!

In portraiture we may note the finished study by TITIAN for his grand picture of 'Charles V. of Spain, riding in a suit of tilting armour,' which sold for 195 guineas; and the more finished and rarer VELASQUEZ, the boy Don Balthazar, son of Charles IV. of Spain, on a black horse, with the Tennis-Court at Madrid in the background; this striking picture realised 1270*l.* 10*s.* HOLBEIN's 'Cesar Borgia,' a very fine picture, fetched 81 guineas.

The landscapes included some fine studies by CLAUDE, POUSSIN, REMBRANDT, RUBENS, and VAN DER NEER, as well as our own WILSON and GAINSBOROUGH. The highest price was paid for NICHOLAS POUSSIN's 'Campagna of Rome,' bought by Lord Fitzwilliam for 1029*l.* RUBENS' 'Waggon Landscape' fetched 640*l.* 10*s.*; and his 'Solitude' 310 guineas; they are both characterised by grandeur of design and power of execution.

Of the pictures not hitherto noticed, we may point out:—'A Group of five Peasants, seated round a table, smoking,' TENTERS, 101 guineas; 'A Knight on a white Horse trampling on a Moorish Prince,' B. VAN ORLEY, or BERNARD of Brussels, 100*l.*; 'A Masquerade,' WATTEAU, 155 guineas; 'A Concert,' the companion picture, 175 guineas; 'A Roman Villa,' CLAUDE, from the Orleans gallery, 135 guineas; 'Portrait of an Italian Lady,' A. VEROCCHIO, 185 guineas; 'A Lady and Cavalier,' WATTEAU, 140 guineas; 'The Horrors of War,' a small *replica* of the large picture by RUBENS in the Pitti Palace, 200 guineas; 'A Woman with a Bird on her hand, at which a Child is looking intently,' from the Borghese Palace, GUERCINO, 300 guineas; 'The Virgin, with an Infant in her lap, presenting the Cross to St. Francis,' PALMA, 315 guineas; 'A Forest Scene, with Figures,' REMBRANDT, 250 guineas; 'The Dead Christ watched by two Angels,' a *replica* of the picture by GUERCINO, in the National Gallery, 155 guineas; 'The Adoration of the Shepherds,' N. POUSSIN, 110 guineas; 'Woody Landscape,' GASPARD POUSSIN, 166 guineas; 'A Classical Landscape,' by the same, from the Colonna Palace, 151 guineas; 'A Party of Ladies and Cavaliers,' WATTEAU, 140 guineas; 'The Birdcatchers,' DOMENICHINO, from the Borghese Palace, 120 guineas; 'The Infant Christ,' DOMENICHINO, 145 guineas; 'Philip IV. of Spain,' VELASQUEZ, 205 guineas; 'The Adoration of the Magi,' G. BASSANO, 130 guineas; 'The Good Samaritan,' G. BASSANO, 230 guineas; 'The Infant and St. Francis,' MURILLO, 230 guineas; 'Mary Magdalen anointing the

Feet of Christ,' P. VERONESE, 380 guineas; 'Portrait of Rembrandt,' by himself, 310 guineas; 'St. Joseph embracing the Infant Christ,' MURILLO, 380 guineas; 'Christ discovered by his Parents disputing in the Temple,' MAZZOLINO DI FERRARA, 500 guineas; 'La Gloria di Titiano,' TITIAN, 270 guineas; 'The Battle between Constantine and Maxentius,' RUBENS, 260 guineas; 'The Virgin, Infant, and St. Joseph,' CORREGGIO, 240 guineas. These prices will serve to show that genuine pictures by the old masters yet find favour with collectors; the majority of these works, moreover, are of cabinet size, perhaps a reason why they are so much coveted.

But the sums paid for English paintings, as already instanced, must leave our artists nothing to complain of; the competition for these was as great as that for the ancient works. Stothard's 'Canterbury Pilgrims,' and its companion, 'The Principal Characters of Shakespeare,' sold respectively for 103 guineas, and 102 guineas. The other principal pictures were—'Italian Landscape,' R. WILSON, 130 guineas; 'Girl with a Bird,' REYNOLDS, 230 guineas; 'Woody Landscape,' REYNOLDS, 105 guineas; 'Landscape, with Peasants in a Cart, crossing a Stream,' GAINSBOROUGH, 250 guineas; 'The Sleeping Girl,' REYNOLDS, 150 guineas; 'Landscape, with a Cottage near a Stream,' GAINSBOROUGH, 120 guineas; 'View from Richmond Hill,' REYNOLDS, 430 guineas; 'Adrian's Villa,' R. WILSON, 135 guineas; 'Mæcenas's Villa,' R. WILSON, 130 guineas; 'Italian Landscape, with Cattle and Peasants on the Banks of a River,' R. WILSON, 195 guineas.

We have still a few additions to make to the sales of Mr. Rogers's collection: FLAXMAN's statuette of 'Cupid,' executed for its late owner as a companion to his 'Psyche,' sold for 115 guineas; the 'Psyche,' for 185 guineas; ROUBILIAC's bust of Pope, in terra-cotta, 137 guineas; a pair of plaster statuettes, never executed in marble, of Michael Angelo and Raffaele, modelled for Sir T. Lawrence, 34 guineas. Of framed drawings, RAFFAELLE's 'Virgin, Infant Christ, and St. John,' in red chalk, pen and ink, sold for 140 guineas; 'The Entombment,' another by RAFFAELLE, purchased by Mr. Rogers from the Crozat collection for 120 guineas, now realised 440 guineas.

The drawings collected by Mr. Rogers were equally indicative of his varied and correct taste. Specimens by our own STOTHARD enormously preponderated, and exhibited the great versatility and purity of his fancy; but the finest examples of the British School were the sketches by FLAXMAN, for his immortal illustrations to 'Æschylus,' 'Homer,' and 'Dante,' works which have done most to raise the English School of Design in the estimation of Europe, but which are not yet fully comprehended in England.

The sale began with antiquities, and ended with books and coins. It will thus be perceived that the poet was a general collector, and valued all that a true connoisseur should cherish, restricting himself to no particular style or age in Art. The bent of his taste led him to the Classic, and he was richest in Greek works. It is seldom that so fine a collection of vases and antique Greek gold is brought to public sale, and it speaks better for public taste than has lately been exhibited, when we find they have realised good prices. It has lately been the case, that noble vases of Greek work, of the best period of Art, have sold for one-half the price realised by some painted abortion of the Renaissance, or comparatively modern work of Dresden, Sèvres, or even Chelsea. This is termed "fluctuation of taste," but it should rather be called its "decadence." We are, therefore, glad that the predictions uttered before the sale, have not been realised. The 'Cylind' which the poet kept under a glass, on a small table in his drawing-room, and which was painted with figures of 'Athletæ preparing for the Stadium,' all delineated with a perfection of beauty and truth, in simple outlines on its surface, fetched 51 guineas. An 'Amphora,' with a representation of 'Theseus slaying the Minotaur,' sold for 90 guineas; and the large vase, with the 'Marriage of Bacchus and Ariadne,' which once decorated the ante-

room of Rogers's House, realised 40 guineas. The bronzo candelabrum, at the foot of which was seated a Roman lady in a chair, which is said to have suggested the form of those used by Rogers in his dining-room, was sold for 51 guineas; it was, however, but the wreck of a fine work. It was recovered from the sea at Puzzuoli, and was blistered and corroded so much, that in some places it looked only like a mass of metal. A more curious work was the Roman *Bulla* in gold, inscribed with the name of the young patrician, Hostus Hostilius, for whom it was fabricated. It was found in 1794, and secured by Bellotti, from whom Rogers purchased it, he having before refused 100 louis-d'or for it; it now sold for the very moderate sum of 56*l.* 14*s.*

The sale has exhibited the usual fluctuations and caprices which characterise the auction-room; and our notes exhibit in some degree this usual accident in such localities; but not so marvellously as an instance which occurred on the second day, when Michael Angelo's terra-cotta study for the figure of 'Lorenzo di Medici' upon his tomb at Florence, was bought for 28 guineas, while two modern French bronze copies of the figures upon the same tomb, sold for 90 guineas each. Such caprices are not reducible to reason, and show that good things and bad run equal chances beneath the auctioneer's hammer. The gross receipts of the sale are, however, satisfactory; and so is the opinion it helps us to form of the state of public taste, as exhibited at this the most important sale of the present season.

PICTURE SALES.

On the 5th and 6th of May, Messrs. Foster & Son sold, at their rooms in Pall-Mall, a very interesting collection of English pictures and drawings, "selected with much judgment and great knowledge of art by an amateur resident in the north;" the majority of the works, 188 in number, were certainly of a good class, and from the pencils of a large number of our best painters. Among the highest-priced oil paintings were 'The Golden Age,' F. DANBY, A.R.A., bought by Mr. H. Graves, for 241*l.* 10*s.*; 'Queen Blanche, ordering her son, Louis IX., from the presence of his Wife,' A. ELMORE, A.R.A., 231*l.*, also by Mr. Graves; 'Dolly Varden,' by W. O. FRITH, R.A., 199*l.* 10*s.*, by Mr. Wallis; 'Patricio and the Ladies at Breakfast,' A. EGG, A.R.A., 141*l.* 15*s.*, by Mr. Meers; 'The Master is come, and calleth for thee,' F. STONE, A.R.A.; 'Early Morn,' J. SANT, 178*l.* 10*s.*; 'English Homestead,' T. CRESWICK, R.A., 103*l.* 19*s.*, purchased by Mr. Parnell; 'Fruit and a Cinquecento jewelled Canto,' G. LANCE, 99*l.* 15*s.* Of the drawings we may point out WEHNERT's 'Caxton's Printing Press,' sold for 110*l.* 5*s.* to Mr. Copp; 'Hunt the Slipper,' the sketch, we believe, for the larger oil-painting by F. GOODALL, A.R.A., bought by Mr. Lambert; 'The First of September,' F. TAYLER, 59*l.* 17*s.*, by Mr. Vokins; 'The Watering Place,' D. COX, 44*l.* 2*s.*; 'The Forest,' J. LINNELL, 38*l.* 17*s.* by Mr. Wallis; 'Rough Water,' C. STANFIELD, R.A., 33*l.* 1*s.* 6*d.*; 'Flowers and Holly,' W. HUNT, 26 guineas.

The collection of English pictures belonging to Mr. Fairlie was sold by Mr. Phillips on the 22d and 23d of April: among them was TURNER's poetical landscape, 'The Temple of Jupiter,' painted in 1818, and well-known from the engraving: it was knocked down to Mr. Gambart for 1,365*l.*; a small picture by Sir E. LANDSEER, 'Puppy and Frog,' sold for 304*l.* 10*s.*; 'Fidelity,' REYNOLDS, 210*l.*; 'A Border Raid,' T. S. COOPER, 378*l.*; 'View above the Slate Quarries, on the River Agmen,' the joint production of F. R. LEE and T. S. COOPER, 409*l.* 10*s.*; 'A River Scene,' F. R. LEE, 178*l.* 10*s.*; 'The Choice of Hercules,' D. MACLISE, 320*l.*; 'Doubtful Weather,' T. CRESWICK, 252*l.*; 'The Terrace, Haddon Hall,' T. CRESWICK, 140*l.* 14*s.*; 'Madge Wildfire and Jeannie Deans,' W. P. FRITH, 115*l.* 10*s.*; 'The Woodman's Return,' F. GOODALL, 246*l.* 15*s.*; 'Return from Deer-Stalking,' R. ANSDALL, 120*l.* 15*s.*;

'Youth at the Helm and Pleasure at the Prow,' ETTY, the sketch for the larger picture bequeathed to the nation by Mr. Vernon, 168*l*.; 'The Nursery,' WILKIE, 115*l*. 10*s*.; 'Coast-Scene after a Storm,' MORLAND, 115*l*. 10*s*.; 'View in Switzerland,' P. NASMYTH, 152*l*. 5*s*.; 'Peasants Returning from the Fiesta del Monte Virgine,' T. UWINS, 125*l*. 15*s*.; 'Shrimpers,' W. COLLINS, 147*l*.; 'The Young Anglers,' T. WEBSTER, 117*l*. 2*s*.; 'The Fortune Hunter,' R. REDGRAVE, 102*l*. 18*s*.

THE BRITISH INSTITUTION.

THE following is, so far as we could collect, a list of the pictures sold at the British Institution up to the day of its closing.

'Timber Clearing on the Hill-side, Sussex,' H. JUTSUM, 120*l*.; 'The Egyptian Ivory Merchant,' F. DILLON, 105*l*.; 'The Monte Rosa—Early Morning,' G. E. HERING, 105*l*.; 'The Alhambra, Granada,' W. TELBIN, 100*l*.; 'A Study,' J. LUCAS, 100*l*.; 'A Stiff Breeze, Plymouth Sound,' E. F. PRITCHARD, 77*l*.; 'Traces of Past Winters,' H. JUTSUM, 70*l*.; 'Dunelly Castle, near Oban, Scotland,' J. DANBY, 63*l*.; 'Glenmorfa, Caernarvonshire,' J. W. OAKES, 75*l*.; 'A Natural Reflection,' J. D. WINGFIELD, 84*l*.; 'Don and Sancho,' T. EARL, 63*l*.; 'Cupid and Psyche,' C. BURLISON, 50*l*.; 'On the Thames—the close of a Summer's Day,' H. J. BODDINGTON, 70*l*.; 'Maternal Love,' G. E. HICKS, 42*l*.; 'Welsh Wool Picking,' D. W. DEANE, 40*l*.; 'San Clemente, on the Lagoon of Venice, Sunset,' E. W. COOKE, A.R.A., 36*l*. 15*s*.; 'Roman Piper,' R. BUCKNER, 42*l*.; 'Sunset,' W. A. KNEEL, 35*l*.; 'Lockhurst Hatch Farm, Surrey,' J. DEARMAN, 36*l*. 15*s*.; 'Sunny Hours,' J. D. WINGFIELD, 25*l*.; 'Fishing Craft, &c., in a Calm,' W. A. KNEEL, 25*l*.; 'Vessel Ashore, Ryde Pier,' E. HAYES, 25*l*.; 'Netley Mill, Shire, Surrey,' J. DEARMAN, 26*l*. 5*s*.; 'The Passing Thought,' E. HUGHES, 21*l*.; 'Sun-rise on the Western Coast of Scotland,' J. DANBY, 30*l*.; 'Cattle by a River Side,' J. DEARMAN, 21*l*.; 'Abbeville, France,' L. J. WOOD, 21*l*.; 'Age and Innocence—an Interior at Kellin,' W. LUKER, 21*l*.; 'Interior, Dogs,' &c., G. ARMFIELD, 20*l*.; 'Gleaners,' J. BOUVIER, 18*l*.; 'Happy Hours,' Miss K. SWIFT, 18*l*. 18*s*.; 'Summer-Time,' J. SURTEES, 26*l*. 5*s*.; 'A Dead Moss Trooper,' T. MORTON, 15*l*. 15*s*.; 'A Son of the Soil,' J. COLLINSON, 15*l*. 15*s*.; 'Cupid Teasing a Butterfly,' J. C. NAISH, 15*l*.; 'Portal of the Cathedral at Chartres,' L. J. WOOD, 15*l*. 15*s*.; 'High Street, Tewkesbury,' W. CALLOW, 15*l*. 15*s*.; 'Azaleas,' Miss MUTRIE, 15*l*. 15*s*.; 'The Surprise,' H. B. GRAY, 15*l*.; 'Cathedral at Lille, France,' L. J. WOOD, 14*l*. 14*s*.; 'Market Group,' J. PEEL, 14*l*.; 'The Swing,' H. SHIRLEY, 12*l*. 12*s*.; 'A la Ducasse, Pas de Calais,' F. STONE, A.R.A.; 'Jane,' J. COLBY; 'Severe Weather,' R. PICTURE-DEALING IN GLASGOW.

WE copy the following statement from the *Bristol Times*:—"A good deal of gossip amongst the lovers of the Fine Arts has been going on during the last day or two, with reference to the following circumstance, which, though at first sight it may appear somewhat equivocal, is capable of the fullest explanation, so far as some of the parties are concerned. Mr. Plateau, the eminent London picture-dealer, has (as our readers are aware) been for the last fortnight in Bristol, with a large collection of pictures; a few days since, he sold to Mr. Sampson, picture-frame maker, &c., of this city, a little painting, called 'The Black Frost,' by Branwhite. The next day, Mr. Branwhite happening to be in Mr. Sampson's shop, the latter mentioned the circumstance to him, when Mr. B. stated that he had sold to Mr. Plateau two little pictures, one of which bore that name, and expressed a wish to see it; but, on his first glance at the painting, he pronounced it a bad copy of his picture, though in the identical frame in which the original was, when he sold it to Mr. Plateau, from whom, however, Mr. Sampson had got a warranty for the genuineness of the work. Mr. Plateau was immediately applied to by both Mr. Sampson and Mr. Branwhite, and appeared no less surprised than they were at the circumstance. He at once, upon reflection, was able to account in some measure, for the substitution of the forgery for the original; he said he hoped he need not say much—leaving his reputation out of the question—to convince them, or any one, of the impossibility of his being so infatuated as wittingly to bring a forgery for sale, with a warranty, to the place where the artist lived, and where any such attempt must be at once detected. Between the time of his purchasing the picture from Mr. Branwhite, however, and his selling a picture to Mr. Sampson, it was clear a bad copy had been changed for the original in its own frame, and he accounted for it in this way:—When in Glasgow, on a business visit, he sold, for 12*l*, Mr. Branwhite's picture, which was a very small one, to a frame-maker and dealer there, with whom he had other transactions; when leaving Glasgow, however, the man said to Mr. Plateau, 'the gentleman for whom I purchased that little frost piece, does not like it, and I wish you would take it back.' Mr. Plateau having had many transactions with the man, did so, never pausing to look particularly into the one he got back, and which was the same that he sold in Bristol to Mr. Sampson. Mr. Plateau (and Mr. Branwhite, too), have no doubt that the picture was copied during the month it was out of his possession at Glasgow, and Mr. Plateau, who is naturally much annoyed at the imposition practised on him, has prevailed on Mr. Branwhite to accompany him to Glasgow, in order to take instant steps for the discovery of the fraud, and punishment of the offender. Mr. Plateau's object in having Mr. Branwhite's company (he, Mr. F., bearing all the expenses of the journey, &c.), is that Mr. Branwhite may be able to swear to the identity of the true picture, when they have traced it to its present possessor, which, we trust, they will be able to do. We hardly need add that Mr. Plateau returned the money to Mr. Sampson, on his bringing back the picture."

A correspondent has furnished us with the following additional particulars respecting this transaction:—"Mr. Sampson started for Glasgow and arrived there the same night. The next morning he called at the shop of Messrs. Rankin and Gray, carvers and gilders of Union Street, the parties to whom Mr. Plateau had sold the original picture—it being early (about 8 A.M.) he found nobody at the shop but a woman of whom he asked some questions respecting a frame of a complicated and difficult pattern. The woman not understanding the kind of frame he had described, he took the opportunity of waiting and looking over the pictures, and after a search of some time he was gratified by a sight of the picture he was looking for—he discovered it behind the counter with its face turned to the wall and covered with a sheet of plate-glass. Upon seeing the picture he said nothing to the woman about it, but immediately proceeded to Mr. Crichton, a solicitor, to whom he had brought a letter of introduction. Mr. Crichton at once took means for having the picture restored to Mr. Plateau, and the following letter will show what success.

UNION STREET, GLASGOW,
22nd April, 1856.

SIR.—We regret to find that in a sale by us to you, you were led to form the idea that you were purchasing the original of the picture "Black Frost," by Charles Branwhite, in place of a copy which we had got made and framed, and on the circumstances which attended the transaction being reviewed, we are bound to admit that we were to blame in causing the mistake, and we therefore feel it incumbent upon us to make some sacrifice to compensate you for the expense you have incurred. It appears we were not, strictly speaking, entitled to make a copy, and we therefore allow it to be destroyed; we also hand you the original that you may have equal value for your money, and as agreed upon, we pay you twenty pounds towards your expenses.

We are, Sir, your obedient Servants,

Signed—RANKIN & GRAY.

ALEXANDER W. CRICHTON, of Glasgow,
Solicitor;

JAMES SAMPSON, No. 10, Park Street,
Bristol;

Witnesses to the signature of Messrs.
Rankin & Gray.

To L. V. FLATEAU, ESQ.,
Of London and Bristol."

This contribution to the history of a picture will amuse more than it will astonish: it is the latest but not the most remarkable incident of its class. All we now desire to know is, what has become of "the copy?" If it be true, as we are told it is, that it has not been destroyed (as it ought to have been), Mr. Plateau has made a good thing of "the business,"—having the picture, the copy, and twenty pounds "towards his expenses."

THE WINTER'S TALE, AT THE PRINCESS' THEATRE.

IF Shakspeare—who threw off his wonderful dramas for the use of a stage unable to give them the advantages of scenery and dresses—could, after the lapse of two centuries and a-half, revisit a modern theatre, and find all the critical knowledge, antiquarian lore, and scenic appliances, which have been growing to perfection during that long period, devoted to his works; and those works still as attractive as they were upon the first night, when he produced them at the Globe Theatre, on the Bank-side; it would be the greatest ovation that ever awaited man,—a triumph over the usual oblivion which follows in the wake of time, accorded to very few of the "Muse's darlings." When works cast off with the ease of a powerful genius, working out its own end untrammelled by conventionalities, and entirely careless of

anachronisms, are restored with archaeological exactitude to the stage, which thus resuscitates the living pictures of bygone ages for the gratification and instruction of the present; the theatre reflects a new charm upon a great work, asserts its true position as the vivid exponent of life in all phases; and takes due rank among the fine arts, aided by poetry, painting, and music.

No one of the works of our great dramatist abounds with more anachronisms than the "Winter's Tale." The scene is Bohemia, yet is that country supposed to be bordered by the sea. The decision of the great Delphic oracle is the chief moving agent of the action of the play; yet we hear of "Christian burial," of "an Emperor of Russia," "that rare Italian master, Julio Romano," and a "chapel" for the statue of Hermione; while Autolytus and the country-people are so essentially English of the time of Elizabeth, in thought, word, and deed, that they, more than any other characters in the play, fix it in the poet's era. It is impossible to appreciate Mr. Kean's difficult labour in reducing all this to something like congruity, unless we reflect on these facts. To ensure success he has adopted the suggestion of Hammer to substitute Bithynia for Bohemia, preserve the classic era throughout as the period of the action of the drama, "when Syracuse was in no way inferior to Athens in magnificence, and place before the eyes of the spectator *tableaux vivants* of the private and public life of the ancient Greeks and Phrygians." Such portions of dialogue, or passing allusions to more modern events or things have consequently been omitted, and our business will now be to speak of the artistic resuscitation of a past age afforded by Mr. Kean's stage.

The opening scene presents little more than the usual classic background; the second scene ambitiously commences the picture of early Greek manners, so carefully and conscientiously given throughout the drama. The guests in the banquetting-hall of the palace of Leontes are reclining on their gilded couches, attended by youths who wreath them with flowers, while attendants bring forth wine in amphoræ, to mix in the capacious vase over which the symposiarch, or chief butler, presides, and re-serves it by a *simpulum* into the cups of the guests. The girls, bearing the painted wine-vessels on their heads, come forth with all the grandeur of antique statuary; and the careful manner in which the whole scene has been studied, is displayed in every minute trait. The vessels are borne upon the head horizontally when emptied, and the student of antique marbles, at once recognises the figures he gazes on as studies from the friezes of the Parthenon. The Pyrrhic dance in this scene is also a wonderful realisation of the old Greek warrior, in which no feature of his picturesque or martial attire is omitted; nor are the groups into which these soldiers are thrown without direct authority in antique sculpture.

The court of the Gynæconitis, where Hermione is seated among her women, employed like Penelope and her maids—is another charming realisation of the domestic life of Greece. The queen seated between her baskets of coloured wools, and her ladies busied with distaff and spindle, while the young Mamilius plays with his toy chariot in the open corridor, looking upon the quiet garden, with its richly flowering shrubs, is a charming picture of classical repose. Equally beautiful is the tapestried room looking out on the city and bay; the effect of the atmosphere is here happily rendered—the deep blue of the sky, the warm tint of the hills, and the transparency of the shadows, realise the climate of the "happy south," with a truth that can only be fully appreciated by those who have travelled there.

The third act is devoted entirely to the trial of Hermione, which takes place in the theatre of Syracuse; and here we feel called upon to admire the art which has surmounted the difficulties presented by so small a stage. To obviate this, and give the apparent size of the interior, a side view of the Syracusan theatre is taken, and the floor of the stage is entirely covered with an imitation pavement in sharp

perspective, which completes the illusion, and deceives the eye completely as to its true extent. The vast area filled with people is only partially developed; and the spectator is insensibly led to carry out mentally the entire conception. We think this one of the highest points of this art-play.

It is, however, in the fourth act that the strength of scenic appliances as regards machinery and masses of performers, are brought most prominently forwards; and certainly the stage has never presented a more exquisite realisation of a poetic conception than the ascent of Phœbus in his quadriga,—the light breaking forth from the god as he dispels the fogs of night, and bursts forward, hardly roining his dashing steeds in a blaze of glory; this is a noble realisation of Flaxman's design in the centre of his Shield of Achilles, which that artist embodied from the antique. The palace of Polixenes, which follows this scene, is remarkable for its barbaric splendour, and the contrast it affords to the purer Greek taste. The shepherd's farm is an exquisite realisation of a picture from Pompeii; but the crowning beauty of this act is the pastoral scene in Bithynia, overlooking the Lake Ascania, with the range of mountains known as the Mysian Olympus beyond. A sweeter picture of pastoral happiness was never placed upon the stage than this, with its umbrageous trees, from which Bacchic masks are suspended; its cool fountain gushing from the rocks; the terminal figure of Dionysus in the centre, and the peasantry with their lambs and goats in the foreground. The wild orgies of the Festival of Dionysus which succeeds, gives us a new phase of antique life; and never was "the riot of the tipsy Bacchanals," more wild and noisy than here represented. At one moment the whirl of the thyrsus and wine-cup over the head of each mad reveller produces an effect of reckless jollity; anon all join hands, and with half-shrieking shouts, rush toward the figure of the god in exuberant recognition amid the clangor of cymbals and burst of pastoral music. It is a realisation of scenes such as antique gems or the pictures of Poussin only give.

The opening scene of the fifth act represents the garden of the palace of Leontes, and has been adapted from a drawing found at Herculaneum. In the last scene, "the peristyle of Paulina's house," Mr. Charles Kean has shown much originality and taste. The unveiling of the statue takes place at night, and the darkness is but partially dispelled by the flickering torches of the attendants. Nothing can be more poetic than the figure of Hermione, lighted by a ray of pale light. It is life reduced to statuary, and we can appreciate the feeling of the sorrowing Leontes, and share his astonishment when the marble "moves." The repose which reigns throughout this scene, and is not dispelled till the curtain falls, is beautifully in character with the close of the drama, and the poet's conception.

In this, as in other of his revivals, Mr. Charles Kean has called in the assistance of able artists not usually connected with the theatre. Mr. George Godwin has superintended the architectural portion of the scenery, and Mr. George Scharf the landscape and costume; Mr. Davies and Mr. Hatton have endeavoured to realise the old Greek music. It is this travelling from the beaten track which gives pre-eminence to Mr. Kean's scenic accessories. The scene-painter, property-man, and stage dressmaker, some years ago reigned supreme within the walls of a theatre, "their right there was none to dispute," and no scholar, however well versed, might interfere with their conventional notions. What they made of Greece and Rome may be seen in our old dramatic prints, which are extraordinarily curious in consequence; but what may be done with the stage, when the resources of taste and scholarship are brought to bear upon it, may be seen in the Princess's Theatre under Mr. Kean's more judicious rule.

The gratitude—not only of "playgoers," but of all lovers of Art, and, indeed, of the public generally, is largely due to Mr. Kean: he has made the drama to answer its high and legitimate purpose—to teach while it gives pleasure.

ART IN THE PROVINCES.

MANCHESTER.—The Exhibition of the "Manchester Institute for the Promotion of the Fine Arts," will open early in the autumn. It would seem almost superfluous to call the attention of artists to this announcement; the manufacturing districts generally, and Manchester in particular, have become the chief depositaries of modern Art, and there pictures of any merit are sure to find purchasers. But the committee of the institution not only desire to have unsold works, but they ask from collectors the loan of those which are in their possession, so as to enable them to form an extensive and interesting exhibition. Surely there are many of such patrons who would be pleased to part with their treasures for a few weeks to assist in this object, for after all the "strength" of the exhibition must depend on the assistance which may be afforded in this way, for we apprehend few painters of any standing in popular favour have pictures at their disposal. Mr. Edward Salomons, architect, of Manchester, is the honorary secretary of the institution, and has been in London during the past month arranging for the transmission of contributions, and has we believe, met with very considerable success; but there will yet be a large space in the gallery to fill up.

We noticed in our last number a project for opening at Manchester a grand Exhibition of Industrial Art; a deputation consisting of the High Sheriff of Lancashire and several influential gentlemen of the county had an interview, on May 8th, with his Royal Highness Prince Albert, to submit the project for the approval of her Majesty and the Prince. A sum of 60,000*l.* was, we understand, subscribed within a few days, in Manchester and its vicinity, as a guarantee fund for carrying out the exhibition on a scale commensurate with its importance.

The annual meeting of the Manchester School of Art was held at the Royal Institution on April 25th; Mr. Edmund Potter, president, in the chair. "The chairman," writes the *Builder*, "regretted the want of support under which the school languished, its existence being supported chiefly by a few friends instead of the public at large; and he should be glad to see the Royal Institution take the school by the hand, and relieve it from its heavy rent of 200*l.* At present 1000*l.* a year were spent in educating 200 or 300 pupils, which was too much, though the education was of a high quality. The receipts were nearly equal to the expenditure: the subscriptions were about 300*l.* a year. About 100 pupil teachers paid 3*s.* a quarter. The secretary read the report. Efforts were being made to extend the benefits of the school by establishing a class for artisans, and by giving instructions in public schools at a low charge. Mr. Hammersley, the head master, reported that the school had maintained a steady course of improvement, the studies of the pupils being more numerous, and of a higher quality than before. In the first quarter the pupils numbered 458, in the proportion of 363 males and 95 females; second quarter, 194; third, 181; fourth, 204: total, 1037, or an average of about 250 per quarter. The school fees amounted to about 200*l.* The Government grant was 380*l.*; annual subscriptions, 295*l.*; making, with private donations, school fees, &c., about 1000*l.*; and there was a balance owing of 374*l.* Mr. Bazley regretted the withdrawal of a portion of the Government grant, which was last year 220*l.* less than it used to be. It would be disgraceful if such a useful institution lacked support."

BRISTOL.—The annual meeting of the members and friends of the Fine Art Academy was held on the 1st of May. The attention of the assembly was chiefly directed to the new building now erecting, which the President of the Academy, Mr. W. S. Miles, stated was proceeding satisfactorily. The committee hoped that in the course of the present year, about September or October, the roof would be put on, and that at this period next year the annual meeting, not only of this institution, but of the School of Art and the Society of Architects, would be held within its walls. The architectural portion of the work had been done entirely by the Society of Architects gratuitously. In the original design, the building was intended to be erected in a much plainer form than had since been thought desirable. This alteration was made at the suggestion of Mr. Thomas, of London, the sculptor. The five windows will be filled up with different groups of sculpture. Mr. Tucker read the report, which alluded to the services of Mr. Underhill and Mr. Hunt, the two architects who planned and designed the building. The elevation of the edifice is in the Italian style, from four designs by Mr. Hunt. It is approached by a double flight of steps, leading into the vestibule. The building will contain

spacious exhibition-rooms, and a room appropriated for the requirements of the Fine Arts Institution. Accommodation will also be provided for the School of Practical Art. The principal front will be ornamented with emblematic groups, designed and executed by Mr. Thomas, provided the necessary sum can be raised by independent subscription.

BATH.—The fourth and last conversazione for the season of the "Bath Society for the Promotion of the Fine Arts," took place on Tuesday the 15th of April; the principal pictures exhibited on the occasion were 'The Brave Old Hound,' by ANSDALL; 'Ewe and Lambs,' by VERBOECKHOVEN; 'The Child Timothy' and 'Saxon Woman,' by SANT; 'Coast Scene,' STANFIELD; 'Coast Scene,' W. COLLINS; 'View on the Eastern Coast,' BRIGHT; 'Death of Robert, King of Naples,' ELMORE; 'In the Forest,' CRESWICK; 'Jedburgh Abbey,' D. ROBERTS; an 'Interior,' F. GOODALL. In the rooms were also paintings and drawings by BRANWHITE, H. B. WILLIS, ETTY, SOLOMON, HERRING, J. GILBERT, COX, WARREN, HARDING, F. TAYLER, and portfolios of sketches by BENNETT, JENKINS, AYLMER, W. MULLER; and some beautiful flower subjects by MRS. DUFFIELD; these pleasant and instructive *réunions* owe much of the success which has attended them to the exertions of the husband of this lady, Mr. W. DUFFIELD, himself an excellent flower-painter.

CLIFTON.—*Clifton and Bristol Graphic Society.*—The last meeting for the season of the Clifton and Bristol Graphic Society took place on Tuesday, April 22nd, at the Victoria Rooms, Clifton. It was very numerously attended, there being about four hundred and sixty persons present. Mr. Miles sent a magnificent picture of the "Adoration of the Virgin," by Velasquez; Mr. Jacob Bell contributed Sir E. Landseer's "Horse Shoeing;" Mr. Munroe, a fine picture by Turner, called the "Rainbow," &c.

WORCESTER.—Preparations are being made by the Worcester Society of Arts to hold its third annual exhibition; and artists willing to contribute are invited to send in their pictures before the 6th of August. We may remark that the sales effected by this society last year were nearly double those made by it in the first year of its establishment; a fact which entitles it to the consideration of artists.

EDINBURGH.—A society, entitled "The Photographic Society of Scotland," has recently been established in Edinburgh, with Sir David Brewster as its president. It already numbers eighty members, with every prospect of a large addition.

THE ROYAL PICTURES.

THE QUEEN'S HORSES.

J. F. Herring, Painter. C. Cousen, Engraver.
Size of the Picture, 2 ft. 1½ in. by 2 ft. 3 in.

A PECULIAR feature of our national character is a strong attachment to domestic animals, especially to horses and dogs. This feeling pervades, in a greater or less degree, every class, from the nobleman or country gentleman, who possesses his stud of racers, or of hunters, or his pack of deep-baying hounds, to the poor mountain shepherd whose colley keeps solitary watch with him day by day on the hills, or the wandering gipsy, whose donkey carries on his back the whole household wealth of the family, and asks no other shelter from the night-dews of heaven than the canopy of the thick-leaved oak, under which his master's tent has been pitched till the rising of the new day's sun. This national feeling has had its effect on our school of art, by calling into existence a few painters who have made it almost a special business to become portrait-painters of animals, because there are few owners of a favourite horse or dog, who are not desirous of seeing him represented on the canvass of the artist; hence have arisen Landseer, J. Ward, A. Cooper, Ansdell, Herring, Barraud, and others.

Mr. Herring is among that class of artists who, by the strength of their own innate genius alone, have raised themselves from comparative obscurity into fame and distinction; and in his case this result has been realised without any of those early indications of talent which "cast their shadows before." It is, we believe, about forty years back that he left the metropolis for Yorkshire, without any especial object in view; but a fondness for animals in general, and for horses in particular, and a strong desire to "handle a team" of the latter, induced him to occupy the driving-box of a stage-coach; an ambition which, at that period when the glories

of the turnpike-road were at their zenith, was exhibited by not a few of our aristocracy and wealthy commoners. How it was he imbibed a taste for painting we do not know, but it is certain that he filled up his spare hours at this time by making portraits of the favourite horses which came under his guiding rein; and that he painted them and drove them with equal skill, his constant association with the animals making him a perfect master of their forms, habits, and character. His position on the box,—it was the famous York "Highflier," we believe, which he drove—and his success in the department of art he practised, introduced Mr. Herring to the notice of many individuals noted on the turf and in the chase, by whom he was frequently engaged to paint portraits of their horses.

This artist very rarely exhibits at the Royal Academy: he was one of the earliest supporters of the Society of British Artists, in whose gallery and in that of the British Institution his works may annually be seen. The picture here engraved was a commission from the Duchess of Kent, to be presented to her Majesty on her birthday. Her Royal Highness was so pleased with it, that she appointed Mr. Herring her animal painter. The Queen also testified her approbation of the work, by commanding the artist to paint a portrait of a favourite black horse, the picture being a present from Her Majesty to Prince Albert on his birthday.

Of the two horses which appear in the engraving, the darker is a beautiful chesnut, named "Hammon;" he was bred in the stud of the King of Prussia at Trakehn, and was presented to her Majesty by the King in 1844. Though the animal is now nearly twenty-two years old, we are assured by the Queen's riding-master, M. Meyer, that he is as fresh as a "four-year-old." The grey horse is called "Tajar;" he was bought by M. Meyer in 1844 of Count Hatzfeld, having been reared at Twenark in Mecklenberg, by Count Hahn; his age is about a year beyond that of "Hammon;" but, like the latter, he is as fresh as ever. Both horses are of pure Arab sires. "Tajar" is still used by her Majesty when she takes horse exercise in the riding-school. They are represented as standing at one of the private entrances to Windsor Castle.

The Picture is in the Collection at Osborne.

THE NEW STATE ROOMS AT BUCKINGHAM PALACE.

THE additions recently made on the southern side of the palace consist chiefly of such apartments as are devoted to the elegant relaxations of life, and comprise a ball and concert-room, with its necessary refreshment-rooms and corridors. These have been constructed by Mr. Pennethorne, and the decorations carried out under the general superintendence of Mr. L. Gruner. We should naturally expect the home of our sovereign to exhibit the refinement which characterises modern taste, and that adaptation of sculpture and painting to in-door life which is now recognised as an addition to its *agremens*. It is therefore found in these new rooms, and we gladly hail its recognition where it can be so well appreciated, and aid in spreading such taste elsewhere; the court naturally giving the tone to fashionable life.

The rooms are reached from the grand staircase; this is lighted by lamps elegantly designed by Osler, and we especially admired the taste which grouped with them branches and leaves in the same fragile materials, giving the lamps the effect of bouquets of glass flowers. A gallery at the summit of the staircase leads to the music-room; this gallery is decorated in the Italian manner of the cinque-cento, the walls being painted to imitate an open arcade, looking out upon the sky, birds hovering over the flower-vases which occupy the centre of each opening. The panels above them are decorated with pictures *en grisaille* of groups of children. In front of each pilaster a series of variegated marble pedestals support busts of classic form, by Mr. W. Theed. The banquetting-room to the left is

a domed apartment, the walls panelled as if with variegated marbles, alternating with panels filled with copies of Raffaele's arabesques in the Loggia of the Vatican. The same great artist's "Cupid and Psyche" has contributed the subjects for Mr. Theed's *bassi-rilievi* on the two sides of the apartment, forming a frieze over all. Gas lustres of very elegant but exceedingly unobtrusive form, and looking rather like pendant ornaments, occupy the corners and centre of the ceiling, and diffuse a warm glow over the harmonious walls. The large buffets on both sides of the room, and the busy scene on the floor, make an effective picture on ball nights. A small gallery from the dining-room affords a private entrance for the Queen and court, and its walls are also Raffaelesque in character; the semicircular curves above each door are filled by two charming designs by Theed, representing "The Birth of Venus," and "Venus bringing Armour to Achilles," both executed in high relief, and having a powerful effect by the purity of their colour and form, and the depth of shadow they afford, relieved as it is by the brightness of tint surrounding them.

The ball and concert-room is the crowning point of the new additions; and this, as it should be, is the most important scene of the labours of the Art-decorator. The floor is laid in *parquetage*, the walls are hung with rich silk, the pattern on which combines the national flowers of the United Kingdoms. Above are paintings of the hours from sketches by Raffaele, and Cupidons from his frescoes in the Farnesina Palace. The top and bottom of the room have arched recesses; that at the top is fashioned to contain the royal seats, and is decorated with columns and figures in the richest taste, emblematic of the era. The opposite recess is devoted to the vocalists and the organ. The case of the instrument is designed in the best taste of Italian renaissance, with seated figures on its summit, emblematic of music. The ceiling of the room is highly enriched by ornament, coloured and gilt, and from each of the sunken panels descends a gas-lustre. Standard groups of wax-lights on enriched pedestals occupy the corners and sides of the room, all deep and positive colours being reserved for the seats which surround it. In the entire direction of the whole, Mr. Gruner has reigned supreme, and his taste has secured the general harmony where so many have been employed. Mr. Theed, and Canzoni, of Rome, have been the artists principally employed. Mr. Moxon has executed the marbles and gilding. The candelabra have been designed by Mr. Gruner, and perfected by Barbedienne. The silk on the walls is produced by Jackson & Graham, the furniture by Johnstone & Jeanes, and the carpets by Lapworth. The lustres by Osler, of Birmingham.

It will thus be seen that English Art-manufactures decorate the new rooms of England's Queen, and it is with no small degree of satisfaction that we can point to so successful a result. The decorations of a royal palace are too frequently the exposition of an exploded fashion, and it is not often that modern experiences are brought to bear on its arrangements. The great beauty of the present suite of rooms is its successful display of modern educated tastes—tastes which result from the study of various styles, and the happy adaptation of the best parts of all. The air of repose, as well as richness of fancy, which reigns over all, is the great charm of the *ensemble*, but we think its general elevation in no small degree results from the happy character of Mr. Theed's statuary and *bassi-rilievi*; these, by their purity of form and graceful contour, give boldness and vigour to the general design of the apartments, which no flat painting could effect. We should rejoice greatly if our sovereign be enabled to aid the somewhat neglected art of the sculptor, by thus exhibiting its applicability as a tasteful adjunct to the noble homes of England. So far from its being "cold" and "monumental," it is here proved to be the reverse, and we hope to see the happy example followed. The good taste of the Queen and her august consort has never been more fully displayed than in these additions to their home—so happy a guide to every other home in her dominions.
